of the hinterland.

Inside a home

high mountain ridge, they must be at home to cook the night meal On the way to the farm and back, a longish track up and down hills, her hands are busy spinning on a simple spindle, or weaving an intricate grass garland Nightfall is at six.

This land demands simplicity, courage, hard work But what overwhelms a visitor is the highlanders' hospitality A guest among the Adis is plied not only with food and drink but with song and dance also. The girls line up at his arrival and sing the *Ponung*, the welcome song. At departure, they sing again, but with the lilt gone, their gladness of heart replaced with sober thoughts of the perils the traveller might encounter on his

Reaffirming Faith in the Power of the People

PRIME MINISTER CALLS FOR POLL VERDICT

IT IS SOME time since I last spoke to you on the Radio. However, through my continuous travels in various parts of the country and through the groups and large number of individuals whom I meet in Delhi and elsewhere, I have continued to be in close touch with you all. Your support, your affection and your trust enable me to serve India to the best of my ability

On my journeys up and down the country I have been glad to find that our people have shaken off the sense of defeatism and gloom There is a new pride in being Indian. Indeed it can be said that in the year just completed, the nation has rediscovered its sense of purpose and its potential strength.

Some eighteen months ago, our beloved country was on the brink of disaster. Violence was openly preached. Workers were exhorted not to work, students not to study, and Government servants to break their oath. National paralysis was propagated in the name of revolution. The democratic way would have been to work towards the next elections, which were not far off.

Government had to act and did act. Without purposive Government, a nation, specially a developing one, cannot survive. At that time I made it clear that the restrictions imposed would be temporary. They have been gradually eased. The leaders and many of the rank and file, who had been detained, have been released For some time past Press censorship has been relaxed and newspapers have been reporting the activities of people and Parties. Restrictions could have been lifted earlier, had violence and sabotage been given up, had there been no attempt to stir up communal and other unrest.

This discipline and feeling of hope enabled us to initiate and pursue many policies to help those sections of the population who had not greatly benefited from development plans. The Constitution has been amended to remove impediments to policies which are designed to serve the people We have also undertaken programmes to combat social evils such as dowry, which is a burden on our middle classes, and family planning, which aims at healthier and better-cared-for children. Any act of compulsion or harassment will be dealt with severely

May I remind you that the Emergency was proclaimed because the nation was far from normal. Now that it is being nursed to health, we must ensure that there is no relapse.

Normality means the orderly conduct of business. This is possible only if people live by certain codes and norms of behaviour. Democracy also has certain rules. Government functioning cannot be obstructed. None should imperil the welfare of any section of the people or the safety of the nation. If India is to live and prosper, there can be no preaching of hatred, no practising of violence, on encouragement of subversive activities, or lowering of standards of public life.

The economic situation has vastly improved. Others are studying our anti-inflation strategy. Production has increased, thanks mainly to the new spirit of dedication which we see in our farmers, in our industrial workers, and in our scientists, technicians, managers and administrators. The public has co-operated

inspite of difficulties. We have resumed work on many development plans which had been interrupted by the economic crisis and political disturbances. The Twenty-Point and Five-Point Programmes have shown tangible results. Even though much remains to be done, they have generated an attitude of confidence, and have galvanised young and old. In spite of criticism, there is a new respect for our country abroad.

I am conscious of the difficulties which farmers, industrial workers and some other sections of our population are experiencing. We are studying each problem so as to find quick solutions. Cyclone, drought and floods have caused hardship in some areas. My sympathy to all those affected. In recent months prices of a few commodities have slightly increased. But we have already initiated corrective action, which will soon show results.

We have the largest grain stocks in years. Elements which wish to stir up economic trouble will be sternly dealt with. As long as there is close co-operation between Government and the people, our economic battles can and will be won.

Anyone can see that today the nation is more healthy, efficient and dynamic than it had been for a long time. The question now before us is how to restore substantively those political processes on which we were compelled to impose some curbs.

Change is the very law of life. This is a time of great fluidity in the world. Contemporary society is beset with dangers to which developing countries are especially vulnerable. Hence all change must be peaceful. This is the legacy of our freedom struggle and of Mahatma Gandhi and Jawaharlal Nehru .

Our system rests on the belief that governments derive their power from the people, and that the people give expression to their sovereign will every few years, freely and without hindrance, by choosing the government they want and by indicating their preferences for policies. The government so chosen has their complete mandate to carry out such policies.

The present Lok Sabha was elected in 1971. The clear-cut mandate of the people enabled the country to meet a combination of challenges—those created by the events in Bangladesh, by the international economic crisis, by the drought of 1972-73 and by the political events of 1974-75. Legally, the present Lok Sabha can continue for another 15 months.

But we also strongly believe that Parliament and Government must report back to the people and seek sanction from them to carry out programmes and policies for the nation's strength and welfare.

Because of this unshakable faith in the power of the people, I have advised the President to dissolve the present Lok Sabha and order fresh elections. This he has accepted. We expect polling to take place in March.

The rules of the Emergency are being further relaxed to permit all legitimate activity necessary for recognised parties to put forth their points of view before the people. I earnestly counsel political parties to eschew violence and refrain from vilification a calumny. People should neither believe in nor give currency to rumours and gossip.

Every election is an act of faith. It is an opportunity to cleanse public life of confusion. So let us go to the polls with the resolve toreaffirm the power of the people and to up hold the fair name of India as a land committed to the part of reconciliation, peace and progress.

My good wishes to you. for the people of India, may 1977 prove to be a year of added stability, strength and continuing achivement. ☐

A YOJANA *Survey of a people and a land leaping the centuries into modernity*

Text : SIDDHARTHAN KARIYAL
Photographs : P.K. KAPOOR

LIKE MESOZOIC REPTILES looked in mortal combat, the hills of the Lesser Himalayas march against the sky.

Young and still growing, these hills are meat for vegetation and not for usurping man. Yet successive waves of humanity came here, Tibetans from the north, Tais from the east and many races of plains people from the south have commingled and have made these mountainous belts of snow, pine and torrid rain forests their homes for centuries.

And for centuries they were held captive by the hostile environment. Their success in getting a foothold in the hills was also their undoing, for the arduous task of ekingout a bare living from the eternally moist, cold, steep, forested undulations have left them with no surpluses of *elan vital* to roll on to the next stage of development and civilization. Today, because of the forces of geopolitics, the half a million tribesmen and women of Arunachal Pradesh are being helped by the rest of their countrymen to overcome the limitations of history and terrain to leap the gap of centuries, to adopt modern agricultural practices in the place of jhoom' cultivation given up by their cousins in the plains over 10,000 years ago.

Because hill and river cut off a community from its neighbours the people of Arunachal are divided into several tribal groups. Modern engineers cutting strips on the forested mountainsides and turning them into roads fit for wheeled traffic seek to put an end to this ancient isolation. With the dawn of awareness, entire tribal groups living in the more accessible regions of the vast territory are now anxious to forget their disparate nomenclatures and come under one unifying name Many tribe names simply mean 'man' in the tribal languages, they point out. *Nepak*, the plain-dweller, Nemae the plateau-dweller, and *Nishi*, the hillsman, says a welcome song of the Adis may be different because of their speech and letters; yet they are all brothers, sprung from the same father. Endowed

A. Nishi Village

vith rich traditions and myths, al-
nost all the tribes believe in a universal God, the brotherhood of man estifying to the Fatherhood of God.

Despite the fact that in the past enturies the mountains have won against man here, these people have reated enduring beauty in their nyths and songs, and vigour in their rafts and dances. Tantrism in its ntirety is supposed by some anhropologists to have come from the orth-east to Hinduism; in today's ive-and-take, the plainsman, the *Hariyang* and the *Aying*, can give hem the technology to tame the hills nd rivers, and take in return from he hillsmen faculties he himself as lost: a highly evolved attitude owards nature and beauty, to community organisation and cooperaion.

Travelling some 3,000 kilometres in jeeps, wading through mountain streams and climbing hills, never sleeping for more than two nights in the same bed, *Yojana's* Chief Editor S. Srinivasachar, Correspondent Sidharthan Kariyal and Photographic Officer P.K. Kapoor undertook a whirlwind tour of the Union Territory for three weeks and saw the people at close quarters. Everywhere they enjoyed their spontaneous hospitality, shared their rice beer and fried chicken and tried to measure the impact of the past two decades on their isolated lives.

Perhaps, no other region of India has as varied a tapestry of peoples as Arunachal. The Monpas with their Buddhism brought to them not from India but circuitously from China and Tibet; the Khamptis who assimilated the same religion by way of another circuitous route, Burma; the Wanchos living in a cold, wet region but almost alien to clothing, yet bringing forth surprising beauty from their loin looms when dyed cotton is made available to them; the Apatanis withdrawn in their 22-square-kilometre plateau but reaching out to become jet pilots and administrators; the Sherdukpen with their produce marching off to the distant plains every year to meet with immemorial friends; the Nishis exuberant in the face of the forbidding frown of the hills; the Adis, the Mishmis, the Tangsas, the Tagins, the Noctes and many more.

The team brought back eight kilogrammes of typed and printed basic information, over 800 photographs, and impressions to last a lifetime.

The World's most Expensive Civil Supplies operation

COMMUNICATION AND MAINTENANCE

EXCEPT FOR THAT memorable crashlanding, for years now there has been no major accidents. And the details of that breathtaking bellyscratch spell out the full extent of danger the IAF pilots face in these hills on all days of the year, except on Republic Day, Independence Day and on Mahatma Gandhi's birthday.

With a full load he flew the *Caribou* in a narrow valley between a range of high hills An experienced pilot, he kept a peeled eye for any sign of deterioration in the weather. The slightest doubt and he would have taken the plane high above the hills for a turnabout and return to base. If the weather should pack up, as it often did, after landing, it would have meant an indefinite stay on the remote airstrip till the sky cleared up once again.

The landing was going to be trickier than the flying through the narrow valley. The strip was laid out on the belly of a hill and both ends of the runway suddenly fell off into deep precipices There was no room for any error in judgment. From a thousand feet in the air, the pilot had to aim the nose of his plane, like a sharpshooter in the Olympics, at one of the two parallel lines etched on the edge of the pre cipice. The plane's front wheel had to touch the line marked in front, and the rear wheels the line at the back. That precision, and that alone, would ensure that the plane would stop sufficiently short of the other precipice at the far end of the runway.

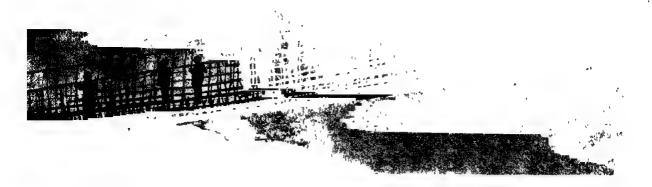
As it happened, the marksman in the cockpit missed his aim that time. The front wheel, instead of coming down on the front line, touched the rear line. The rear wheels of the *Caribou* hit the edge of the precipice and were ripped off. The plane careened to a screeching halt amidst a furious spray of sparks flying from the tarmac....

Air dropping of Civil Supplies by a Dakota in a remote ivilage

After that the IAF has decided that it is easier to walk there than fly there.

Easier? Those who have to do it on 14-day or 18-day foot marches are unlikely to agree. Sometimes the narrow tracks suddenly end at the foot of a tall bamboo ladder. One has to climb the ladder 20 or 30 feet to reach another ledge. The path then leads for a few hundred yards more and once again comes to a sudden halt at the foot of another rickety ladder. Since mules cannot climb ladders, man has to take his own buden on such routes, and there are many such in Arunachal.

If bamboo ladders kept leaning on mountain brows fail to unnerve you, this land of hills and rivers has a few more tricks up its sleeve. The hanging bridges of Arunachal made of cane and indigenous engineering skill look very romantic; in a photograph. Walk on it for 20 feet of its 200 feet overall length, and a sickening swaying begins A hundred feet below you can see every single rock and pebble in the clear bed of the river if it is winter, and a boiling fury of raging waters if it is summer.

Once a Jawan of the Assam Rifles fell through a gap in one such bridge in summer, and his companions recovered his body 20 km downstream. On another occasion, a band of marching officials, all greenhorns, started walking up the bridge in Indian file. There was no local citizen around to warn them that such bridges are taken by one man at a time. Half way through their weights proved to be too heavy and the bridge with its human load came crashing into the shingle bed of the river. Half the marching team ended up with bandages in a hospital, and it had taken their companions a week to carry them there. These


A hanging bridge connecting two hills with a river flowing below in the gorge

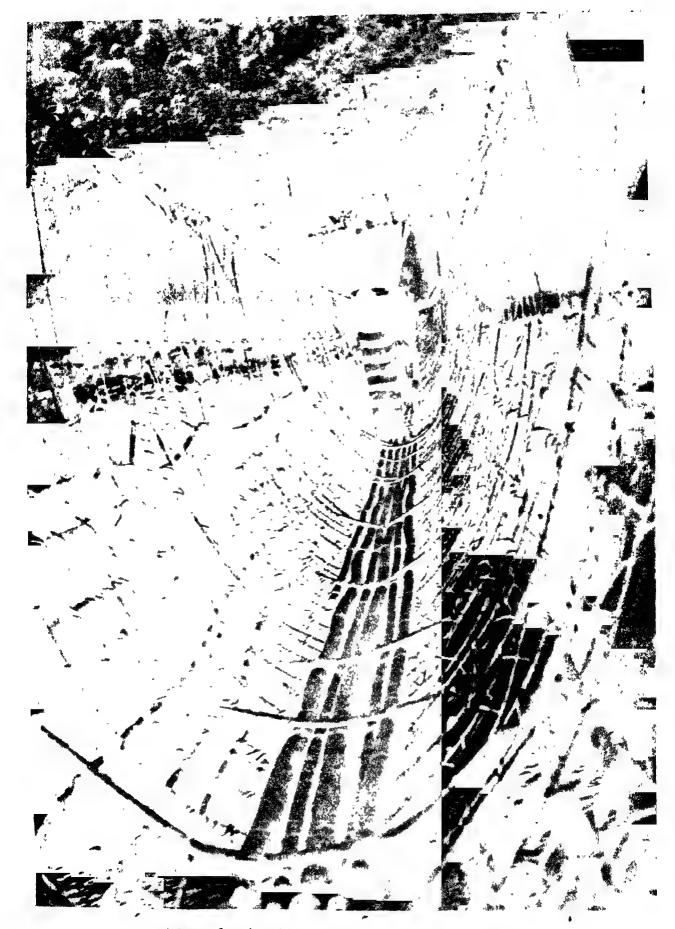
'ays the Government supplies steel ables to strengthen these bridges ınder the Community Development chemes

But there is one category of bridges ›eyond the scope of steel cables in \runachal. It consists of a single trand of a stout cane strung across ı river, with three hoola-hoops ıanging from it. The trick is to .rrange your body as safely and com- ortably as possible in the loops, ıtter a loud prayer, and give a nighty kick to the trunk of the tree vhich supports the cane trapeze. f the prayer and the kick are effec- ıve, you fly to a point somewhere in he middle of the river. From the niddle to the other bank it is your ›are hands that will pull you across. \lthough callouses on the hands are ıseful on such occasions, callouses ıll over the feeling parts of the psyche vould be even more helpful.

The Government of Arunachal, ve were told, were too scared to 'ontemplate the modification and mprovement of these bridges with teel cables, dismissing them as elics of a mad age which had better :nd in more civilized ways. But the 'illage folk loath to walk half a .ilometre upstream where the cross- ng would be simpler on the ground, ›refer the trapezes to civilized pedes- trianism. And these bridges are here to stay, mostly in Lohit.

But these are minor obstacles ompared to what the Digaru and he Lohit do to communications in \runachal's Lohit district. Until he day the earthquake in 1950 shook up these hills, locals say, the Digaru and the Lohit were no more unmannerly than any other moun- tain rivers. After that cataclysm, both the rivers have gone completely berserk. The Lohit even wiped out Parashuram Kund famed through Hindu mythology. At that point where the river enters the plains from the hills, its madness gives rise to one of the most magnificent sights on the face of the earth. The turbu- lent river, so far confined to the steep banks of the hills, finds itself free and spreads itself out in dozens of arms encircling hillocks, islands and clumps of trees. It spends itself for miles like this before becoming a single river once again

On the road to Tezu, Lohit's headquarters, the mindlessness of the Digaru has made for herself a bed one kilometre wide. But on any particular week of the winter months, her body shrunk to a mere fifty metres, she may be occupying any part at random of the kilometre- wide stretch. no one can predict her lay One outcome of this is that engineers are unable to build a road here. One engineer at Tezu, however, hazarded that he could build a bridge here, if not a road, provided the Planning Commission would agree to the expenditure on a span of 15 kilometres, a span wide enough to cross the entire devastated stretch.

A new bridge built in Passighat for the benefit of students going to the University. This bridge was built without the help of cranes and other heavy equipment in a record time of about six months by the C.P.W.D


A close-up of a semi- circular cane bridge built by local people to span two hills.

May be when Arunachal is no longer dependent on this penny-pinching Commission, she would build it, after all! Tezu needs it.

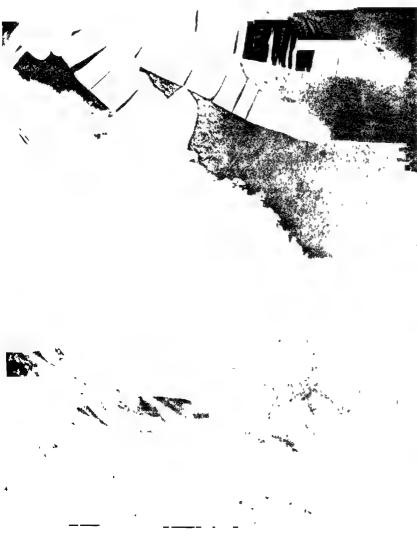
The jeep goes into four-wheel drive and inside it feels more like jumping, grasshopper style. That is the only way to reach Tezu in winter. In summer elephants take over, and Imtiaz Khan, Lohit's young Deputy Commissioner, has to journey this stretch on his way to a meeting at the capital at Itanagar and back to his HQ, like Hannibal on the Alps. Water comes to the very eyes of the brave, surefooted beast picking its careful way, its trunk held aloft, its stoutness resisting the strong current

Elephant, *Caribou,* trapeze-bridge and overused jeeps that suddenly expire in the middle of the forest road- the hazards have not discouraged Arunachal administration from reaching out to its remote outposts. As many as 35 stations, with full administrative machineries in 23 of them, are maintained entirely by airlifted supplies This is

Packaging supplies to be air-lifted is an expensive operation Picture above shows foodgrains being packaged for despatch

Crossing the Lohit or Digaru during floods is hazardous and time consuming In summer the crossing is often done on elephant back.

Above : Packed supplies are being loaded into trucks at Mohanbari to be taken to the airport for dropping operations

Below . The Subansiri river as it roars its way down the valley The surrounding scenery is fantastically beautiful and awesome.


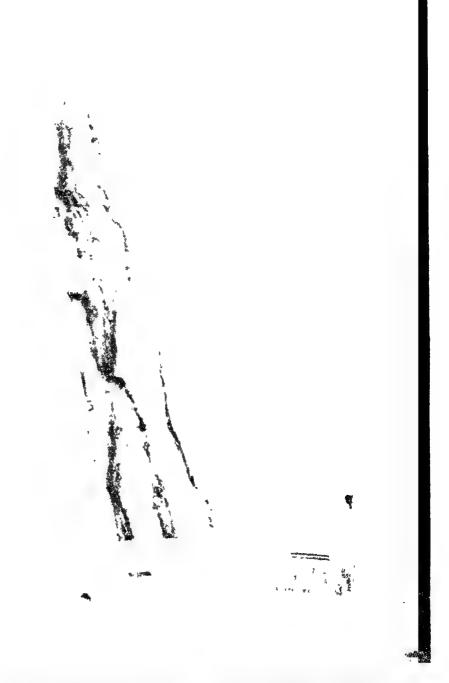
reputed to be the largest and the most expensive ongoing peace-time air maintenance system anywhere in the world. On the average it costs the government Rs 12 to lift a kilogram of supplies, but expenses could vary widely depending on aircraft used and the location of the dropping zone. Everything from salt to equipment needed by surgeons in the operating theatre are packed according to established air force specifications and kept ready in large warehouses for the pilots to lift according to schedules determined by weather conditions and availability of aircraft.

Whether it is meat on the hoof (goats crated in cages) or galvanised iron sheets or petrol in jerry cans, there are precise ways in which a cargo has to be packaged for a sortie. Grain, for instance, is packed in successive layers of jute bags, one inside the other, five bags for a 50-kg weight and four bags for a 40 kg weight, to resist the impact of a free drop from 200 to 400 ft height. Two types of cotton parachutes are used for more delicate goods, a 28-ft parachute costing Rs 600 for a 150- kg load, and a 18-ft one costing Rs 250 for a 65- kg load. Even a minor flaw in folding a parachute can result in loss or damage. Gangs of packers, 80 of them under a dozen inspectors, prepare the chutes and pack the material throughout the year with only three breaks mentioned at the beginning of this report, to keep the outposts supplied every month with a total of 1,500 quintals of rice, 400 quintals of flour, 225 quintals of sugar, 200 kg of salt, 300 quintals of lentils, 50 quintals of tea, 12,000 litres of kersosene, 1,000 litres of petrol for the generating sets, 5,000 litres of motor oil, besides canned milk, canteen items, medical and engineering stores, pesticides and mail. Each station is expected to maintain at least six months' supplies to meet emergencies. These days, sorties have ceased to supply the outposts with fresh vegetables or meat for the families of men out there who are expected to fend for themselves as far as these items are concerned. The result is that people pay, when fed up to the gills with grain and lentils, as much as Rs 40 for a scrawny chicken or Rs 600 for a small goat when villagers are prepared to sell them. Despite elaborate planning and precautions, an aircraft may dump all rice and no lentils, or *vice versa,* to a settlement and there are occasions when frantic messages are received for help over the wireless network. The

HQ also gets messages notifying the 'death-throes' of oil lamps expiring of 'thirst'. Since everyone in Arunachal is only too well aware of what could be the situation when an outpost runs out of kerosene for its lamps, the HQ does not take offence at such liberties taken with official correspondence', and does everything to keep the lamps in smelly good health.

The worst is when a sad message from a distant home reaches a wireless office. The message can be quickly transmitted to the addressee all right, but there is precious little he can do on receiving it. Before the Brahmaputra bridge was built in Assam, ferries used to transport entire trainloads and the journey used to be resumed from the other bank by another train. In one flood season, an Arunachal official came to his side of the bank to receive his vacationing sister arriving from the other bank. They waited two weeks, for the ferry to resume, but there was no sign of the water subsiding. Finally, time ran out for both the brother and the sister, and they had to call it a day and return home without meeting with each other In Assam now, such stories are heard, no more but in Arunachal people still live in forced nonchalance in many isolated places.

The enormous task of ending this isolation can be completed only in generations, not in the life Span of an individual. A satellite photograph of the eastern lesser Himalayas printed elsewhere in this

In Arunachal women work hard, fetching water and fuel from the forests


As the traveller jeeps his way up or down in Arunachal the spectacles of streams cascading hundreds of feet below is a frequent occurrence. During rains these cascading rivers can become real road blocks.

journal captures in one broads weep as no words can, the impossibly undulating nature of the terrain. If we keep in mind while viewing this picture a basic fact of history, namely, that neither the Chinese, nor the Mauryas nor the Guptas nor the Mughals nor the British, all mighty imperial powers, ever ventured into these hills beyond a point, and allowed the human settlements there to carry on as best they could without the benefit of *pax Britannica* or whatever rule of law, then the task set before our development administrators becomes one of truly historic import; they are pioneers where none of their like had ventured before. But then imperial powers and a democratic republic are not of the same like, either. The British had created an 'Inner Line' in the north-eastern frontier of their colony and had ventured beyond it only occasionally. Their flag-showing marches were more in the nature of authorised brigandage than civilised administration. (The inner line exists today, to keep latter-day brigands out). Even hardy missionaries eager to

of social evolution or in material culture.

The peculiarities of life struggle in the hills are unique. Absence of any extensive level ground means that the people have to cultivate the running slopes themselves. Economists and agricultural experts with the hindsight of several centuries of experience to guide them condemn the practice of jhooming as wasteful and extravagant but the hillsman has little choice. Cutting the forest and setting fire to the undergrowth to make a clearing for a farm works out far cheaper and easier than terracing when human labour is so precious and scarce But this precarious agriculture gives the hill farmer first class grain, rice, to last only three months of the year, and second class grain, millet, to last another three months. Tapioca, chilli, gourds and vegetables, yam and other tubers, even tobacco and illicit opium must all grow side by side on the same plot When this yield runs out, the farmer must turn to hunting and pluck his sustenance from the forest Since animals are also scarce, their husbandry is only for rituals and social transactions.

Since neighbours are strangers in a terrain of this kind, one must live in eternal terror of each other, on dangerously steep hills which command a wide view of any approaching enemy This habitatemeans climbing, often with heavy loads, up to 40 kg of firewood and precious water, which by its nature flows only at the foot of the hills And it is women

Most messages sent in Arunachal are by wireless, a constraint imposed by the terrain

carry the word of the Lord had to beat hasty retreats, or had succumbed.

What fearful forces of history impelled mankind, in the first place to seek shelter in these hills? We do not know Although some historians over that a small wave of plainspeople from the south did once cross the Lohit and settle in the plateau up north, by and large it was the Tai (or Shan) people now inhabiting three or four southern provinces of China, the Burmese uplands, Thailand, Cambodia, Laos, Vietnam,etc., who attempted in the beginning to make these hills their homes And like the Eskimos and the nomads in the deserts, their overspecialisation in attempting to conquer an inhospitable environment proved to be their nemesis. Unable to keep a store of *elan vital* for further development after succeeding in keeping a precarious foothold on a trecherous ground, for centuries they have not been able to advance beyond the tribal stage

Pine-apple flourishes in the Siang District. Below is a pine-apple farm near Along. There is as yet no canning industry to help the farmers. But the Government is planning to establish one.

cultures and languages to the far shores of their domains, and peoples inhabiting confining valleys are compelled to evolve on their own in their own restricted spheres. In Arunachal, some tribal or linguistic groups are confined to less than half a dozen villages, the people numbering not more than a few scores This diversity may be enthralling to the student of linguistics or anthropology, but how compatible are they with present-day concepts of development and social change?

Isolation, certainly, is not compatible with development, but cultural diversity? Giving a philosophy for NEFA some two decades ago Verrier Elwin had declared, and India had accepted that declaration, that it should not be anyone's intention to keep the tribal people as museum pieces. But development, he had said, should not destroy the rich cultural tapestry either.

Elwin's philosophy has been in

The pine-apple of Arunachal is very sweet and luscious. It grows in plenty but marketing the product to the plains of Assam is expensive.

An Apa Tani woman goes to work in the field with the infant cradled on her back or the hip.

who do most of the carrying Men's share of labour covers jungle clearing, hunting, fighting and parleying. Women must also till and sow the ground When childbirth approaches she simply disappears into the undergrowth for an hour and comes back with a new born baby in her arms. After suckling, cooking, firewood-and-water drawing, grain pounding and sleeping if time allows it, she also creates beauty out of dyed cotton yarn when it comes her way.

Man ages early here. We saw eight-year-olds without garments but with long, sword-like knives, the ubiquitous *daos*, dangling from their slender shoulders They can weild it against the earth, against the bamboo, against the snake, against the enemy. Man's momentous inventions like the wheel and the paddle are of no use here. Modern man who has brought the wheels can employ them only at an immense expense Isolation has also meant wayward ignorance on the one hand and close community living on the other.

A vast linguistic diversity is one surprising if inevitable result of this stagnation. While the people are uniformly Indo-Mongoloid, they are divided into, according to one Census report as many as 82 tribal groups. It is one of the accepted notions of historians that while the sea and the open grasslands act as bridges in bringing farflung communities together, hills separate them as no other barrier can. Thus, peoples exercising control over the sea or the continental plains have been enabled by travel to carry their

action in Arunachal for two decades now, and the people have travelled on the road to development to the extent that they now have a representative government of ministers responsible to an assembly. India's republican Constitution that evokes allegiance and not hostility has quite a few things to show for its strength in sustaining diversity in unity in Arunachal's special context; Painstaking and intelligent efforts at preserving the unique art, culture, myth, legend and ethos of these people even if they are drawn into the mainstream of the nation's life; the actual construction under State auspices of temples dedicated to their singular religious convictions; the detailed study of languages with the express objective of providing their native speakers with textbooks

so that their young can have the choice of learning in their own tongues according to the country's three-language formula; the assimilation of old traditions of democracy and local self-government in today's State apparatus, a dedicated band of doctors, engineers, teachers, extension workers, specialists and administrators giving the best years of their lives in the cause of change for the better. And even a Hindu religious missionary establishment cooking and serving animal protein without any prejudices in their school hostels

One often wonders what it was that gave the old ICS hands, the chosen hands of the empire builders, their ability to cope, their steady eyes and steady nerves; their refusal to cave in or crane their necks or raise their voices, their supreme confidence. And we think we got the clue in Arunachal

This Union Territory is still what the old ICS had experienced in much of India in their heydays Here an officer must be prepared not only to ride an elephant through a river to attend a bull session at Itanagar; he must also be thoroughly familiar with the fine weapons of argument and debate when he takes a plane-seat to Delhi to take on experienced adversaries in one of the central ministries or in the Planning Commission, to make them come round to his point of view Armed with the powers of a magistrate, attorney, constable and executant, a Deputy Commissioner in Arunachal must also sit on a straw mat with suit and shoes on to sip the villager's rice beer. He has to bring out with cajolery and charm the best in a village-level worker or in an engineer several years his senior in experience He has to persuade his accomplished wife to cook with firewood a formal evening meal for six or ten

Consider Miss Neeru Nanda. At thirty she is reputed to have a single-track mind: the welfare of her Monpa charges. What with an asthmatic jeep in Bomdi La pining for her mechanic's fondling hands in far-away Tezpur and refusing to budge, we were unable to make it to Tawang in the north extremity of Kameng district where Miss Nanda is Additional Deputy Commissioner. But her reputation kept following us all through Arunachal and people spoke to us of how this courageous officer of the Indian Administrative Service had instituted an informal system of fines and donations by which she collected funds to run a home for old people. Tawang,

A Lama dance before the Tawang Monastery, Kameng District

although steeped in Buddhist traditions of veneration to old people and parents, is today passing through an ugly phase of transition in property rights, and married sons with a need for privacy have taken to expelling their aged parents from their homes. It is a sensitive issue bristling with all kinds of socio-economic and religious factors and there are no ways in which the administration can take formal note of the situation and bring in remedial measures. Although we were unable to verify the facts for ourselves, travellers' tales confirmed that many expelled old people were reduced to homeless living. But a social enormity cannot wait for legislative action and Miss Nanda sought the acquiescence of her subordinates and others to fine them small amounts of money for petty lapses, so that the old people could be kept in rations at least. Miss Nanda's job as Additional Deputy Commissioner does not demand that she cope with evil on a human level; but her acquaintance with the situation screws her head a little more firmly into her heart

Or Mrs P.M. Singh, the Additional Deputy Commissioner at Pasighat. This young IAS officer of the '72 batch may find her Master's degree in geography helpful in acquiring an insight into the special problems of Arunachal, but it is hardly of any use to her when it comes to levelling her domestic life on the basis of normalcy. As mother of a six-months-old boy, a good part of her attention must be for the home Her husband is an officer in the Air Force stationed a few dozen kilometres away and the couple can spend only occasional weekends together. While the expectant journey downstream to meet with him takes three hours, the journey back, upstream, takes twice as long, and immeasureably longer in her loneliness. She is learning to cope with that, too.

A few years of weathering like this and one becomes an adept. Situations of man's making or of nature will not come down on anyone who has gone through it all plenty of times To give some personal examples from Arunachal Pradesh which came to our ken.

Or consider the cheerful doctor couple with the four-year-old identical twins, on their way to a station which is normally reached by a fortnight's footmarch We met them at Mohanbari in Assam when they were waiting for a helicopter to take them to Anini, their place of posting. Having worked for three years in a similar place, the husband knew what he, his wife and the children would be in for. Months on end on air-dropped rations which precluded fresh vegetables or meats; no prospect of an intellectually stimulating atmosphere for their children; no outside company except that provided by a dozen familiar faces; and the villagers themselves looking upon their services as a secondary aid to the shaman's mumjo-umbbo. Still, they were a cheerful couple. when the rest of the country is debating the need for barefoot doc-

The young I.A.S. officers incharge of the Districts and Sub-Divisions of Arunachal Pradesh are a dedicated lot. New to the land and the people whom they have been sent to serve, they have quickly learnt to grapple with the peculiar problems of administration and have earned respect of the local people. Above is Shri I.A. Khan, Deputy Commissioner, Lohit District standing on the sluice gate of a minidam with the Yojana party.

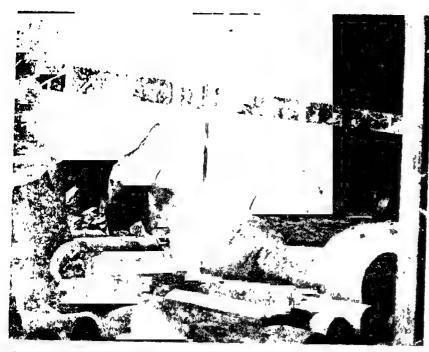
Below is Shri R.C. Rai, Deputy Commissioner, Tirap, inspecting an irrigation project at Khela, 18 km from Khonsa. Built at a cost of Rs. 45,000 in May 1974, it irrigates 182 acres. Much of the labour that went into this project was voluntary. Four more such projects have been built in the District.

tors, they had already logged several hundred kilometres in areas where only faint footpaths led out of hamlets. Dedication, these doctors told us, comes naturally to a man in these hills: When confronted with the simplicity and helplessness of fellow human beings, a man has no choice but to serve as best he can.

But simplicity and helplessness of the forest people and the remoteness of the happenings there, one old hand of Arunachal who was listening to the doctors warned us, have also worked to the detriment of the Territory in the past. There was a time when development had not acquired the edge it is acquiring today, and administrators assigned to the Territory felt cast out and saw in their situation only an opportunity to cart away ivory, to fiddle the books and replace rum bottles with broken glass in airdropping sorties entrusted to contractors, and to build houses for themselves in far away places. But today, the bystander agreed, what with the receiving end becoming a little more alert and inclined to give it back, there is more compulsion all round for the corrupt to square their consciences with the lot of their fellow citizens Vigilantism may be a horrid thing, but a little vigil goes a long way, we also agreed

However, in Lohit's dedicated Deputy Commissioner Imtiaz Khan's predicament, one can see a situation far more crucial to planned development than any petty corruption can ever be.

With 24,000 square kilometres, Lohit, along with Siang, is one of the largest districts of Arunachal. But its meagre total of 63,000 men and women makes it one of the least populated areas anywhere in the country, with a density of only three persons to the square kilometre. It has only 497 kilometres of roads. Besides, Lohit and Digaru rivers add to the problem of communications in the district, as mentioned before. But when it comes to literacy, Lohit scores with 17 39 per cent, Arunachal's highest. And it is this lead which gives Khan all his problems. And it is also indicative of the shape of things to come.

Lohit's high literacy rate is mainly on account of just one advanced community in the district, the Khamptis. Their high rate of awareness also means a higher rate of expectations. Since Lohit has a larger proportion of level ground, land developed under permanent cultivation (as against shifting "jhoom" cultivation) is the highest here amongst all the districts., as much as 820 hectares in Arunachal's total of 2,637 hectares. The Khamptis, having once experienced what tractors and minor irrigation works can produce from their fertile fields,


The Norottam Cooperative Societies have been started at Deomali, Tirap District by the Nocte Chieftains of Namsang and Borduria, surrendering their traditional property rights over forests. The share amount is contributed by 4,814 Nocte families. Each share of Rs. 250/- is loaned by the Government and will be recovered from the dividends accruing to the shareholders. About Rs. 1 crore have accumulated so far and from this People Fund has been financed two excellent Rama Krishna Mission schools run in the District. The People's Fund is administered by a Trust The Norottam Co-operative, started in 1872, has an oil-crushing, saw-milling and plywood factory.

are now clamouring for more. It is the story all over again of a development strategy working out well, the people adding to its momentum in the subsequent stages, and government agencies finding that, far from being simplistic, the problem now is to retain roused expectations in constructive channels. At Namsai, the Khampti farmers had gathered in strength on the rumour that someone from the Planning Commission was to visit their place, and we found ourselves in the midst of garlanding maidens, speechmaking leaders, a fete. Their demand: "Give us more tractors to clear this area, only machines can do it because we are far too few; give us more water and we will feed the whole of Arunachal from these very fields". Khan acknowledged that the last claim may well turn out to be true, but his dilemma was that having brought a people to the take-off stage, he had now to tell them sometimes to apply the brakes. Money for one more tractor may not be forthcoming. And the demand of the Khamptis finds an echo in the Territory's annual plan document, too:

"In the past, lower allocations for Arunachal Pradesh were dictated through the difficulties of usefully spending more money or developing resources more rapidly due to the basic lack of infrastructure or other reasons.... Now, a full zone under a Chief Engineer has been created and the strengthening of the CPWD sanctioned. Similarly, some much needed strengthening of the other departments now seem realistically possible....Out of the Territory's total Fifth Plan allocation of Rs 633 million, Rs 241 million have already been spent, leaving only Rs 392 million for the remaining two years.. Apart from this, there are extremely cogent and urgent reasons why the Fifth Five Year Plan should receive drastically higher outlay than has been provided hitherto..... From 15 August, 1975, a full-fledged legislature has been introduced in the Union Territory. The aspirations of the people have been roused.... and it is essential to match these with outlays... The 20-Point Programme.... ", and so forth.

Clearly, just one rung of the development ladder leads things to the national vortex of expectations and contending priorities. So much has to be done. The people are willing and eager. But our wherewithal is limited and it has to be apportioned evenly.

While making out as strong a case as possible for getting a larger share of the national cake, the people of Arunachal have proved their mettle in giving, too. The chieftains of Namsang and Borduria in Tirap have surrendered their ancient traditional rights over forests and have created a People's Fund which now approaches Rs 30 million, a largesse for the common weal unheard of in any other part of India. Out of this fund have come more than Rs 2.5 million for two Ramakrishna Mission public schools and Rs 1 million as loan for 4,000 villagers at

Rs 250 a family to acquire shares in a cooperative for wood-based industries. S.C. Sharma, the Deputy Commissioner of Siang, said that it was possible in his district to construct one kilometre of mountain road 16 ft wide for as little as Rs 10,000 when the actual cost could be Rs 100,000, because the people give their labour free. Government agencies come in at such road-building projects only with technical advice and supervision, hard rock cutting and bridge-building beyond the 30-ft span. Shramdam are part of other building projects, too. The *Dolung Kebangs* (village councils) of the Adis decide that everyone should contribute his labour When the message goes out, even senior government officials serving in far-off places have to take leave, go to their villages and help out with the job at hand. No one is exempt. In this ancient system of *Kebangs* wherein elements of a criminal procedure code are well-established and fines up to Rs 100,000 could be imposed on a sentenced individual, that individual is held in adherence by his family, his clan, his tribe. He just has to obey.

We saw evidence of this spirit of giving on the highways, too: mystifying bamboo bar gates with dwellings attached to them every few kilometres. On enquiry it turned out that the gates were meant for protecting the crops from free-roaming cattle A field on level ground is a precious thing in Siang and among some communities. entire villages gather for communal rituals and dancing when a fence is put up around a field. When a road passes through a cultivated area the practice is to put up gates where the fields begin and end. Earlier, when the gates were unguarded, every vehicle was expected to stop for the opening and the closing of it. When a truck or bus driver neglected to close a gate behind him, the villagers would chase him to the town, and there would be fisticuffs. When this ritual began to get on everyone's nerves, the authorities told the *Kebangs* that roads cannot serve fast movement if vehicles had to stop eternally for opening and closing of gates And a human life could well depend on fast travel. That convinced them and now every gate is guarded by a watchman whose duty it is to keep it open for traffic and closed for cattle. The *Kebang* builds his dwelling and pays his salary.

A dormitory in the Rama Krishna Mission Boys School, Deomali, started in 1972. Swami Gambhirananda is the executive head of this school with 284 students, all of whom are tribals. All the boys are boarders and their accommodation and food are free. The Ramakrishna Mission Schools at Deomali and Along can be reckoned among the best institutions of their kind in this country. *Below* : The prayer time. All religions are sacred.

Willingness to give comes naturally to the highlander, who cannot survive in his hostile environment without sharing and cooperating When a man's home needs heavy repairs which he cannot accomplish by his own labours, he can count on the entire village pitching in. When a man dies, often it becomes the duty of his brother to take his sister-in-law for a wife and care far her and for his brother's children. If the widow prefers to remain alone, the entire village will help her with jungle-clearing and tilling.

A chief may be wealthy with a number of Mithuns to show for it, but when they are sacrificed in a ritual, it is the entire community

will let you. But if a price is mentioned don't try to bargain; a man's utterance is sacrosanct. A word, be it a price, is not given lightly. One shocking incident we heard about concerned an Arunachali maiden who had taken a *dao* and cut off her thumb to prove herself truthful in a *Kebang* assembled to determine whether a certain young swain from the plains had actually promised to marry her.

The people of Arunachal Pradesh do not object to the plainsman or anyone else from wooing their daughters and marrying them. Indeed, a female Monpa face is a piece of translucent porcelain and no male heart can resist its delicate nuances of seduction and doe-eyed innocence washed in brown and pink. But what is of concern to Arunachal society is that their girls can easily be led up the garden path and abandoned. Education and the descent of 'modernity' are also throwing spanners into the traditional works of Arunachal society, (discussed elsewhere in the section on education). At the time when public schools came up for tribal boys someone objected that the boys will not any more marry their own girls. To which Lieutenant-Governor Raja replied with a large public school exclusively for girls. But in sturdy Khampti society, a woman's worth is still measured in terms of her ability to do all the household work, including the weaving of all the family's clothing But what about a man's worth, I asked Chowkhamoon Gohain Namsoom, their doyen and former Member of parliament. A man, he said, has to prove his worth before asking for a wife in all the manly arts farming, trading, industry, house building and learning. And war.

That ancient horsetrading, the bride-price, operates in many communities. The price is five or six mithuns, each costing Rs 1,500. Mithun is valued because it is rare and its meat is eaten only on festive or ritual occasions. Homes display rows of mithun horn salvaged from sacrificial occasions. A woman is valued because in spite of being fragile and comely (we did not come across any other variety), she is capable of hard toil. Woman far outnumber men in many communities, a fact, as we were assured, not found reflected in aggregate census figures because of the presence of working male population from outside. In any case, polygamy is not uncommon and chief may have half-a-dozen or more wives with separate compartments for each wife in house which may run as long as 250 ft in its length if it is a large joint family consisting of man, wives and married sons. But trading a daughter for half-a-dozen mithuns is not such a profitable proposition as it would seem in this equity-loving part of our country. Th bride's father has to give her heav loads of beads. The mithun he ge in compensation merely roams tł forest and does not do any usefı work or give milk. Eventually it eaten by the whole communit Also, while it is living, it has to l given salt to lick from the owner hand every day to keep it tame.

The Yojana Party experienced the unforgettable warmth and hospitality of the village folk when they visited BELO village. Cheery Apong flowed freely and several chickens were butchered to serve the guests.

Above : **The leader of the Yojana Party was honoured with the presentation of the traditional embroidered coat.**

Below : **The local leader, also reputed to be an orator, made a long speech representing the local people's problems and praised the authorities for the achievements made.**

But the simple fact of the matter is that despite all differences man's predicament in Arunachal is not a matter of fundamental differences at all. Their share of social burdens or superstition is not in any way more, or less, debilitating than that of a don in a university. If dons blame them for not climbing down to easier ground, it is as well to remember that the English word *idiot* is derived from a fifth century BC Greek word which originally meant anyone who refused to climb down from his ivory tower

The skill needed to drive a car through a busy thoroughfare is in no way superior to the skill, and courage, needed to negotiate a jungle path on a dark night If a physician can look at an electro-cardiogram and give his patient a prescription in order to earn his bread so can a tribal wanderer in the forest size up the seedlings growing at the foot of a tree, estimate the size of hornbill chicks high above him in the nest, and shin up the tree to earn his dinner. At Rani village near Pasighat we watched an old man working on some strips of bamboo with a hooked penknife. His fingers, teeth, toes and body came into a facile orchestration of movements as he twisted and knotted the strips of pliable bamboo. Finally, his object emerged, a cunning little bird trap shaped like a bow. The old man's concentration was no different from that of a TV mechanic operating in a city drawing room.

The total complexity of any two given languages, experts now agree, are about the same and there is no need for a native speaker, of say, Malayalam, to feel superior to the Sherdukpen. The so-called superior vocabulary of any modern language consists entirely of borrowed feathers

Life is long
And our song is short
Nevertheless,
With our short song
May we wish you long life?
We wish you welcome
Into our midst
May you come again.
You come from afar
With our hearts and our song
We welcome you
You have travelled far
With travail
May our song relieve you
Of all the tedium.
Once we,
The Nepak, the Nemae and the Nishi,
Were one
But now we live in different parts
But we are the same; one
Nepak and Nemae practise writing;
We the Nishi do not write
But we are one,
Come into our midst,
We are all one

Indeed, man the thinker and the worker is the same everywhere, with the same brain and pair of hands, appetites and proclivities. But how did he get differentiated into tribal and citizen? Into nomad, farmer, industrialist and businessman? Arnold J. Toynbee in his *A Study of History* examines the various factors such as the stimulus of Hard Countries, the stimulus of New Ground, the stimulus of Blows, the stimulus of Pressures and the stimulus of Penalizations, all of which may lead to the growth of civilizations and arrives at this conclusion:

> The most stimulating challenge is one of mean degree between an excess of severity and a deficiency of it, since a deficient challenge may fail to stimulate the challenged party at all while an excessive challenge may break his spirit. But what about the challenge with which he is just capable of coping? On a short view this is the most stimulating challenge imaginable; and in the concrete instances of the Polynesians and the Eskimos and the Nomads and the Osmanlis and the Spartans, we have observed that such challenges are apt to evoke *tours de force*. We have also observed, however, that in the next chapter of the story

A Ponung, welcome song, of the Adis, sung to welcome the *Yojana* party at the Belo village of the Gallong people near Daporijo in Subansiri district. The song was translated for the author's benefit by Shri Tayom Bage, 18, studying in Class X in the Daporijo Government Higher Secondary School.

these *tours de force* exact, from those who have performed them, a fatal penalty in the shape of an arrest in their development. Therefore, on the longer view, we must pronounce that the evocation of the greatest immediate response is not the ultimate test of whether any given challenge is the optimum from the standpoint of evoking the greatest response on the whole and in the end. The real optimum challenge is one which not only stimulates the challenged party to achieve a single successful response but also stimulates him to acquire momentum that carries him a step further: from achievement to fresh struggle, from the solution of one problem

This photograph of a Mishmi home was taken after night-fall. The girl climbing the ladder had just returned with the bamboo water containers from the nearby jungle. Women go alone to the jungle streams to collect water even during night time with a bare hurricane lantern in their hand.

to the presentation of another, from Yin to Yang again. The single finite movement from a disturbance to a restoration of equilibrium is not enough if genesis is to be followed by growth. And, to convert the movement into a repetitive, recurrent rhythm, there must be an *elan vital* (to use Bergson's term) which carries the challenged party through equilibrium into an overbalance which exposes him to a fresh challenge and thereby inspires him to make a fresh response in the form of a further equilibrium ending in a further overbalance, and so on in a progression which is potentially infinite. *

Can we artificially or with the aid of outside agents create this *elan*?

A review of what has already taken place in the past two decades indicates that compared with its totally unadministered state with no infrastructure whatsoever a quarter of a century ago, Arunachal today is the one place on the earth where the maximum possible change has taken place in such a short span of time. Its people are leaping the centuries into modernity, and the hills which once defied five imperial dynasties are now echoing with the drone of hydel plants planted in their secret crannies by engineers serving a republic.

Believe it or not, full one half of India's total power otential is in Arunachal Pradesh, according to an estimate made by the former Central Water and Power Commission some ten years ago. The first hesitant step to tap this immense wealth was taken in 1972 in Kalektang in Kameng with a 10 kW station. The cost of production would be 10 paise per unit, compared with 50 to 60 paise per unit in nearby Assam. By March 1977 Arunachal hopes to plant its first megawatt milestone at Ziro. Arunachal can use only 0.5 megawatts, and the rest would be sold to Assam at 20 paise a unit, fetching the Territory an annual revenue of Rs 1.3 million.

When the subsequent megawatt milestones are planted, Arunachal will become India's richest State.

There are insurmountable engineering problems in making this possible. The bulk of the potential exists in Kameng and Subansiri. The rivers are small and much of the potential can be tapped by simple penstocks without recourse to expensive or dangerous damming in the unstable Himalayan terrain. The main problem would be one of creating extensive grids, but that too is not beyond our present ken.

Facing Page :
Sowing on a terraced field. Terrace cultivation is finding acceptance increasingly with the tribal farmers.

---

*Arnold J. Toynbee : *A Study of History:* Volume III The Growths of Civilizations. Oxford University Press, New York and London.

Apart from hydel power waiting to e tapped, Arunachal has forests nd minerals too, strengthening its iaterial base, (see separate articles n these two topics). But when all said and done, to the people them-·lves right now, the prospect is one f continuing struggle; since food ›ntinues to be their fundamental eed in life, efforts to increase its ipply should be development's rst aim, if they are to be released om the cruel clutches of the hills nd the task is not easy.

Land, Food And Livestock

The great transition from shift-ig cultivation to settled cultiva-›n has begun in Arunachal only a small way. And until this ›vement has attained some mo-›ntum, very little can be said about : people themselves undertaking :ir own development In scienti- terrace-building, the humous-h topsoil is scrapped first and kept de. The hillside is then divided o convenient strips and the earth m the higher portion of each strip lug and brought to the lower por-n, thereby forming a level ledge. e scraped topsoil is then care-ly spread on top At the Senua l conservation training *cum* de-nstration centre in Tirap, orga-ed effort to disseminate this hnology was begun in earnest y in 1974. This farm has now ıe 150 acres under wheat Batches village-level workers go there for iods of five months at a time to n the technicalities They are ı expected to return to their com-ıities and begin the work at ›sroot levels Admittedly, it is ıg to be a slow process. In areas re the gradients permit it and re population pressures give an ed incentive, the different com-ıities do take to terrace-making. ı Lohit where substantial level ınd is available, attempts are made to settle the Mishmis in pact villages. One important 'tional reason for settling farm-communities close to the dis-'s capital at Tezu is that any lus grain that they might pro-: will to that extent reduce Tezu's ›ndence on outside supplies, ı communications are so diffi- there for the major part of the . In fact, the authorities per-e the Mishmis to cultivate ıt as a second crop for the

A house under construction in Tafrogam

winter, and sell their entire produce. (The Mishmis do not eat wheat).

The regrouping of scattered families into compact villages makes it easier for the administration to reach them with health care, education, water and state aid. At Tafrogam, four kilometres outside Tezu, some 1,000 acres of land are already cleared and given to 100 Mishmi families, formerly scattered in half a dozen settlements. They are also given Rs 200 as subsidy for seed, implements, etc, but not for house-construction. Initially, they were persuaded to put small shelters in the fields themselves, but now that they have seen the benefits of community living, they are putting up larger dwellings. The settlement had involved the clearing of thick jungles in which trees, many of them giants, were found at the rate of 1,000 to the acre. Tafrogam is already in its third year now. In the next stage, to be completed in a couple of years, there would be channelled water and more tractors for preparing the ground. Double cropping and animal husbandry would also be taken up. Already Tafrogam has a lower primary school, piped water and a few government tractors to be had on hire. A senior village level worker, Shri G.C. Sonowal, and an agricultural inspector, Shri S.R. Patel, are the two crucial agents of change on whose labours and sincerity the whole project depends for its viability and success.

Based on the experience at Tafrogam, another 750 acres are now additionally developed at Loiliang close by for the benefit of additional 75 families. Loiliang also has a middle school and a dairy farm. The two settlements are to be connected by a road soon.

But it has to be recognised that scope for such settlements are very rare in Arunachal. The other important matter to be borne in mind is that the land will not yield a surplus if primary grain alone is to be raised from it. True, the high cost (and occasionally near-impossibility), of transporting grain from the plains to the hills makes it imperative that the hillsman raise his own grain; but his dependence on land has to be diversified to include low-volume-high-value crops as well as livestock. But here again, the vicious circle can be broken only by overcoming the communications hurdle. Of what use can cash-crops be if they cannot be exchanged for cash? Oranges, pineapple, banana, apple, lemon grass, ginger, tea and sugarcane—the different regions of Arunachal Pradesh can and do grow them in varying degrees of abundance. But the administration is now forced to limit their large scale extension to only a few accessible areas where some kind of rudimentary marketing facility exists. With the help of Himachal Pradesh, whose Chief Minister Dr. Parmar had recently visited the Territory, Arunachal is now guardedly committing herself to taking firmer steps to extending apple cultivation, pinning her hopes on more roads. Similarly with tea and silkworm rearing.

Facing page : **In Lohit where some level ground is available the Mishmis are being settled in compact villages.**

In the matter of livestock, things are a little more difficult, despite the efforts under way now. The task of stabilising profitable breeds to suit the terrain and clime is yet to be undertaken and it may be years before it is successfully accomplished. On the face of it, it is the goat which can easily and most economically convert the abundant vegetation into valuable end products useful to man. But agricultural experts and economists are yet to overcome their dread of this hardy but destructive creature and everyone in Arunachal trots out the case of a east European country where the goat is now banned by a state edict. The cold fact of the matter is that an ecology can be transformed or destroyed by *any* creature, if given the chance. There are two goat farms in the Kameng district but elsewhere the animals are treated with indifference. The problem generally with livestock rearing is that superior animals need superior feed and care; in the absence of it, artificial insemination, etc. can only degenerate into a mongerel breeding programme. Thus, the introduction of sophisticated animal management techniques may have to await the arrival of sophistication at other subsidiary levels.

Raja and Road Building

And whether we call it sophistication or development or whatever, it is roads alone that can bring it to the hills. Whether it is meat or fruit or spice, it is not so much their production that is the problem but their transportation. The economic symbiosis of disparate geographic units becomes complete when communication brings about easier intercourse. Inscribed on a marble column in Khonsa, we saw a poetic expression of this basic economic fact:

We cut these roads
That from the meeting of the ways
New vistas might lie
open to our progeny.
Remember us. Think well.
We do not ask your praise,
Only the faith to pass
The crossroads of your destiny.

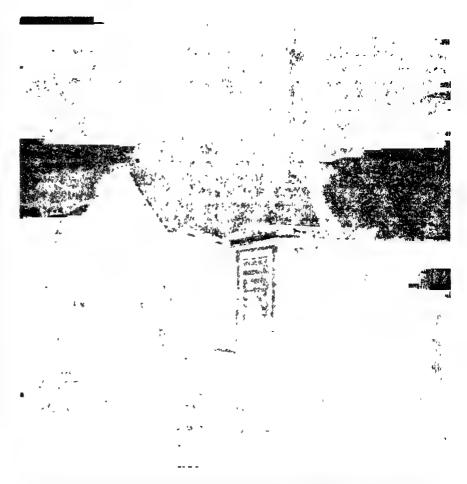
Thus inscribed K.A. Ayyaswamy Raja, IFAS, Political Officer, Tirap Frontier Division, on that column in Khonsa, when under his leadership Noctes, Wanchos, Tangsas and Singhpos of the region had completed 180 miles of mountain roads on 28 February 1959. Shri Raja today is the Lieutenant-Governor of the whole Territory and instead of just four tribes, he has the entire population of the region harnessed to the task of attacking the innermost core of their isolation and backwardness with more and more of roads.

At his temporary head quarters in Itanagar, Shri Raja refused to take the bait we had offered him to talk about his own life's work, dismissing the prodigious feats of opening up the land, feats which had earned him the name "Raja the Roadbuilder", as something ordained by a Higher Being in his own inscrutable scheme of things. But his subordinates elsewhere were less reticent. They told us how this wealthy landowner from Rajapalayam, once the Commandant of the 1st Parachute Battalion of the Kumaon Regiment, and later o[f] paramilitary resistance forces of th[e] frontiers spends the *Brahma Muhurtam*, the sacred hours of the nigh[t] after the midnight hour, awake an[d] alone in prayer, seeking the Ligh[t] that would show him the way; how he knows every turn in ever[y] mountain road in Arunachal because he himself had built man[y] of them; how he calls everyone who was anyone in Arunachal by the[ir] first names because he had know[n] them all as kids; how providenc[e] itself seemed to intervene in hi[s] behalf when everyone assumed h[e] had at last overreached himsel[f] with some bold decision or other

Amount the crucial agents of change is the introduction of new crops like orange, pineapple, spota, lemon etc. Here is a flourishing orange garden owned by a tribal.

how he had planned and built Khonsa, operating from bamboo shacks and was promoted and sent away when the time came for its occupation; how he had built the temporary capital and its approach road in just one year's time and then moved on to build the permanent capital. Shri Raja has spent the major part of his working life in the hills and the major part of his energies were spent in breaching and impregnating them. For a while he was Development Commissioner of Ladakh, and there, true to type, he went to work on the hills once again and opened the first road between Kargil and Leh.

Imagine a traveller either in Orissa or Kerala every time going to the adjacent State in order to journey from one District HQ to another District HQ. Unimaginable? But that is what one has to do now in Arunachal in order to journey from one District HQ to another! There are no lateral roads in the Territory connecting the different district towns except the one between Ziro in Subansiri and Along in Siang. Everywhere else one has to journey up north from the plains of Assam, come down south, and climb up once again in order to enter second district. Thus, in our tour we had to pass through all the important towns in northern Assam such as Tezpur, Dibrugarh, Tinsukia, Nahrkatiya, etc. Public transport exists only on one or two routes. Officials on tours without their own jeeps have to beg lifts from anyone going their way. At Along, we met a labour inspector waiting for a cabin seat in a truck and he was waiting for it for the past three days. At a wayside shop a few kilometeres outside Along we got 20 of the world's sweetest and fattest bananas for a rupee because the woman who sold them to us had no other way of disposing them of. We could see here that a road is truly man's salvation in the hills.

But, even when given this paramount need. Shri Raja's all-out attack on isolation with road consruction is not without its detractors. Many newly made roads, his critics point out, have fallen into decay. His engineers also agree that they could be kept in better shape, if funds were forth coming. But the fact of the matter is that wheher one develops the people to such an extent that they go and build their own roads or whether one develops the roads so that the wherewithal of further development comes to them, one has to break the vicious circle somewhere


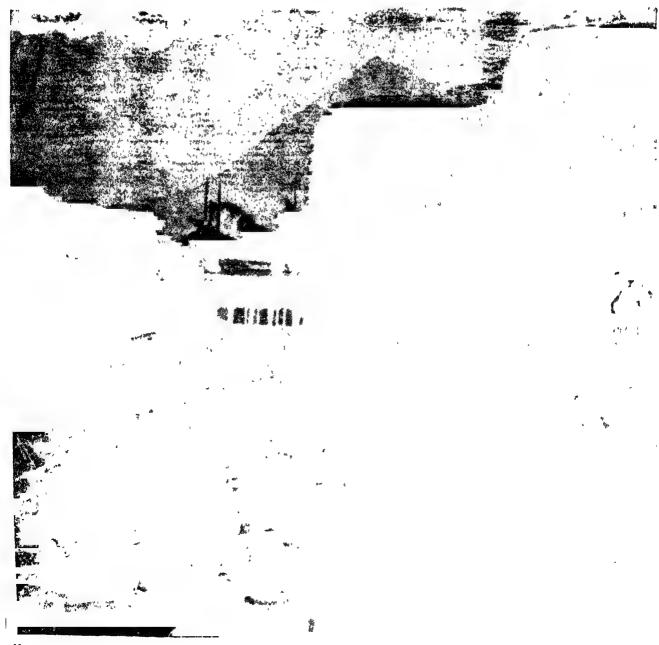
All new development in Arunachal like introduction of horticulture, fruit culture, sheep and cattle farming hinges on roads and communication. The tablet above commemorates the voluntary contribution of tribal labour for building new roads.

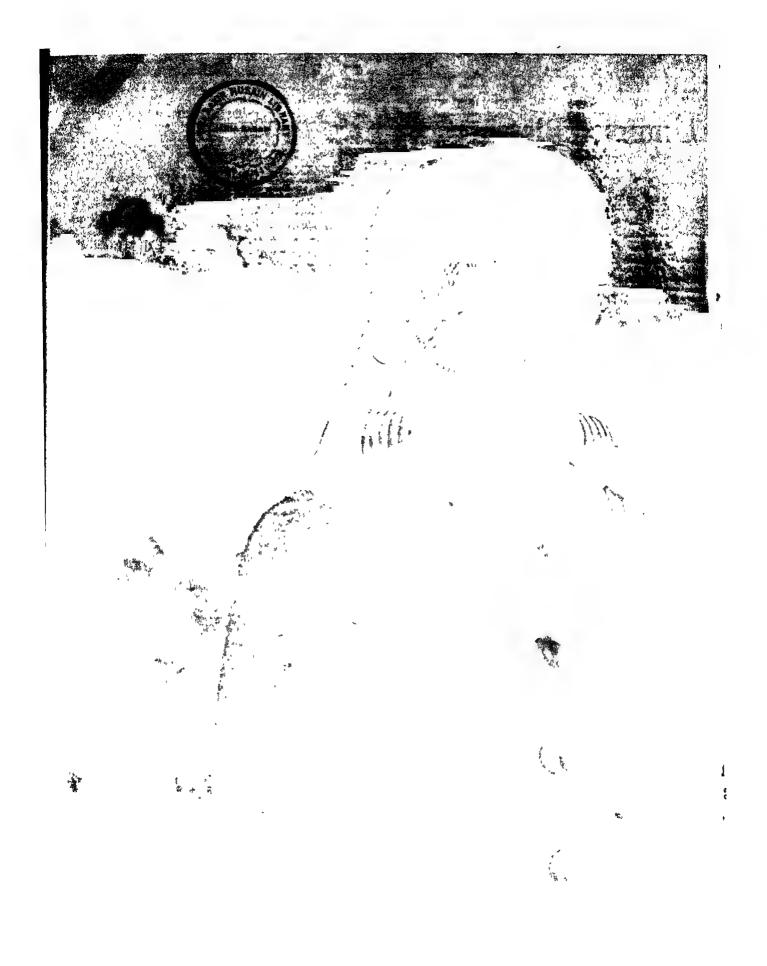
A disturbing corollary that emerges from this observation is that there is the possibility of erasure and obliteration when the development of virgin ground is akin to writing on a clean slate Given the legacy of backwardness in agriculture, health, education and everything else, one is free to start anywhere, and compelled to start everywhere. But the rational method would be to try and identify a single strand that runs through it all, give it the supreme priority, and go to work simultaneously on other sectors as well.

But when backwardness is so

general, the distinction between priorities and generalities tends to get diffused. To go back to our analogy of the slate, the trick is to etch the basic design in a deep grove, so that subsequent hands do not smudge or obliterate it. But this cannot always be ensured because the stylus to accomplish it, financial resource, is so uncertain. All social infra-structure building requires not only heavy initial capital expenditure, but subsequent maintenance expenditure too at the rate of about 30 per cent of the initial cost. Thus, any progressive expansion would immediately lead to a much larger aggregate cost. Unless Arunachal too takes into account this basic lesson India has learned from its overall development experience, her pot of grapejuice too (to change the metaphor) may turn into vinegar instead of wine. But some yeast may be forthcoming from internal resources such as power generation, as we had indicated earlier. As it is, the annual descent of frost in the shape of cuts in funds is going to wither many a bloom before fruiting.

Perhaps the other disquieting aspect of development in Arunachal lies in the education system. Here too there is every possble complusion from every possible quarter to expand the facilities, the way it has happened in the plains, and the facilities wife expanding. But there is no immediate hope of turning all

Above : A Mithun, the most prized personal possession of many Arunachal communities. *Below:* A view of a typical Nocte village built on the rocky heights of a hill built about 200 metres above the road level. The problem of water and sanitation is acute in such villages. facing page: A Mishani women with child




Education Not An Unmixed Blessing

educated manpower into productive manpower. This is the crux of the problem. Indeed, some disenchanted observers of the educational scene in Arunachal feel that this particular leaping of the centuries may well land Arunachal society in some sort of unrest. The problem is the familiar one of improper human engineering and inept pairing of arithmetically expanding material resources with geometrically expanding human aspirations. Newly introduced formal education makes the youth unfit for traditional occupations and lifestyles. On discovering that his certificate is not such a promising meal ticket after all, the youth turns into that familiar avenue of social frustration we are so fond of euphemistically calling politics' Arunachal can escape the general fate only if its human enneering is perfect. To look at the problem squarely and factually in the face;

Tribal students have taken earnestly to the study of science and in some schools laboratory equipment is not adequate.

Except for the Monpas of Kameng and the Khamtis of Lohit, both of whom are Buddhists with traditions of learning the scriptures in archaic languages from monks, there are no traditions of formal education among the tribal people of Arunachal In the past decade and a half, schools have multiplied so fast that learning now is within the reach of almost all. If a school is not within walking distance, the pupil can claim boarding facility wherever they exist.

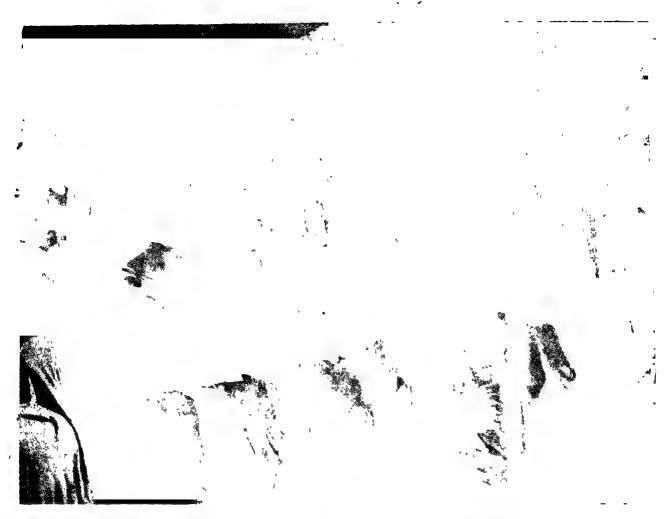
It is quite conceivable that the education a boy or girl receives can give him or her marketable economic skills, but these markets for skills are yet to arrive in Arunachal For the few who go up the competitive ladder the only economic opportunity available at present is a government job, including a soldier's job. Although migration to the plains is not yet happening now, there is already the phenomenon of stipend earners loitering in the towns during vacations instead of going home. The educated mind's dissatisfaction with village home conditions is at its worst in tribal societies. Making the educated Arunachal return productively to his village is not going to be easy. Economic opportunities created by development of horticulture and horticulture-based industries, animal husbandry, poultry farming, and the development of local crafts based on local resources may act as draw magnets, but their development again is dependent on a lot of ifs and buts.

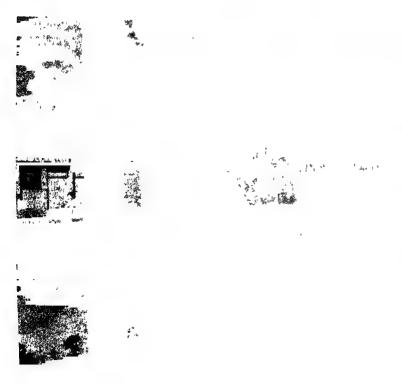
What is perhaps equally important is to introduce the Habitat concept into Arunachal before it is too late, so that villages become livable for the educated and cultivated human being. Arunachal homes made of bamboo, timber and thatch have evolved through the centuries using local materials to

While the compulsion to expand education facilities continues, the philosophy underlying the system is to grapple with the need to match thirst for knowledge with betterment of life. The problem is not merely one of possible employment of the educated, it is a problem of improving the habitat with the help of educated youngmen and women.

Students at work at Pasighat college

suit the local climatic conditions. But they were never meant for piped water, electricity or even simple furniture. In the evening when half a dozen hearths in a home starts spewing their smoke, a man can keep his head from reeling only if he continuously assumes the sqatting posture. On his feet, his head is in a cloud of smoke. A schoolboy returning from a well-lit, well-ventilated hostel finds his home intolerable. Clean linen, good food, tables and chairs, crockery and cutlery, toilet and bath facilities, all made available free to him in the hostel are not obtainable at home

At the Jawaharlal Nehru College at Pasighat, Arunachal's only college for the time being, the hiatus is sought to be closed by making college education project-oriented. But the fact remains that young people who go on to the college level are only a fraction of school-goers. The aim of the project-method is to make science subjects like physics, chemistry, biology, etc, of practical value to the student by objectifying


The Jawaharlal Nehru College at Pasighat, the only one of its kind in Arunachal, is trying to bridge the gap between education and employment. Ably managed, it seeks to provide facilities for sports, social service and disciplined living.


the principles involved and linking theoretical learning with practical life and productivity.

At Pasighat we met a group of schoolboys who had walked 11 kilometres to see a science exhibition. At our exchanges, it was difficult to determine who was interviewing whom, so tremendous was their curiosity and thirst for knowledge of the outside world. They all wanted to become teachers, doctors, scientists, When denied that chance at the end of their hopeful careers, will they all want to become MLAs and ministers?

The Pasighat College has a mission to perform: To make the hillman and hillwoman fitter for the hills. It is a mission that has got to succeed.

This will call for special efforts to tailor education to the needs of the tribal people. The practical classes in the laboratories have to make up for the deficiency of the lectures and tutorials since it is here that students handle materials and problems that can be of use to them in life. In the

Preserving Tribal Dress

I am horrified at the picture of these people being made to give up their old artistic-clothes or even lack of clothes in favour of a dirty pair of shorts or some such thing. I am also greatly disturbed at certain shabby articles of modern civilization replacing the artistic products of these people. I am quite clear that we should prevent cheap mill-cloth going there as far as we can. we are in fact encouraging hand-spun and hand-woven goods all over India. Surely we should use only these in this area for presents and for other purposes. Indeed the rght course woud be to get yarn woven into artistic patterns and encourage this artistic craft there.

I do not agree with the criticism that the preservation of tribal art and tribal dress indicates a desire to keep the tribal people as museum specimens. The danger is that these people will lose their culture and have nothing to replace it. I have no doubt that with the opening out of roads and other communcations, these remote areas will be influenced by the rest of India. What has usually happened is that these artistic primitive people lose their artistry and get nothing to replace it Of course I do not wish them to feel that we are stopping the 'clock of progress, though I have my grave doubts as to whether this clock is one of progress or not. We do not wish to stop them from doing what they like, but we must not encourage them to go the wrong way."

JAWAHARLAL NEHRU

Geology and Mineral Wealth of Arunachal Pradesh

A Challenge to the Explorer

DR. S.N. SEN

Arunachal is perhaps the most challenging part of india Much of this challenge comes from the nature of its terrain. There are three distinct physiographic units of Arunachal Pradesh--the sub-Himalayan, the lower Himalayan and the greater Himalayan. Unlike the western Himalayas, this territory presents many hazards, mainly in communication Besides, historically speaking the region has suffered neglect for centuries and the beginnings of geological exploration are traceable only to the l forties. Now, however, systematic explorati has been taken up and we are far from havi completed this task. Many valuable mine deposits have been traced in this territory a the scope for detailed survey is enormo But modern communication and technolo have already made a deep dent into the isol tion from which Arunachal has suffered f centuries and the future has great promi

THAT SECTOR OF the Eastern Himalaya which formerly formed the Assam Himalayas with different segments, of Aka, Dafla, Miri Abor and Mishmi Hills, subsequently became known as the NEFA Himalaya. It now covers the major part of Arunachal Pradesh which came into being as a separate Union Territory of India on 19 January, 1972. The name Arunachal has been quite appropriately chosen since this is the first Indian soil to greet the rising sun. Of its five districts, four viz., the Kameng, Subansiri, Siang and Lohit districts geographically represent the easterly extension of the Himalaya beyond Bhutan; its fifth district viz., the Tirap district towards the southeast covers the easternmost segment of the Naga-Patkai range abutting the Lohit front

Out of the total area of the territory, covering 81,426 sq. km. the Himalayan part covers about 79,000 sq. km. The territory has a total population of about 4.5 lakhs with a literacy range of about 10 per cent.

Dr. Sen is Deputy Director General, NER, GSI. G.S.I. celebrated the 125th anniversary in 1976.

Lying within the tropical monsoonic belt the Arunachal Himalaya makes a favourable habitat for a variety of flora and fauna,—including a few rare species, the systematic study of which is yet to be organised.

Physiographically, the Arunachal Himalayas constitute three distinct units.

(i) The sub Himalayan belt comprising the frontal hill ranges fringing the northern limit of the Brahmaputra valley of Assam. The hills vary in altitude, rising upto 1700 m (m s l)

(ii) The lower Himalayan ranges, upto 3500 m (m s.l) in altitude

(iii) The greater Himalaya with important peaks like Gorichen (6538 m) and Kongtu (7090 m)

Eastward from Bhutan, the Arunachal Himalaya extends E-W to NE-SW through the districts of Kameng, Subansiri and Siang. Beyond the Siang gorge it takes an oorgraphic swerve to the southeast in the Lohit and the eastern end of the Tirap Dist, forming the so-called Eastern Himalayan syntoxis. In the Lohit Dist. the sub-Himalayan belt is insignificant, the Lower Himalaya, represented by the Dap Bum Range is upto 3800 m (m.s. and the greater Himalaya excee 9500 m (m.s.l.) in altitude.

Geological Work

Unlike the Western Himala the Arunachal Himalaya prese many hazards in mobility and int communication because of thi forests, extremely rugged terr and very limited land routes. these still hinder effective surv works in the territory. In fact, a v area of the territory is remain *terra-incognita* in so far as o knowledge of the geology and mi ral occurrences of the terrain concerned.

The earliest geological inves gation in the territory was in 18 when Wilcox made some observ tions in Lohit district. Subseque geological observations in the oth parts of the territory came throu a few punitive expeditions and

Facing Page.

plorations carried out by Rowlatte (1875), Godwin Auten (1875), La Touche (1883), Maclaren (1904), Goggin Brown (1912) and Pascoe (1911). Similar occasional exploratory works continued till the forties and these bring into light the existence of various groups of rocks ranging in age from Pre-Cambrian to recent times described in detail in the foregoing chapter on geology.

From the late forties to the early sixties several traverses in different parts of the territory were made by A. K. Dey and G. C. Chatterjee (1949), T. Banerjee (1950-52), Balasundaram (1956) and Laskar (1953).

Since the inception of the Geological Survey of India's Assam Circle with its Office at Shillong in 1961 and later, of the Arunachal Pradesh Circle office located at Tezpur in 1969, a systematic mapping of the territory has been done. A number of exploratory traverses were carried out in this connection. The Somnath (Goichen) expedition programmed in 1962 had to be abandoned due to Chinese invasion. In recent years, two major expeditions viz the Dapha Bum Expedition 1969-70 and Subansiri Expedition in 1974-75 have been successfully carried out. All these investigations and expeditions have led to the discovery of occurrences of nickel-cobalt bearing sulphide, iron ore, limestone, dolomite marble, graphite, peat and coal in different parts of the territory.

Geology

In Arunachal Pradesh, geological mapping carried out by the Geological Survey of India in different districts covers a total area of about 7500 sq km The geological information gathered so far has led to the deciphering of various geological aspects—structural, tectonic and geomorphic in broad patterns and has helped to some extent in establishing the mineral potentialities of the territory

The general geological set up of the territory begins with the crystalline rocks of the Higher Himalayas. This group of rocks is the oldest, belonging to the Pre-Cambrian age (3600 million years old) occupying the northern part of the territories covered by the Kameng and Siang districts The rock group, stratigraphically referred as the Sela Group, consists of metamorphites, mainly the high grade schists, migmatites, gneisses and granites.

The next younger group of rocks in the stratigraphic sequence is the Bomdila Group comprising mainly chlorite quartz schists, sericite quartzites, mica schists and amphibolites. These rocks range in age between 600 to 3000 million years. The schists occasionally enclose bands of marble as seen in parts of the Kameng district, and graphites as seen in parts of Subansiri district. This group is represented in the Lohit district by gneisses schists and graphitic schists

Rock similar to the Bomdila Group in Arunachal are also noticed in Bhutan and Sikkim.

The next younger group has been classified as the Bishom Group ranging in age from 600 to 300 million years. This group consists of three different lithological units named as the Tenga, Miri and Bichom Formations The Tenga Formation includes a suite of phyllites, quartizites and schists with occasional bands of dolomitic and carbonaceous slates in Kameng, Siang and Subansiri districts. In the Lohit district this rock unit is represented by limestone, marble, quartzites and serpentinites. The Miri Formation consists of variegated slates with calcareous beds and quartzites associated with volcanics (Abor volcanics-basalts and andesites) These rocks are well exposed in the Subansiri and Siang districts and in the Dihang Valley of the Lohit district. In Lohit district the diorites and granodiorites form a part of this formation. The Bichom Formation consists of marine shales, calcareous shales, boulder slates and quartzites, well exposed in the Kameng, Subansiri and Siang districts. Rock types equivalent to Bichom Formation are not found in the Lohit district.

The next younger rock unit overlying the Bichom Group, is the Gondwana Group (300-150 million years) consisting of black shales with calcareous and cherty nodule and bands of slaty shales including invertebrate fossils and quartzites, sandstone, black sandy shales and silts more or less carbonaceous with occasional thin, highly crushed coal seams Plant fossils typical to the Gondwana rocks elsewhere in India are also found in these rocks. The Gondwanas extend as a narrow belt of internally folded rocks along the southern front of the Kameng, Subansiri and Siang districts. They are not found in the Lohit district.

Basic traps associated with quartzites are seen overlying the Bichom Group in the Siang district. These rocks are presumably of Mesozoic age (225 million years) and considered equivalent to the Sylhet Traps of Meghalaya.

The next younger rock suite comprise the Tertiary Group (70 to 10 million years) covering the northern foot hills of the Kameng, Subansiri and Siang districts and the Western foot hills of Lohit district. The Tertiary Group covers the entire Tirap district leaving a small area covered by the metamorphic rocks along its eastern margin

The Tertiaries comprise mainly hard gray sandstone, silty clay, coarse pebbly sandstones, plays, siltstones and boulder beds with fragmentary plant remains and stringers of lignite This rock suite is considered equivalent to the Lower Middle and Upper Siwaliks of the main Himalayan belt and vary in thickness up to 4000 m. In the Lohit district a major part of the Tertiary rocks is covered by a thick pile of recent sub recent alluvia

In the Tirap district, the Tertiaries are the easterly extention of the rock units extending along the Naga-Patkai Hills The Lowermost unit is called the Disang Group. The Disangs consist of dark grey to black, slaty, sandy to cherty shales and fine flaggy sandstones. This Group is overlain with the Barail Group consisting of sandstone shales and clays with workable coal seams. Barail group is overlain with the Tipam Group consisting of greenish to mottled sandstones and mottled clays The Tipams are overlain with the Dupi Tila (Namsang) Group consisting of coarse sandstone, pebbly sandstones and clays with semi carbonised plant remains The Dupi Tilas are overlain with the Dihing Group consisting of boulder beds, loose sand and clays

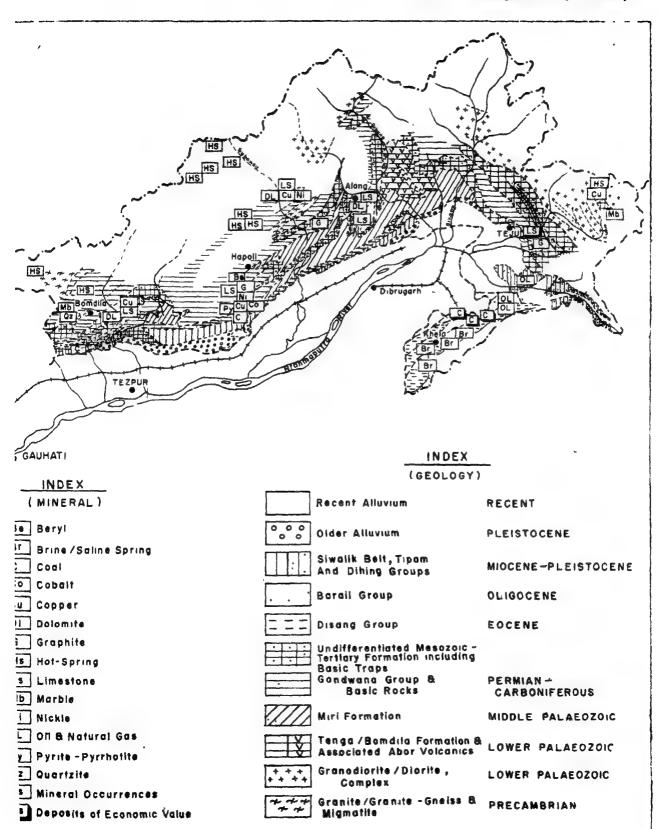
The Barail group is the source rock for oil and natural gas found in Mana Bum, Miao and Kharsang areas of the Tirap district. In the Disang Group occurs several saline water springs in the Barduria area of the Tirap district

Along the foot-hills along the southern and western boundary are scattered patches of older Alluvium consisting of thick pebble/gravel beds, loose sand and clays covered partly by the Newer Alluvium consisting of sand, clay, silt and shingle beds.

Exploration

Arunachal, in fact, remained more or less a 'terra incognita' so far as mineral wealth and its development is concerned because of challenging problems offered by the highly rugged nature of the terrain combined with large expanse of thick

Map Showing the Geological Formation and Mineral Resources of Arunachal Pradesh

(Courtesy : Geological Survey of India)


forests and very limited land routes. Such problems continued to affect the mobility and intercommunication facilities, so important for speedy and effective field exploration aimed at finding and assessing mineral deposits.

Consequent, however, to the intensification of the activities of the Geological Survey of India by establishing the Arunachal Pradesh Circle office in 1969 and with the increasing developmental actvities during the last few decades towards improvement of road communications in the State, a number of occurrences of coal, peat iron ore, polymetallic sulphide ores, graphite, clay, limestone, dolomite and building stone have come to light. Besides, occurrences of radio activity and oil in some parts of Arunachal have also been noticed in recent years. The salient features of different mineral deposits are presented below:

Coal : Coal (as well as oil and gas) have been known to occur in the plains and in the foothills of Patkai range in Tirap district. Occurrence is found in Tertiary group of rocks which date back to 40 million years. The deposits are confined to Namchik-Namphuk and Miao Bum Coalfields lying at a distance of 9 km and 40 km respectively from Jagun village which is about 11 km away from Likhapani Railway Station on the N.F. Railway.

In fact, the Namchik—Namphuk Coalfield happens to be the eastern extension of the Namdang synclinal fold of the adjacent Makum Coalfield

Existence of as many as five workable coal seams have been proved, of which the middle seam ranges in thickness from 4/5 to 19 m and the rest 1 to 5 m only.

The coal is generally of high volatile, high sulphur, subituminous type Reserve is estimated at 90 million tonnes, of which 17 million tonnes have been proved by drilling.

Miao Bum Coalfield is however the easterly extension of the Namchik-Namphuk deposit. Two major seams have been established in the area with a cumulative thickness of about 10 m and a reserve of about 6 million tonnes within a depth of 200 m down dip.

The Central Fuel Research Institute proved the suitability of Makum coal as a coking blend with the Jharia-Raniganj coal. It is expected that the Namchik coal may also prove to be equally suitable. The coal in general is suitable for use in the manufacture of synthetic petroleum and subjection to low temperature carbonization and generation of thermal power.

Some crushed and powdery coal occurs as interbedded seams with sandstone and slaty shales of Gondwana age (about 250 million years old) just north of the foothills in Kameng district. At places the seams attain a thickness of 5 m or more.

Occurrence in a tectonically disturbed disposition and the resultant fracturing of the coal render it to be of doubtful economic viability. Its feasibility to mining by modern methods and consequent industrial application are therefore yet to be established.

Though the coal bearing Gondwana rocks continue further east through Subansiri and Siang districts, the coal seams deteriorate further in thickness as well as in quality.

Polymetallic Sulphide Ore . Sulphides of copper and iron, associated with cobalt, nickel and zinc occur as pockets at a number of places on the watershed of Gamje nala and Rup nala the two small tributaries of Ranga river. Chalocopyrite, a sulphide of copper, pyrrhotite, predominantly an iron sulphide and pyrite, a very commonly known iron sulphide occur in the area in intimate association The most interesting point is that the pyrite contains some cobalt, a strategic metal of which the country is acutely in short supply.

The samples of ore from the area have been tested to contain copper from 0.5 per cent upto 1 per cent and the cobalt content in the pyrite has been found to go as high as 2 2 per cent The investigation has been geared up recently and the potentiality of the deposits awaits through assessment by detailed examination that is already in hand. Their economic viability, if proved n the near future, will surely make a big impact leading to a spurt in industrialisation of the region as a whole

Sulphide mineralisation of minor importance has also been noticed near Yazali, Ziro-Tamen, Saddle and Lamdak in Subansiri district, Bara Rupak, Liromoba Kambang etc. in Siang district and Tellu Valley and Dibang Valley in Lohit district.

Limestone and Dolomite : Arunachal can boast of the widely occurring deposits of limestone and dolomite that hold stupendous reserves. A detailed study of these occurrences is yet to be completed though the deposits of limestone at in Lohit district and that of do in Dedza and Rupa are Kameng district have been ex ed in a preliminary sense.

The Dedza dolomite has traced over a length of more 1.5 km with an average thic of 300 metres. The tentative re has been estimated at 58 m tonnes.

The dolomite at Rupa is abou metre thick on the average are a few other bands in the ranging in thickness from 5 t metres. A preliminary estimate the reserve at 320 million to taking into consideration all dolomite bands that occur in area.

The quality of these dolomite a whole meets the specification flux grade variety that is require steel melting furnaces and of wh the known fields of supply are c leting fast in the country

Limestone occurs near Tiding, course quite far away from nearest railhead available now Talop, lying at a distance of 140 from the deposits. The limesto deposit extends along a length 2 26 km with a width of 170 m, ov which a preliminary estimate of r serve has been worked out at 14 million tonnes. The limestone is good quality and much of it is quit upto the specification of flux grade

It is also suitable for use in th manufacture of sandlime brick which, if produced, will imme diately have a ready market Arunachal and adjoining parts Assam.

Occurrence of limestone has als been reported from different local ties in Subansiri district viz Yaza Khetabari, Kamala river and Talih etc as well as from Dali and Kab in Siang district. Some of thes can be utilised locally for lime burn ing and agricultural purposes

Marble : White, coarse texture marble occurs in Dirang area, ver close to Bomdila-Tawang road in Kameng district. A massive and compact variety, about 30 metre in thickness has been observed to ex tend for about 20 km. on the righ bank of Bichom river. This is also exposed in the road cuttings on Sepla road

Occurrence of a high-silica, high magnesia marble has been reported from the banks of Tezu and Dor rivers in Lohit district. The reserve in these deposits have been estimated tentatively over a depth of 50 m The Tezu river deposit account for a probable reserve of 30 millio

tonnes and the latter, 48 million t.

The marbles are suitable for use as feed in lime-burning kilns and also as good building stone. Traverses undertaken in Lohit district have resulted in locating a 200 meter thick marble near Bambi village in Tellu valley and several other bands ranging in thickness from 40 m to 200 m in Dibang valley. Details of these deposits, so far as quality and reserve are concerned, are yet to be ascertained.

Graphite : Small lens shaped deposits of flaky graphite occur near Lamdak on the Ziro-Daporijo road, Subansiri District, with an indicated reserve of about 25,000 tonnes. The preliminary beneficiation tests undertaken in the Regional Research Laboratory, Jorhat, have shown quite encouraging results indicating its suitability in the manufacture of common lead pencil.

An amorphous variety of graphite occurs in schist rock near Tai village, about 37 km from Bame in Siang district. A preliminary estimate indicates that the reserve of graphite rock within a depth of 130 m, downdip, may even go upto the 10.35 million tonnes.

Around Lalpani in Lohit District (50 km from Tezu on Tezu-Hayuliang road) graphite bearing schist rocks occur in which fine to medium grained flakes of graphite is present in association with mica. Soft and earthy graphite in bands upto 1 m thick area also of common occurrence in the country rock of this area.

Total estimated reserve within a depth of 100 m down dip is about 71 million tonnes. The average graphite, carbon content is 5.86 per cent.

A small body of graphite having a width of 800 m has been reported from near Hunli. It is rather disappointing that while the reserves of graphite in Lohit district are significant these are not readily amenable to beneficiation within the existing workable economics of graphite industry.

Value of this mineral lies in its use in the manufacture of a host of important articles like crucibles, furnace lining, carbon brush and pigment for paint. Its use in the manufacture of common lead pencils as the principal ingredient carves out a prominent role for it in the shaping of small scale local industries in the State. Manufacture of sophisticated articles other than lead pencil demands a high degree of purity. Whether the graphites of Arunachal can attain that purity or not is too early to comment now.

iron ore have been reported from Lamdak, Godak, Tala (Kamala valley) etc. in Subansiri district, and near Tribin, Late, Yomcha etc. in Siang district. These can be utilized locally in the manufacture of domestic and agricultural tools in small scale industries.

Rock Phosphate : Some dark coloured shales and calcareous bands occurring in the Gondwana rocks indicated P_2O_5 content upto 7 per cent. No distinct zones of phosphorite however could be located so far. The marine intercalations occurring in the said rocks are however considered potential for rock phosphate concentration. Only traces of phosphate were found in rocks of several localities in Siang district. Sometimes after grinding phosphorite can be used directly as fertiliser while it can also go into industry for the manufacture of ferti-

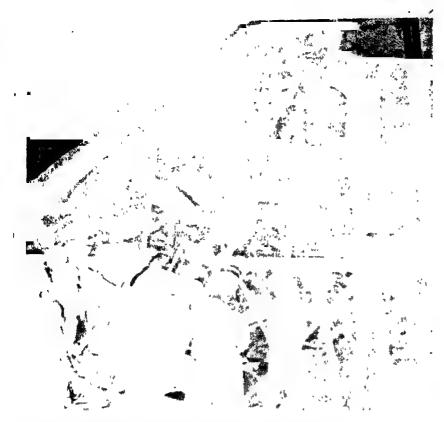
Iron ore : Small occurrences of

lisers like super phosphate.

Saline Springs and Efflorescence : Saline efflorescence within upper Tertiary sandstones, (10-20 m.y. old) locally known as "pung" and often used by wild animals as 'salt licks' are observed in a number of localities in Kameng, Subansiri and Tirap districts. The 'Brine wells' in Tirap were once upon a time the main source of salt in the region. This source however came to be neglected after commercially manufactured salt entered the local market.

The widespread occurrence of brine warrants critical examination of the Disang Shales for locating zones rich in potash salts that find use in the manufacture of fertilisers.

Thermal Springs : About 30 hot springs were located in Subsnsiri district as a result of the Multidiscip-

A hazardous crossing of a river by a ropeway in Lohit District. *Photo courtesy I.A. Khan*


To the exploring geologist and the miner, Arunachal offers a hostile welcome. Still, young and intrepid scientists and workers enjoy the challenge and the thrill.

Arunachal's Response to The Challenge of Development

K A. A. RAJA
Lieutenant Governor

ANY one visiting Arunachal Pradesh for the second time after a lapse of 20 years will see that the territory and its inhabitants have changed beyond recognition The achievements in the field of education, health, agriculture, horticulture and communications are so striking that they can only be characterised as a revolution The rich, untapped resources of the territory are its hydel potential, minerals and horticulture products. The enthusiasm with which the people have responded to the challenge of development is the most promising indication that the future of Arunachal is secure A good deal of hard work has gone into building the Arunachal of today and much more yet remains to be done to make it a towering asset to the nation

SHRI B.K NEHRU, the former Governor of the five North-Eastern States and now India's High Commissioner in England in a recent article, while discussing the socio-economic transformation in Arunachal Pradesh has observed: "To bring about this transformation in the course of a generation in an area in many parts of which the wheel of a helicopter was the first wheel the inhabitants ever saw, and to bring it about without any violence or any loss of identity is an achievement the like of which I am not aware of in any part of the world".

The above observation by an illustrious administrator, who headed the administration of this Union Territory for five years summarises the long story of progress that Arunachal Pradesh has made after Independence. This is indeed a fascinating story The manner in which Arunachal Pradesh has been trying to make up for the neglect of centuries is unique The territory has taken rapid strides in different fields and any casual second-timer to this remote north-eastern corner of India can sense the breeze of change that has now been sweeping across its hills and valleys without disturbing the even tenor of life of the people.

What has happened in Arunachal Pradesh in the last few decades is a silent revolution and the story of this 'leap-forward' should begin with a brief account of the progress made in the field of education. It is here that progress has been phenomenal, and to those who might have visited this region about 20 years ago it might even appear incredible

In 1947 there were only three schools with a student strength of about 75 for the entire territory covering an area of 83,000 sq. kilometres Today, there are more than 700 educational institutions of various types including 700 LP Schools 80 MW Schools, 21 Higher Secondary Schools and a College providing Arts as well as Science courses Over 45,000 students are studying in these institutions Besides, nearly 500 students, including a large number of girls, are pursuing higher studies in different parts of the country The people of Arunachal Pradesh now boast of schools of really very high standards, particularly the two Ramakrishna Mission Schools at Along and Deomali and the Sarada Mission School at Khonsa. Within a period of 25 years the percentage of literacy has gone up from almost nil to 11 20 The most striking feature in the matter of expansion of educational facilities has been the tremendous urge of the local people to get their sons and daughters educated The villagers come forward voluntarily to construct the school buildings and living quarters for the teacher. The demand for more schools continues to grow and, in fact, occasionally we find it difficult to cope with it due to constraints of trained men and money. Education has been diversified and more stress is being laid on science teaching. Whereas even in the late forties there was not a single graduate in Arunachal Pradesh, today Arunachal has produced its own

Engineers, Doctors, Professors and Administrators.

Arunachal has also contributed in her humble way to the defence forces with two Commissioned Officers — one in the Army and the other in the Air Force. The new generation that is coming up has developed a sense of belonging to a bigger society that is 'India' and have brought the Arunachal society gradually into the main stream of India's national life. By any standard, this is an impressive achievement.

The biggest development prerequisite of the territory was, and continues to be, communications. Fortunately this need has been substantially met. Although development of communication in an area with formidable mountains and turbulent rivers and streams is always a problem of great magnitude, the determination of the officials and the enthusiasm of the local people have helped to overcome these hurdles. Steep mountains were bored, hard rocks at dizzy heights were cut and turbulent rivers were negotiated and bridged. Roads came up in different corners, opening up considerable areas of the Territory. When the country attained Independence this frontier belt had only two roads covering a little over 100 kilometres. And today, there are nearly 3000 Kms of surfaced roads besides more than 4000 Kms of bridle paths and porter tracks. All the district headquarters and almost all the subdivisional headquarters besides a number of remote administrative centres are connected by all weather roads. Transport services, both passenger and goods, ply on a number of these routes. Twenty years ago, no such transport service existed. Recently the Government has introduced State Transport Service on two selected roads and the proposal is to extend these services to all the other important routes.

Public Health was one of the most neglected sectors in Arunachal Pradesh even immediately after Independence. Although a healthy society pre-requires good and adequate medical coverage for the people, hardly anything was done in this regard, till about 1949. The population remained uncovered except for occasional visits of doctors touring with administrative columns. There were only two dispensaries for the entire territory and these were located at the foothills. Things have since improved tremendously. Today, there are 120 Health Units, Hospitals and Mobile Medical Teams, including 9 General Hospitals. Nearly 1200 beds have been provided in the hospitals. Specialised services have been introduced and X-Ray plants and Public Health Laboratories established. There is a doctor for every 3,363 persons, a nurse for every 5,701 persons and a hospital bed for every 393 persons. The average availability of doctors and hospital beds per 1000 population is higher in Arunachal Pradesh as compared to all-India average. More than 100 Health Assistants and an equal number of Auxiliary Nurses and Mid wives have been trained from among the local people. The most noteworthy thing in this regard is the change of outlook of the local people towards scientific treatment of diseases. There was a day when the villager was averse to the idea of visiting a hospital for treatment of any ailment. He would call the village medicine man or the priest for cure. This attitude has undergone a radical change. The villagers now invariably consult the doctor even for minor troubles The village medicine man is being gradually replaced by the doctor, not because the Government has forced the doctor on the people, but because the people themselves have opted for him.

Arunachal's economy is basically rural and agricultural, as nearly 95 per cent of the people either directly or indirectly depend on agriculture. And yet, this vital sector of the people's economy remained neglected and disorganised. Twentyfive years ago agriculture in this area was poor and the activities ranged from 'food gathering' to cultivation through slash and burning, commonly known as Jhooming. It was from the late fifties, particularly from the beginning of the Third Five Year Plan, that systematic efforts have been made to improve the traditional and backward agriculture of the Arunachal area. A multipronged drive was launched to develop agriculture. It included expansion of area under permanent cultivation, developing land for permanent cultivation, better irrigation facilities, introduction of improved methods and extensive cultivation, development of animal husbandry and horticulture etc.

The organised efforts of the government, aided by people's enthusiastic cooperation, have paid good dividends. In the First Five Year Plan, for instance, the investment in agriculture was only Rs 29 lakh and

Health services in Arunachal Pradesh are better than the All-India average

the local food production at the end of the First Plan stood at only 57,000 tonnes Allocations in subsequent plans were substantially increased and the Fifth Plan allocation for agriculture and allied sector is of the order of Rs. 1096 lakh. Food production during 1975-76 increased by 4,500 tonnes bringing the total annual food production to a new height of 96,000 tonnes. The gap between the territory's requirement of food and local production has thus been substantially narrowed. Some of the important schemes under agricultural development programme were expansion of permanent cultivation to replace Jhooming, introduction of high yielding varieties, expansion of irrigation facilities and development of horticulture. An area of nearly 22,000 hectares is now under permanent cultivation.

The most interesting part of the story of agricultural development in Arunachal Pradesh is the unique response from the local tribal people to new ideas and methods. An example will bear out this statement. In the Basar area of Siang District the local farmers tried as many as 82 different varieties of paddy of which 12 varieties were finally found to be suitable and they have introduced all these varieties in their fields. Horticulture has been developing fast and Arunachal apples have already captured markets in Assam. The Government have decided to go in a big way in regard to introducing plantation crops and other cash crops suitable for the territory. in fact, preliminary works for raising tea plantation over a compact area of 1000 acres in Siang district have

already begun.

Arunachal Pradesh is endowed with vast forest wealth awaiting commercial exploitation. The forest resources are being tapped and extracted on scientific lines backed up by a programme of replantation. Annual forest revenue has been steadily increasing during the last twenty years and now it totals nearly Rs 2.20 crore. Nearly 7,500 sq. kilometres of forest area have been reserved and over 11,000 hectares of plantations have been created. Similarly, progress in the matter of natural regeneration has been steady - the area under natural regeneration having gone up nearly 112% during the last 20 years. As regards forest industries, three big saw mills have been in operation and a number of smaller units have also sprung up in different parts of the territory run mainly by local entrepreneurs. For better management of forests as well as to raise various cash crops which have great scope in the territory, a Forest Development Corporation is being set up shortly.

Steady progress has been recorded in the cooperative sector. There are now 104 cooperative societies including a number of Transport and School Cooperative Societies. The performance of these societies has been encouraging. The cooperative societies are also in the process of rapidly taking over the entire public distribution system of foodgrains and essential commodities in all the land-fed stations and have almost achieved their target in this respect. They have also entered the field of procurement of paddy and mustard seeds.

Arunachal has also immense power potential—the territory's hydel power potential is estimated roughly at 20,000 MW which is nearly half of the country's total potential. A small beginning was made in 1972 to harness this potential by installing a few micro-hydel projects. Seven such schemes have been commissioned and by March 1977 three medium hydel projects with a capacity of 4.25 MW will be completed. Once this vast potential is even partially harnessed and the power thus generated is released, it will bring about vast changes in the rural society and the economy is bound to get a tremendous boost.

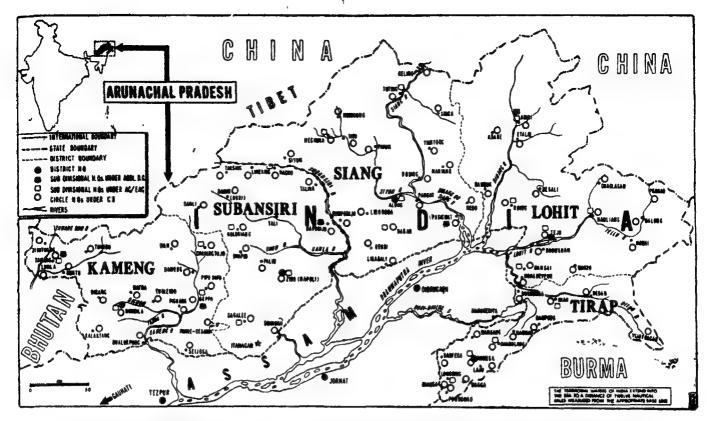
The story will not be complete without reference to the administrative and political changes which this territory has seen during the past few years. Arunachal successfully completed a long but peaceful march from the village council stage to thes tage of Legislative Assembly. The territory attained its distinctive step when in 1972 it became a Union Territory. In 1975 with a 30-member Legislative Assembly brought into being with its Council of Ministers it attained the status of a fullfledged Union Territory. The Ministry is made up of young men who have already proved their capacity to provide the State with a dynamic leadership. The Legislators have also demonstrated rare maturity in their deliberations.

The democratic way of functioning is not foreign to the ethos of the people. For untold centuries these communities have functioned through their own popular councils and one can confidently look forward to the successful functioning of the parliamentary system here. Personally, I feel excited when I look ahead at the brighter future of the territory. The march is long, but the steps taken are firm and steady. Therefore, I am quite confident that the goal will not elude the people of the sun-kissed hills of the north-east. □

THE LAND

Yojana Report Continued

A view of Daporijo in Subansiri District

Its land is not like our land,
its sky is not like our sky.
Its sky sends rain down without the originating cause of clouds;
On its ground the green grass sprouts up without any aid from the soil.
It stands outside the circle of the Earth and the bowels of the enveloping sphere.
It has been separated from the word, like the letter *aliph.*
The seasons all begin here at the time of their conclusion elsewhere.
Here there is heat in our winter and chill in our summer.
Its roads are frightful like the path leading to the nook of Dealh;
Fatal to life is its expanse lil the unpeopled City of Destru tion.
Its forests are full of violen like the hearts of the ignorar
Its rivers are beyond limit a estimate like the minds of tl wise.


The Territorial waters of India Extend into the sea to a distance of twelve nautical miles measured from the appropriate base line

These words were written three hundred years ago by Mulla Darvish of Herat who accompanied Mir Jumla in his invasion of Assam when the Ahoms were in power. When the invader entered what is now Arunachal Pradesh, he was bewildered and confused by the terrain, the climate, the dress, the customs and above all, the courage of the people. What was true three hundred years ago, was practically true in the beginning of this century. The land and the people both started changing only since Independence. Of the beauty of this area, William Robinson wrote in 1841 thus: 'Mountains beyond mountains, hurled together in wild confusion, seem to the spectator like the wrecks of a ruined world; and whilst the eye is gratified with the pleasing

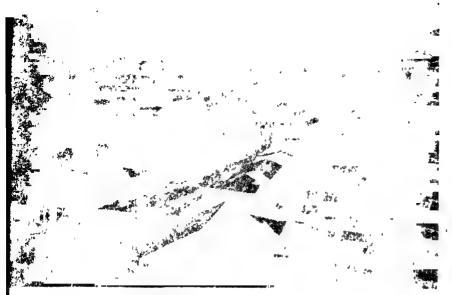
A view of Ziro town in the Apa Tani plateau

panorama, a series of hills innumerable is presented to view, retiring far away in fine perspective, till their blue conical summits are relieved by the proud pinnacles of the Himalayas towering their lofty magazines of tempests and snow midway up to the vertex of the sky, and exhibiting scenes calculated to animate the mind with the sublimest sentiments, and to awaken the most lofty recollections.,

(William Robinson : 1841)

"The snow-clad mountains all along the northern boundary, the river scenery of Siang, the pines and rhododendrons of Kameng, the austere grandeur of the Lohit Valley, the splendid uplands of the Parkoi, the gentle woods and fields of the Apa Tani plateau make the traveller feel as if the spray of an inexhaustible fountain of beauty, was blown into his face. The harshness of life on the one hand and the grandeur and liveliness of its setting on the other has had its effect on the character of the people. They are courageous in facing and overcoming difficulties and they are lovers of fine, strong and beautiful things."

Above · Crossing the river Lohit in winter. It is a canoe used by local people for fishi in the river. During monsoon crossing the turbulent river by primitive craft can very dangerous.

Below · Sun set anywhere in Arunachal is an unforgettable spectacle. The fol age, the hills, the streams and cascades add richness and colour to t already beautiful spectacle


The township of Hapoli, 1 km. from Ziro, now the headquarters of Subansiri District is a recent construction.

Arunachal is, in many respects, an unusual part of India. Its terrain is different from any that one has seen in the Himalayan region in the west. 18,578 sq. km. metres in area and with a population of less than half a million, Arunachal Pradesh stretches from the eternally snowy mountains forming the southern limits of Tibet to the hot and humid plains of Bharama putra Valley. It is bounded by Brahma in the west, the Tibetan and the Sikiang regions of China to the north and east and Burma to the southeast. The hills run like the waves of the sea, one upon another, and countless number of streams roar and murmur in the valleys below at great speed. Level ground exists more as an exception than as a rule. In the remote regions which are connected only by foot tracks passing through thick forests small communities of people live like human islands, practically living off from the rest of the world. Mostly, the local people live off the land, though in recent years with the provision of facilities for administration, education, health and so on, their day-to-day needs are air-dropped. Tribal people cultivate rice, millet or maize on the slopes of hills after clearing the forests. This is indeed a different land, and what Mulla Darvesh of Herat had to say is still partly true in areas which have not been opened up by roads and communication.

The weather in Arunachal Pradesh can also be very capricious. Even in the summer months it can be cloudy for many hours on end and the sky sends down showers without warning. Fog can be encountered by the travel-

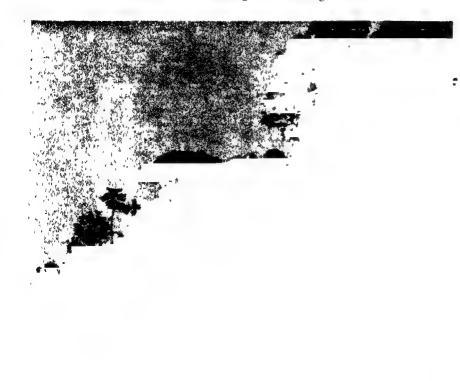
Below A road being built to Itanagar


tic lives, has influenced their architecture which has not evolved beyond pine-dwellings built on timber or bamboo stilts to avoid the dampness of the ground.

The streams and rivers are well nigh countless. They look like small, beautiful, meandering tapes of water during winter, but become raging torrents during the monsoon. When this happens, communication even for the local inhabitants becomes extremely difficult and harzardous, affecting the gathering of fuel, water and food so necessary for their living. So the local people have to devise their own unique solutions to bridge the hills with remarkable cane bridges which impress you as marvels of engineering skill. The elements — the sun, the rain, the trees and vegetation etc. are so important to the inhabitants that they attribute to them divine qualities. Nature has also endowed this difficult terrain with unsurpassed beauty. The snow-capped mountains, the majestic forests, the gurgling rivers and streams, the birds, the butterflies and almost everything that Nature has endowed on this land has created in the people an innate sense of beauty which manifests itself in their dances and their crafts.

If nature is harsh and the people are poor, the inhabitants have not been deprived of their sense of pride or courage or hospitality. There are no rich landlords here and no money-lenders to exploit the poor. The traveller will never see a begger anywhere. The people consume home-made beer and make their own cloth. Their family and traditional institutions are so organised that the infants and old people are well cared for and justice is dispensed promptly by the people's courts according to custom. Very little crime is reported. Farmers store their grain in granaries away from their homes in stilted huts with thatched roofs and they are left unlocked. Stealing another man's food is unheard of. Lying and cheating are equally uncommon and whatever religion or belief they follow, there is a strong ethical foundation to the everyday life and conduct of the people of Arunachal Pradesh.

□□□

LAND IS EXTREMELY precious to the tribal people not only because of the scarcity but also because of their total dependence on the forests and streams which provide their only source of living. To the tribals of Arunachal as it is perhaps to the tribals anywhere else, what the Government seeks to do by way of land policy and land management is of crucial importance. This is perhaps the most sensitive point in the administration of the territories. It is apparent that the one important reason why the people of Arunachal Pradesh have no serious grouse against the administration is its elightened land policy. The philosophy of the 'Inner Line' protectx the local inhabitants from encroachments on their land by outsiders from the plains. What the Government has done to promote education, health and medical services to the people is already so impressive that the village councils are usually too anxious to part with community land for the construction of hospitals, schools, experimental farms, roads or any public utilities.

In Arunachal land is owned by

Where the primitive and the modern co-exist

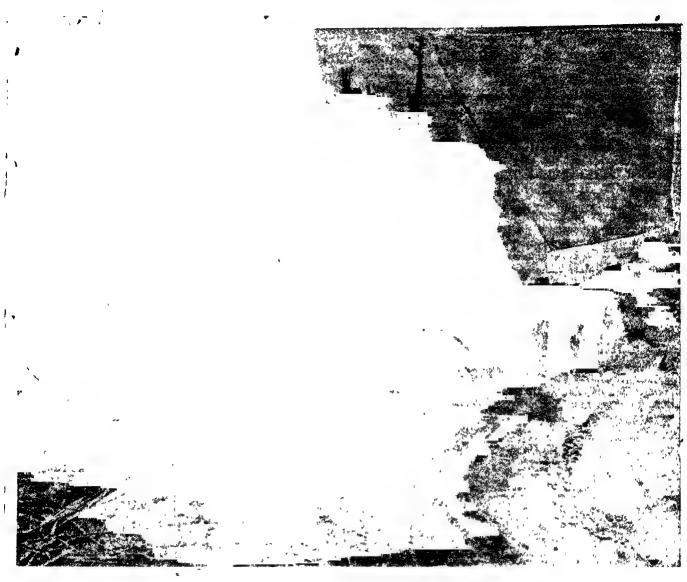
individuals, the clan, as well as t village. The Apa Tanis who inha a compact plateau in Ziro, Suban district and who have given up jhooming practice and settled d to regular cultivation have de loped a strong sense of private p perty. The Apa Tanis social sta and wealth is measured in terms of land he possesses. The clan la consists of meadows, bam groves, pines and other useful tr as well as burial grounds where the members enjoy the exclu sights for hunting. Common vill lands, however, consist of sm stretches of pasture and forests tra

The tribes which practise jhoom or shifting cultivation own lands common by tradition or agreem with neighbouring villages. It is responsibility and privilege of entire community to preserve integrity of its boundaries wi which are meadows, streams, bam bushes and trees. Individual or fa ownership is established within main framework of the comm possession. The hills for jhoom are selected every year after a cussion in the Kebang or village co cil and the priests and the en community – men, women and c dren – participate in clearing jungle, sowing and harvesting. Jho ing is a cooperative endeavour. actual cutting of trees in an


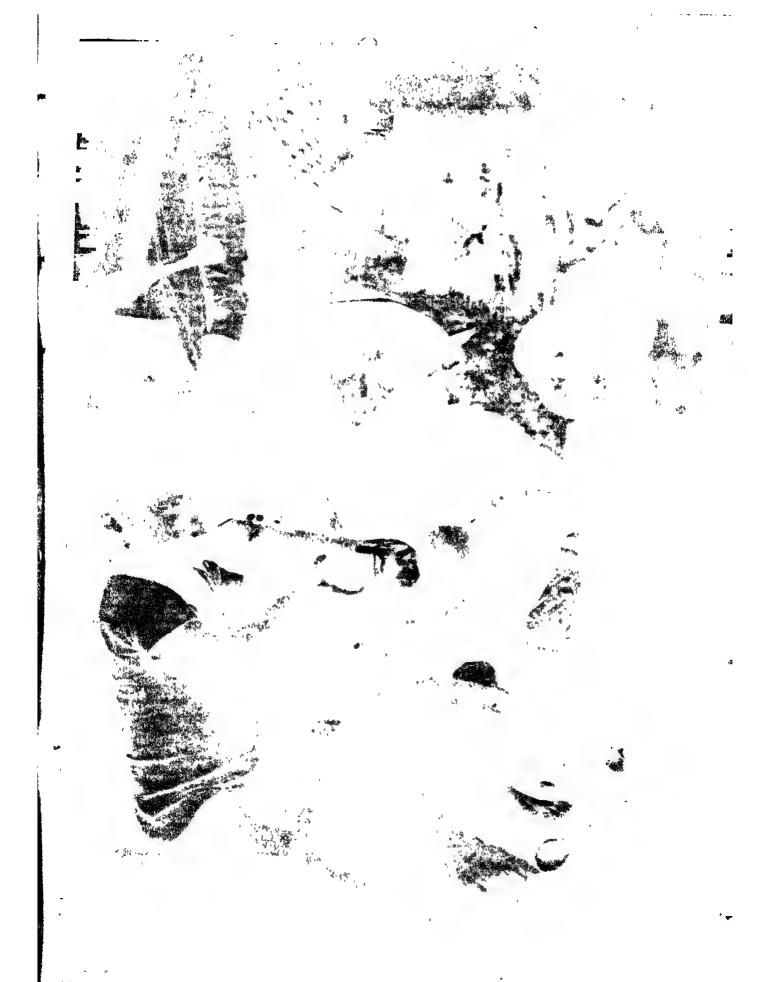
Another view of the road construction near Itanagar

marked for jhoom is a hard and arduous job which the men-folk do. Before embarking on it various religious rituals are observed to appease the spirits of the hill and forest. Whatever the principle underlying the ownership of land, no tribal will part with his land to a non-tribal and this is one reason why speculators from the plains have been scrupulously kept out from exploitation of any kind. Exploitation, if any, is done by middle-men or trader from the plains who buy the forest or agricultural produce from the tribals for marketing outside the state.

Land to the tribals is much more than property. History, legends and deep rooted sentiments bind the people to their land and land is also synonymous with reverence for their dead ancestors whose spirits are believed to haunt the place of their original habitation.

In spite of their love for landled property, the tribal people of Arunachal have a strongly ingrained social sense which helps them to undertake and accomplish projects whose benefits are likely to accrue to the whole community. No one watches on if the neighbour's house catches fire; no one is satisfied with verbal sympathies if the neighbour is taken ill. The spirit of cooperation comes naturally to them because for ages they have lived as close-knit societies, often exposed to enemy raids, floods. disease or other calamities. Verrier Elwin who made a very close study of the tribals of Arunachal Pradesh wrote, as far as 20 years ago, that 'each household, each clan, each hamlet thinks, lives and works as a single unit. In the old days of war the people used to meet together and go out to fight as a unified body. Today when peace has come to them they still retain almost military unity and discipline.'

We were able to see this spirit very much in evidence in village councils (see also article by the Chief Minister elsewhere), an institution which exists among practically all the tribals. Offences against tribal law are taken serious note of and heavy fines are imposed on the culprits by the council. Their socio-cultural tradition is such that honesty is the corner-stone of their personal conduct. There is, therefore, great scope for the spread of the cooperative movement in Arunachal Pradesh. Road building is an activity that will go on for many years in this territory. It is a facility which the people themselves value very much and while there are many instances of voluntary labour coming forward to work the road building

Facing page : The Cheery Apong is an integral part of the people's diet and children are introduced to its pleasures without consideration of age.


projects the idea of farming out long stretches of roads to a whole community on a contract basis can be tried in places where the village is practically cut off from the outside world. The tendency among the Adis, we learnt, is to take up a road building contract and employ outside labour, mostly consisting of Nepalese, Beharis, Keralites, and other south Indians. With the spread of education and proliferation of needs and fashions, money is acquiring a new value and the tribal contractors know that there is big money in this business. In principle it stands to reason that profitable contracts should go to the local people and not to outsiders. But as Shri Abraham, an Assistant Engineer in the C.P.W.D. Itanagar, observed this might eventually introduce a new class of wealthy people among small communities, given to an urban way of living and all the psychological consequences that might follow. Another engineer suggested that it may be more practical for the C.P.W.D. to manage the entire construction work with whatever labour is available, from within the territory or from without. The Inner Line' is a barrier to the migration of outside labour and it protects the people of Arunachal ideally. They have nothing to fear by way of encroachment and they know it. They have a good deal to offer by way of adopting simple intermediate technology in the field of agriculture, horticulture, house building and town planning and for starting small industries like oil crushing, carpentry, fruit canning etc.

The land of Arunachal is vast as compared to its population. Assam is smaller than Arunachal with a population of over 18 millions and Arunachal has barely a population of half a million divided into many tribes, living in remote regions, often cut off from one another and steeped in time-honoured beliefs and life styles. The question is— and it is big question—how soon is planned development going to take this sensitive region with a small population to a level which obtains in the plains.

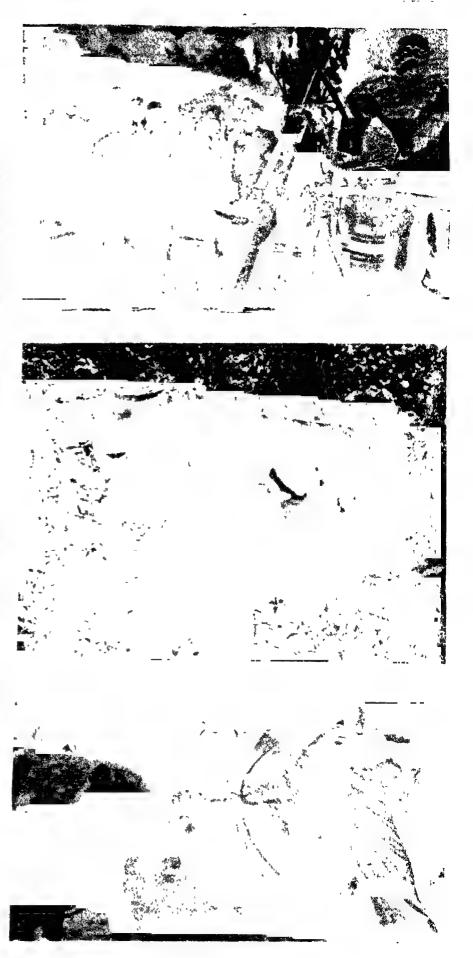
The answer has to come both from the people and the administrators. A paper plan with generous fiscal provisions will not fully solve problem. The primary question is one of involvement of the entire officialdom at all levels from the Lt. Governor and the Chief Minister to the humblest Gram Sevak. It was a most heart warming experience for the Yojana Party to sample for themselves the sense of dedication in most if not all, places.

THE MITHUN

A Mithun (bos frontalis) which extends into Burma and the Malay Peninsula, is a typical representative of an Indo-Malaya group of wild cattle. The animal is characterised by the forward curve and great elevation of the ridge between the horns. It roams about freely in the jungle in Arunachal, finding its own food and is brought home only when it is to be slaughtered or exchanged in barter.

Mithun plays a very important role in the socio-economic life of the people. As indication of social status and an essential item of requirement in most of the feasts of the people of Arunachal Pradesh including religious rights, these animals are also in great demand, and are useful as a means of payment. But as the Mithun is the highest "denomination coin" which has to be taken and paid in full, it is used in big transactions only. Mithun is also exchanged for a bride. The Apatanis never like to sell their land, but they will consider a sale, if they are offered mithuns in exchange.

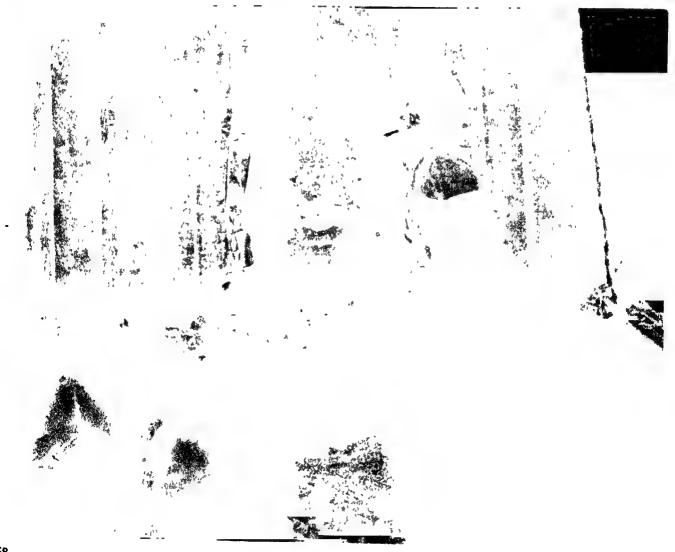
Although the Mithuns are allowed to roam freely in the jungles and breed, every Mithun recognises its owner who keeps touch with the animal off and on by offering it salt. No one steals another's Mithun and no one will part with it easily except as a bride-price or for sacrifice. An individual's affluence is often judged by the number of Mithuns he owns or sacrifices at community festivals.

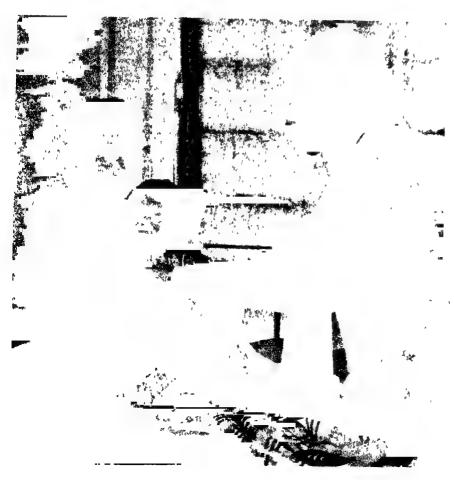
The people of Arunachal do not drink milk and even if they keep cattle, they extract no milk from their cows. The Mithun, particularly, is never milked but sacrificed and eaten.


HEALTH AND MEDICAL CARE

THE GROWTH OF health and hospital facilities in Arunachal Pradesh in the last 20 years is one of the most remarkable achievements in the development of the Territory. With over 100 hospitals, and 1250 beds and 20 mobile teams the facilities available for the half million people of Arunachal is higher than the all-India average. Not a small part of this achievement is due to the drive and enthusiasm of the Lt Governor and the dedication of the host of doctors and nurses who have opted for service in this difficult area. Many of them have still to work under conditions of great personal discomfort and loneliness, largely because of want of communications and absence of social life they are used to in the bigger towns and cities. But all of them have been provided free housing and higher allowances though this may not be sufficient compensation for the often hard life they have to live. A compensating factor, however, is that most of them are young men and women who feel the thrill of pioneering and experience the joy of extending their healing, friendly touch to people who are most in need of it.

Most common of the diseases to which the tribals are susceptible are scabies, eczema and water-borne diseases besides goitre. Goitre, however, is being tackled by supplying to the people iodized salt to the tribals. The tribals have taken to modern medicine rather slowly though with

Above Apa Tanis come to the hospital for all ailments *Below* : But with some other tribes the doctor's help is sought only when the witch doctor fails to cure. Here the witch doctor chants hymns to ward off the evil spirits


Tribal parents bring their sick children readily to the hospital. Eczema and water borne diseases are very common in the Territory.


the spread of education they have shown increasing interest in hospitals. The doctors we met were almost of the same opinion: "the people have not yet realised the value of prevention. They live in unhygienic surroundings, drink contaminated or impure water, and cannot afford balanced food. Besides, they still preserve their ancient faith in rituals and witch-doctors whose help they seek first before coming to us. It is only when these fail them they come to us for treatment and it is often too late."

There is the additional fact that the food habits of these people are strange. They are omnivorous in their eating habits and eat practically every kind of meat and many insects including a type of bugs found on the river-side which do no good to their health. Leprosy is rather common, and so is tuberculosis. Almost every major hospital has a sanatorium attached to it. Although most of the hospitals have maternity wards attached to them, they are not yet popular with the tribal women. We found many vacant beds in the maternity wing and the medical officers in charge told us that the woman who develops labour pains would rather retire into a nearby jungle, deliver herself of the child, and return home with the new-born babe in the arms! Only when a case develops complications is the doctor called in. This isn't also easy either because, for want of communications, the messenger has to walk for hours and even days along jungle tracks to reach the doctor and bring him to the patient.

In Pasighat, Ziro, Along, Bomdila and Tezu very good hospitals have been built and the bed-strength in each, which is sufficient to meet present needs, is being steadily extended. In remote villages unconnected by roads, smaller hospitals have been opened and many of them have X-ray equipment, in-patient wards, and operation theatres.

An essential prerequisite to the health of tribal communities is improvement in the quality of water supply and the people themslves are aware of this deficiency. Mostly the villagers draw water from the hill streams tapping them through bamboo conduits. We saw no wells during our visit to any of the villages. Most house-wives spend hours to obtain water, often from points several kilometres away from their home. With insufficiency of water, personal cleanliness becomes difficult and dirt and disease are normal consequences, affecting the entire environment of villagers.

Above A long queue at a hospital.

Below · The main problem with the people is environmental sanitation and personal health habits.

ITANAGAR, THE *CAPITAL*

The Brick City of Arunachal is rising from the Jungles

When the North Eastern Frontier Agency (NEFA), an administrative nomenclature given by the British rulers – became Arunachal Pradesh, its distinctive regional entity was recognised by the Indian Union. The institution of a full-fledged legislature with a cabinet of Ministers and a Lt. Governor soon followed. What it lacked, however, was a capital city of its own as the administration of this remote north-eastern region was being carried from Shillong, formerly the capital of Assam and now the headquarters of the Government of Meghalaya.

HYDEL POTENTIAL

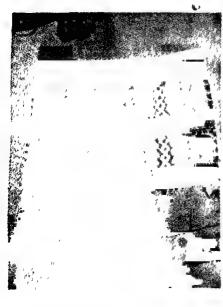
All the Hydel stations in Arunachal are mini projects.

Arunachal Pradesh has *innumerable* river streams *many of which* cascade from 150 to 250 metres. In some places as in the Dirang village, Kameng District, the local people utilise the speed of the stream to energise flour mills.

According to an official estimate made a few years ago by the C.W.P.C., the hydel potential of these streams of Arunachal Pradesh which ultimately empty themselves into the Brahmaputra comes to an astronomical 20 thousand megawatt. Theoretically, Arunachal alone can produce 50 per cent of the hydel potential of the rest of India. The local requirement for electricity and power is extremely limited, because of the paucity of industries. Engineers are of the opinion that from the same hill streams, the tail-race waters of one of the many hydel plants can be utilised at lower levels to start another similar plant. Sometimes three or four hill stations can tap the energy of the same river. The problem, however, is of finance. Although Arunachal does not have, and will perhaps never have, the capacity to utilise this potential, it is a rich source of income because most of the power produced can be sold to Assam which will be only too happy to buy it. If fully utilised, this hydel potential can earn for Arunachal a net income of around Rs. 150 crore which will be enough to more than finance all its development programmes and raise the standard of living of the entire region.

ART AND CRAFTS OF ARUNACHAL

Weaving is a very common craft in Arunachal though there are a few tribes who have never practised the art Unlike elsewhere in India weaving is almost exclusively the work of women. The looms are small and simple and the unique textile designs are invariably woven, never printed; and they have an extraordinarily rich vocabulary associated with weaving and textile designs The cloths woven by the Adis are usually red with blue lines running through the length Yellow and black and white and green are also used in combination The woman's cloth is invariably in narrow strips about 18 inches wide and two such strips are joined together to make the undergarments. The fabrics produced are invariably of pure cotton though sometimes wool and cotton are mixed

Above Now small weaving machines are being introduced at some craft centres


Right : A variety of baskets woven by women for daily use

WOOD-CARVING, some of whose specimens are of the finest kind, are practised by Wanchos, Konyaks and Phoms who live close to the Burma border. The wood carvings recall sometimes the bygone days of head-hunting or they decorate the communal houses. Besides, funerary images also are subjects of carvings. In most carvings of the human figure, the head is given prime attention and the features are usually in low relief Among the Monpas, the speciality is the carving of masks and these are beautiful examples of craftsmanship.

Wood-carvings are sometimes inspired by the need to decorate Morungs. These Morungs are not used for residential purposes, but to house the huge log drums once used in times of war

Above Monpas are excellent creators of wooden masks which are used in dances.

Below A wood-carver working a lathes.

The chieftain's house usually contains carvings on the main pillar of the room and the horizontal beam running across the front of the building The designs are varied and the Mithun and the hornbill motifs are commonly employed besides the stylised tigers, elephants monkeys, dogs etc. The hornbill is a greatly venerated bird in Arunachal and its beaks and feathers are used in the head-gear of many tribals The horn-bill is considered to be a symbol of valour while the Mithun is respected as a symbol of wealth. The carvings of Mithun and Hornbill are often realistic, though often conventionalised The art of wood carving in Arunachal is a 'warrior's art', according to Verrier Elwin and this is bound to change as the traditional skills of the craftsmen now being trained at craft centres undergo aesthetic sophistication.

Top left Reclining Buddha, a wood carving made by the Khamtis. The chain is made of fine quality of grass and it is a speciality of the Noctes

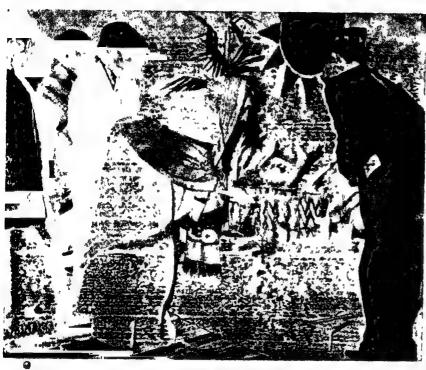
DEMOCRACY

NEEDS

DISCIPLINE

RELIGION

A proud diversity of faiths has given strength to the moral fibre of the Arunachal People


Above : Prime Minister Indira Gandhi inaugurating the new Nocte temple at Khonsa
Below . The Dyoni-Polo temple built in Along for the Adi community

Yesterday's faith is today's re- ligion is tomorrow's empty ritua Religion to the simple tribal fol which we so often tend to look a with a sneer, is an integral part o their life. It disciplines their dail conduct and community life b creating unseen bonds between Nature and Man, between famil and the clan and between tribe and tribe. The beliefs, the rituals and the attitudes which go to make up the world-view of these simple folk cannot be laughed away. This is where the social worker and the administrator who are posted in these areas have themselves to be educated if the changes they seek to bring about in the economic and social life of the people have to be real and lasting. Alienation from tradition and the time-honoured social ethics of a people can be disastrous to a people who are exposed to new ideas and modern technology. This is perhaps the field in which Arunachal's imaginative Lt. Governor has shown remarkable understanding. Jawaharlal Nehru said years ago:

> "I am not at all sure which is the better way of living, the tribal or our own. In some respects I am quite certain their's is better. Therefore, it is grosslly presumptuous on our part to approach them with an air of superiority to tell them how to behave or what to do and what not to do."

Every tribal community of Arunachal has its religion, its rituals, its superior deities and lesser spirits. The belief in a supreme God who is good and benevolent is universal. Dyoni-Polo, the Sun-Moon God of the Adi tribes bears some resemblance to INDRA of the early Vedas—ruling the skies and capable of seeing everything. The Tagin priest addresses Dyoni-Polo thus:

> *You are the greatest of all; you are above all; you see all, You see the lost things, the stolen things. At night you watch the world of the dead. In the day, from the world below, having feasted well, you come in your finest clothes, with splendid ornaments, a shining dao in your hand. You look on every side: you know everything.*

Dyoni-Polo is more a ruler than the Creator of the world and his reign in the heavens is unchallenged. Above everything else he keeps a watch on the deeds of men and extends his hand of protection to the deserving, and is compassionate. The Dyoni-Polo cult which is very

simple and is remarkably free of unseemly rituals holds together the entire Adi Community in the Siang District and even outside. The Administration's policy is not to impose on the people beliefs or practices which are alien to their native tradition but to enrich their cultural heritage by providing, within an atmosphere of freedom, centuries of institutional worship. The newly-built temple of Dyoni-Polo in Along is an instance in point. It combines the architectural features of an Indian temple with shrine and a prayer hall where the lay worshippers can gather on occasions.

A similar temple has been built at Khonsa for the Nocte community which Prime Minister Indira Gandhi recently opened. The Noctes have been under the influence of the Vaishnavites of Assam for over a century and they look to spiritual guidance from religious leaders in the Assam plains.

There are undoubtedly many beliefs and rituals prevalent among the tribal communities which have re-

Left Top **A Shiv Ling discovered by road builders enshrined in a cave temple, a little distance from Daporijo.**

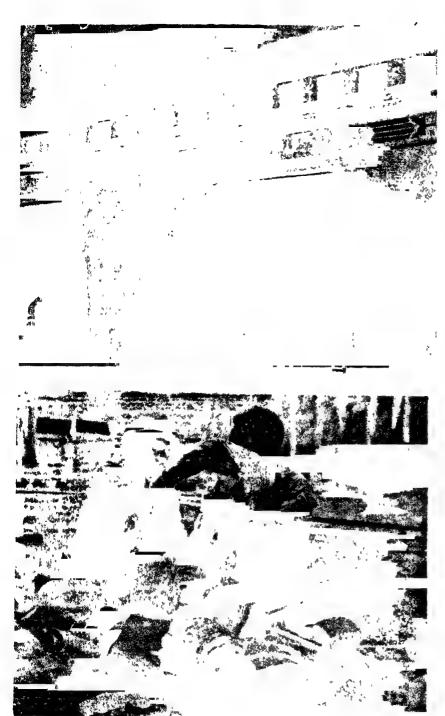
Left Bottom **A Thai Khamti Buddhist priest in the Chokham temple.**
Bottom **A 13th century image of Ganesh from Malinithan**


semblance to some Hindu cults though they do not share the myths and legends of the Hindus. Whatever the beliefs of the tribal people their tradition is not such as will compromise with the caste system, vegetarianism or taboo of beef and beer. Nor are they likely to view with favour any brand of puritanism in the name of religion. It is not the policy of the Government to mix up programmes of economic development with the beliefs of the people and where the two do clash, as for instance in the field of public health or social environment the policy is to promote change through education and personal example. The keynote to the philosophy of administration is to preserve the social ethic which is associated with tribal religion and which has helped to preserve the pride and nobility of conduct of the Arunachalis.

Marriage as an institution is not related to religion by any of the tribes; but marital fidelity is a virtue which is valued as much as religion. So are the virtues of truth-speaking, hospitality, hard work and kindness. One often wishes that the so-called civilized communities of the plains in whose value-system religion holds an important place gave equal emphasis to the social ethic which characterises the everyday life of the Arunachal people. Translated into material terms, these virtues would add both speed and equality to the entire process of economic development.

THE PROBLEM OF THE UNDER-PRIVILEGED IS A HUMAN PROBLEM

I would be very happy if the Scheduled Castes and Scheduled Tribes start forgetting that they are Scheduled Castes and Scheduled Tribes; they are Indians who have had a bad deal for centuries. They have not had opportunities for development. They are entitled to these opportunities now and we are doing our best to give them. But if we try to perpetuate the caste system, then it is very difficult to ask other castes not to give way to their own feelings. Either we are all Indians and are all equal or everyone will want something for his own group It is not something we can achieve in a few years, but it is something for which, I think, that we should work very hard.

The problem of the under-privileged is not only they are more economically backward than the others and it is a human problem, a problem of human suffering, but it is also a problem that they have neither their full rights under the costtritution nor can they fulfil their duties towards the country. So we have large masses of people who are not really being able to pull their weight so to speak. We must enable them, to know what their rights are and to live up to the corresponding obligations.

Indira Gandhi

IN ARUNACHAL PEOPLE LOVE TO SING AND DANCE

Left : An old Nocte warrior demonstrates his skill at dance before an admiring audience.

A group of Aka girls dancing. Aka women are extremely fond of ornaments consisting usully of silver chains made of coins and bead decorations and ear-rings made of silver.

Delong, an Adi fencing dance, Pasighat. The movement is very vigorous and the dancing party splits itself into two and dance together as two groups. This is usually done after killing an animal in a hunt.

ONE OF THE chief inspirations for the other arts is the dance, itself the art in which the tribal people find supreme expression of their sense of order, rhythm and delight. To most of the frontier tribes, moreover, the dance is something more than recreation it is a very serious business. The Monpas, Khampas and Sher-

A masked dance by the Lamps of Tawang

dukpens perform their pantomimes, not for show, but at festivals to teach important moral lessons and to bring prosperity or avert disease. The Wanchos and Noctes dance to celebrate victory in war, to encourage the crops to grow and when they bring in the harvest, to give colour to a great feast, to bestow blessings at a wedding The Mishmi priests dance at the time of sacrifice or funeral and for their festivals. The Adis, who have a strongly developed sense of the dance as recreation, also have their ritual dances at which the epics of their race are sung.

This naturally stimulates every form of artistic creation. The dancers put on their best skirts and coats, bring out their finest hats, decorate spears and daos, paint fresh designs on shields, and cover themselves with ornaments, from precious traditional beads to flowers and strips of greenary. The wooden heads and figures popular in Tuensang and Tirap are brought out now, even if they have remained hidden for months, and masks are prepared and painted with fresh colours...

The number of dances particularly, mong the Monpas and the Sherdukpens have certain moral lessons to teach. Compassion to animals and human being and retribution for sin committed in this life are conveyed through dances and pantomimes. The masks worn at these dances are painted in bright colours. Women dancers do not wear masks. And in Tawang only the lama dancers wear masks.

A colourful tribal dance in a village organised on the occasion of the community festival

VIGNETTES FROM ARUNACHAL

No story of Arunachal and its people can be fully told and no comprehension of the immense power of the environment over man is possible unless one actually savours the pleasures and the pains of a journey through this picturesque but difficult land. The constraints imposed by the terrain and the neglect of centuries are being steadily overcome. In the last three decades, roads, electricity and schools have accomplished what centuries of history failed to do for these simple, hard-working people. There are far too many facets to the visible and invisible changes that are coming over them. They cannot be covered in the course of a short tour. But pictures often succeed when words can at best attempt to convey.

Arunachal's five districts- Kameng, Subansiri, Siang, Lohit and Tirap are inhabited by several dozen tribal communities, each with its own traditions, myths, dialects, costumes, headgear, dance and art forms. Cutting across this diversity the people share a comon desire to leap the centuries. They are not averse, either, to weave their different cultural strands into a homogenous regional fabric even as the innumerable streams of the territory go to swell the mighty Brahmaputra.

To those who live too far away to make it to the hills and tribes in this extreme north-east of India to savour

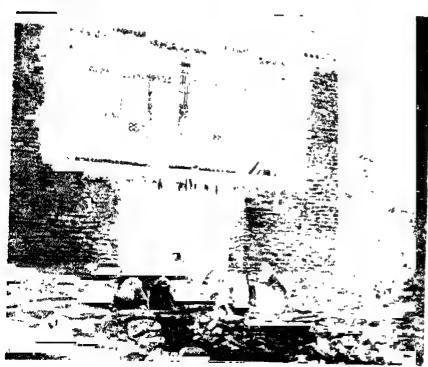
Above and Below **The Monpas live as well-knit communities in villages. Their houses are invariably built of stone, timber and wooden planks. The women do practically all the house-hold work.**


MONPAS OF KAMENG

The Kameng frontier district, situated in the western-most part of Arunachal Pradesh provides the easiest and perhaps the most exciting introduction to the visitor. There is a beautiful, 190 kilometre road that takes you by jeep or bus from Tezpur to Bomdi La, the headquarters of the District, from where Tawang, reputed for its 350 year old Buddhist Monastry is another 8 hour run by jeep along a road that runs up and down the hills like a crazy serpent, This is the home of the Monpas, a gentle, friendly, industrious and hospitable people who follow Lamaist Buddhism. Skilled in the arts and scholastic Buddhist lore, they love religion as much as they love flowers They love ceremonials and dances. The mask dances of Tawang Lamas are colourful and even spectacular.

RICH CULTURAL HERITAGE

The Monpas, in spite of their hoary cultural tradition are poor and their life-style has a distinctiveness. The traveller can easily recognise a Monpa village by the architecture of the simple houses, built mostly in stone, matted bamboo and wooden rafters and planks. Rupa, Dirang and Sangti villages in Kameng which the Yojana team visited

Above : A Monpa home. A women sifts grain in an open yard before her home.
Below : The Monpas slel and exchange their farm produce at periodical village markets.

have not shown much change except for the new residential settlements built by the defence and border roado rganisations The stream of life flows on for the average Monpa as it has done for centuries and the little Gomphas and fluttering prayer flags continue to make eloquent announcement of the people's deeprooted faith, in Buddhist symbols of worship. Women do most of the housework, pounding corn, cooking, collecting water and fuel, washing the family linen, and caring for the children. Many families still send their children to local lamas to learn the three Rs. They are not

The Kameng District is famous for orchi which grow wild and which, when cultivate and marketed, can be a good source of ad tional income.
Although found at 5,000 ft. altitude, orchids c be grown also at lesser elevations. Arun chal alone produces as many as 350 speci of orchids.

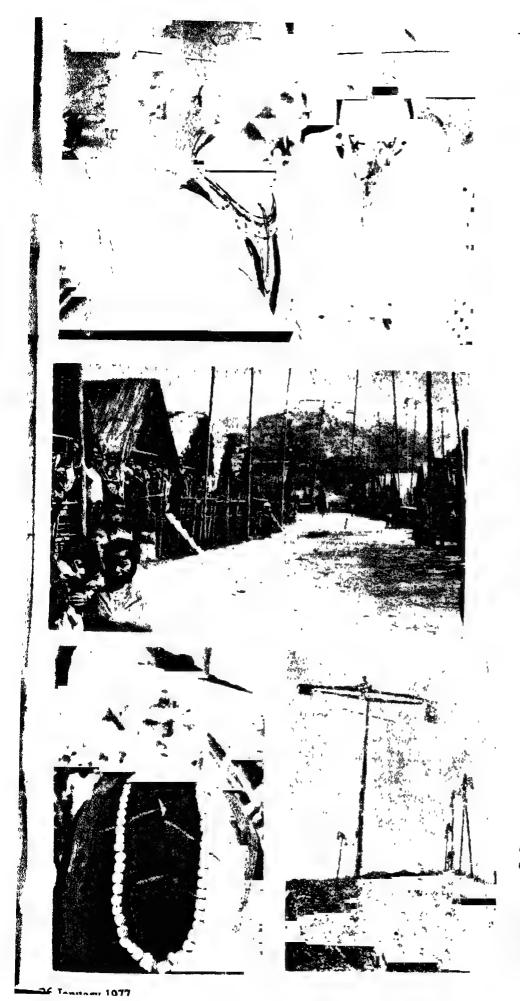
vegetarians and like all other Arunachalis, they make beer at home which is served with pride to guests Modern education has made some dent in their traditional living but except for stray personalities who have entered the professions or politics through the legislature, not much change is discernible They have miles and miles to go before they can transform their ancient villages and introduce a semblence of the habitat conecpt. This in itself may not be so important as the need to improve their agricultural and other farming practices which are bound to improve their economic status The Monpas and Sherdukpens grow maize and also eat wheat The Sherdukpens are relatively a smaller community and the present chief Minister of Arunachal belongs to it.

The Monpas are excellent weavers and they are highly skilled in the art of carpet -making. weaving is mostly women's job and the exquisite designs of Monpa carpets find a wide market oustide Arunachal

The Monpas are a well-knit community, religious, proud of their Buddhist heritage and submit themselves to the guidance of their headman

A peculier characteristic of the Monpa village which you cannot notice in other districts is the construction of what are known as manes, which is a stone wall about three to six metres long and about two metres high on which the sacred formula OM PAIN PAME HUM carved on tablets are imbedded, to ward off evil spirits.

Above A green house of orchids run by the Government in the Tipi valley which is only 800 ft. above the sea level.

Bottom A highly valued piece of silver jewellery worn by tribal women in Kameng.


APA TANIS

Perhaps the most well-kn of the tribal communitie Arunachal known to out ers are the Apa Tanis, T are distinguished from other tribes in many w their delicate features slender build being perh the most important. Ur the other tribes they have centuries been practising led cultivation on a 26 sq Km. plateau in Central ansiri at an altitude of al 1500 metres, surrounde steep mountain ridges clot in bamboo bushes and for The men and women tattoo marks on the which mark them out f other tribals. The males a cane helmet of beau workmanship and tie up t hair into a knot as the N do, with a skewer stuck t ugh it horizontally, The is tattooed with three ver strokes and they wear a g of canework with a tail, a of dress unique to them.

Equally distinctive are Apa Tani women who enormous nose-plugs w help to subdue rather enhance their natural bea The practice, though wi prevalent, is now being discarded by the you generation with the appr of the elders The Apa women wear skirts, like men folk, made of gray with bluish borders w reach upto the knee and orate themselves with of bead-necklaces.

no traditional institution with centralized authority though most of the village affairs are disposed off at informal council called the Buliang. The Morom and the Mloko ceremonies connected with farming activities, are great festivals among (usually December-January and March-April) when they dance and feast

Unlike the other villages the Apa Tani village conforms to an arranged pattern, divided into quarters occupied by specific clans of the tribe. Within each village social life and inter-family activities move around the Nago and the Lapang, each of which is a focal point The Nago is a shrine and a centre of community rituals

The Apa Tanis are good cultivators and put every square inch of their farm land to an effective use. Today a great transformation is coming over the Apa Tani plateau. with demonstration farms, hospitals, schools crafts centres and an increasing number of visitors from outside the Apa Tanis have broken, their age-old isolation.

The Mishmis

The Mishmis who inhabit part of Lohit District are also migrants who came to the valley centuries ago. There are several clans among the Mishmi Tribe-the Idu Mishmis, the Digaru Mishmis and the Miju Mishmis. The clans have sub-clans which are exogamous. The Idu Mishmis cut their hair round the forehead while the others prefer to wear thin silver plates round the forehead and sport large trumpet -shaped ear ornaments.

They are short-statured and have pronounced Mongoloid features. They like strongly dyed clothes and the Mijus

Above: An Ida Mishmi woman making home-made beer.
Below: An enormous hollow trunk used by the Mishmis as a Tom-Tom drum. This drum is placed inside a *Morong* of boys' dormitory. Similar drums were also used by other tribes like the Wanchos, Noctes and Monpas.

and Digarus wear skillfully woven cane hats. Like other hill tribes they live in long bamboo houses scattered over a wide area, perhaps one reason why we do not find among them highly evolved village communities. A rich man's house can be often as long as 100 feet or more, built completely of bamboo and roofed with thatch or woven bamboo.

Like the Adi women the Mishmis too are very good weavers But they have succumbed of late to cheap bazar textiles and weaving as a craft is somewhat on the decline among these people.

A few passing glimpses of Nishi children and Gallong women. The children (*above right*) seen during an out-door drill before their school near Ziro.

The Khamtis

The Khamtis who inhabit the Lohit District live close to the Mishmis, but unlike the Mishmis they are not a hill tribe. They migrated to Assam from an area close to the source of the river Irrawaddy and settled down on the bank of the river Tangapani with the permission of the Ahom Kings. Towards the close of the 18th century in the wake of confusion and distress caused by a civil war in the Ahom kingdom, they crossed the Brahmaputra, drove away the Ahom administrator at sadiya and the Khamti chief usurped the title and the dignity of the office. Soon they were in full control of the Sadiya region. Early in the19th century, the British gave them formal recognition. After a brief spell of suspicion and open confrontation with the British culminating in eventual submission to the colonial authority, they were allowed to settle down in their occupied land,

The Khamtis are devout Buddhist and culturally have been more advanced than the hill tribes. They are very good farmers and possess a lot of enterprise. The Khamti temples are examples of wood carving and they have a rich heritage of skills in weapon making, basketry and cane craft. They love silk fabrics and they are very good at weaving

They live in houses built of stout timber frame raised on a platform and roofed with thatch.

CHILDREN, SCHOOLS, AND THE R.K. MISSION

Where to see
Is to admire,
To admire
Is to flatter,
And to flatter
Is to amulate

"I am an Indian, India is my country.
The Indian is my brother.
The Indian is my life.
The soil of India is my highest heaven, the good of India is my good".

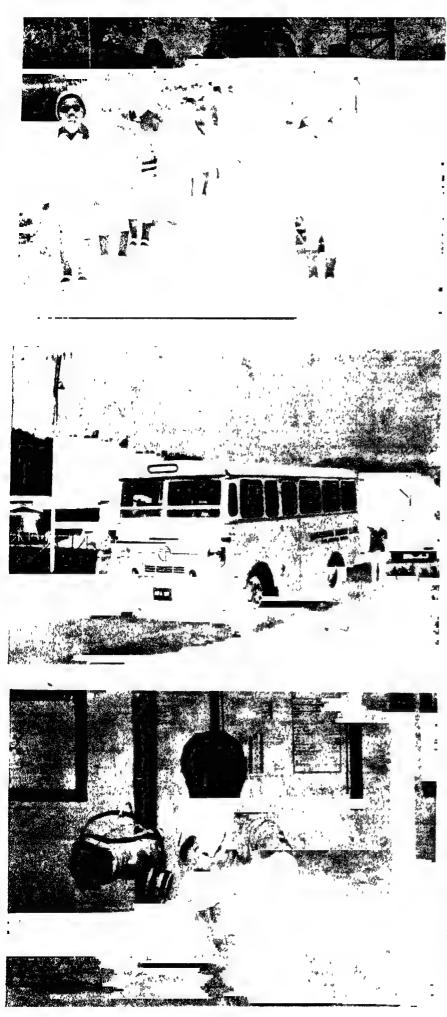
"I pledge that in all my thoughts and deeds, the safety, the honour and welfare of my country shall come first, always, every time."

This pledge, boldly painted on a board greets the visitor as he approaches the Rama krishna Mission School at Narottam Nagar near Deomali in the Tirap District of Arunachal Sentimental? Perhaps But they are not the sentiments of a chauvinist They are the corner-stones of the system of education which the two Ramakrishna mission Schools for boys and the lone but excellent Sharada Mission School at Khonsa impart to the tribal students of Arunachal Pradesh Qualitatively, these three schools stand apart from any of then kind in Arunachal or, for that matter, many parts of the country.

It was a heart-warming experience for the Yojana team to visit these institutions, meet and talk with the management teachers and witness the immaculate cleanlines, discipline and cultivated taste that permeated the entire campus In her letter to Swami Prmathananda of the Narottam Nagar School, prime Minister Indira Gandhi paid a glowing tribute to its management She wrote "What a pleasure to find the lives of the tribal boys of Arunachal Pradesh being illumined by the high and noble

Top **A dining hall in the Sharada Mission School**

Middle · **A boys' dormitory in the R.K. Mission School, Deomali**

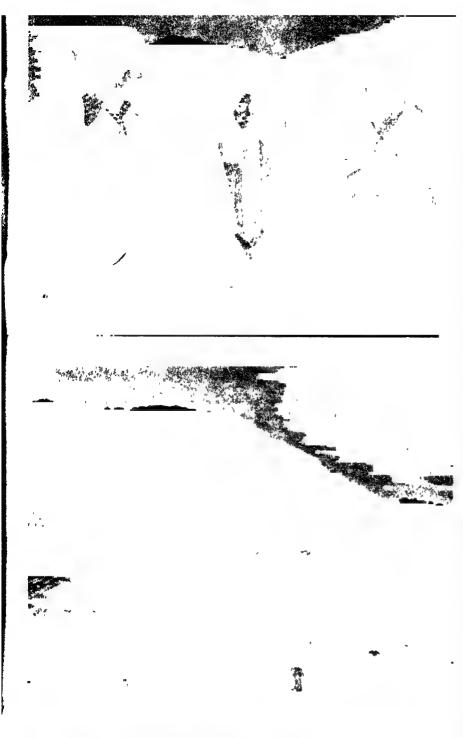
Bottom : **Children at plav at the R.K. Mission School, Along**


ideals of Pramahansa Ramakrishna's and Swami Vivekananda's teachings. Swami Vivekanand's ideas on education are in consonance with contemporary thinking on the subject. He also lays the greatest emphasis on the spirit of unity and of nationalism, so essential to the India of today

Having discussed, in its essentials, the basic problems of education in relation to development earlier, the only provocation to go back to the subject in this and the following pages is to pay a brief tribute to the contribution that the R K. Mission schools have been making in Arunachal to build the ethical and intellectual foundations of a new society for the tribals who are too anxious to leap the centuries.

What is distinctive about these schools is not the ideals, but the way they are woven into the general texture of management, teaching, and the entire process of learning. The visitor tends to return with unmixed admiration because they present a convincing contrast to the many thousands of schools he might have seen in the countryside and the tribal areas. These are the schools where the child, once admitted, remains until he or she completes the matriculation level. They are all residential schools and the medium of instruction is English in all classes from the preparatory to the highest class. They are affiliated to the Central Board of Education, New Delhi

For the children the day starts early with a morning congregational prayer in the large, beautiful prayerhall

Top : **Kinder-garten children on a morning drill in a Govt. Primary School, Tezu.**
Middle :**A school bus run by the R.K. Mission School. Along, for non-resident students.**
Bottom : **A tribal boy in the tenth class participating in a students science exhibition at Itanagar**


attached to the school and the day ends again with prayer. While no discrimination is encouraged between religion and religion, the pledge taken everyday by the pupils is to promote the glory of the motherland. The kitchen is common, the dining is common. There is no taboo on meat. The food, the uniform books and bed are all supplied free and any sense of discrimination among the students based on birth or wealth is automatically erased by the strict community living in the dormitories. Scout and Girl-Guide movement, sports, regular P. T. classes, manual labour in horticulture washing carpentry, cane work, clay - modelling, painting wood-carving as also music and dance lessons provide to the students a variety of hobbies and light extra-curricular activities to build up their character and prepare them in a modest way to vocational courses. There are also arrangements to give special training in scientific agriculture, poultry, smithy, cane work, tailoring, plumbing, electric-fitting, book-binding etc. which may be of practical use to them in later life.

Coming back to some of the sentiments without which an old civilization like India's can never become forward-looking, the R. K. Mission schools of Arunachal reminds the visitor of yet another saying of Vivekananda;

Let new India emerge from groves and forests, from hills and mountains.

Top : Some talented students of the Government High School, Ziro, who have participated in the production of a feature film for which the story, the dialogue, the acting and direction were contributed by the students themselves.

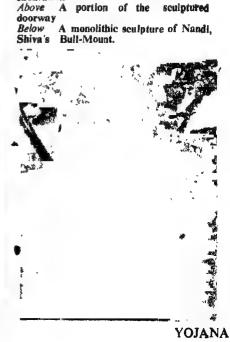
MALINITHAN

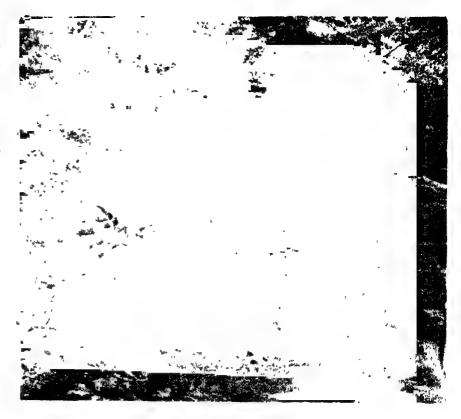
At the southern border of Siang District adjoining Assam, buried in mud and wild foliage, lie the ruins of Malinithan, only recently brought to light by the spade of the archaeologist. Situated barely 1 kilometre of Likabali, the nearest administration centre, the traveller will have little difficulty in reaching the ancient remains.

At a point where the hills descend into the plains, some seven or eight centuries ago, Malinithan flourished in its architectural glory, drawing pilgrims from many places in Assam and Bengal. Possibly, in its prime, the city with its many temples, nestled besides a river, a tributary of the Brhmaputra. Of that river no trace is left.

Like many other places of Hindu pilgrimage, Malinithan is also hallowed by tradition. The romantic legend of Krishna and Rukmini wraps the ruings Its name itself—Malinithan, is derived from this legend of Krishna After eloping with Rukmini, Krishna is believed to have come here with his bride to rest and relax. They visited the local temple dedicated to Shiva and Parvati who blessed the couple

Left An archaeologist clearing the ancient brick wall at Malinithan after excavation
Above A portion of the sculptured doorway
Below A monolithic sculpture of Nandi, Shiva's Bull-Mount.


with a gift of a divine garment or mala, Hence the name Malini and Mainithan -- the abode of Malini.

The excavation of the Malinithan site has been done in several stages and the entire temple a reawith most of its ruins has been cleared More than one hundred carved images of various deities of the Hindu pantheon, besides many beautiful carvings with bird, animal and flower motifs have been excavated and preserved on the site The investigations so far done indicate that there have been an elaborate temple complex at this place with separate shrines for the principal gods like Durga Surya, the sun god, Shiva and Kartikeya A Significant aspect of the ruins is that the temple was entirely built of stone unlike the other archaeological remains elsewhere in Arunachal Pradesh where brick was used for construction Iron dowels have also been found in the ruins excavated elsewhere in the Lohit District at the temple of Tamreshwari This and other evidences seem to prove that culturally the southern parts of Siang and Lohit Districts were a part of Assam


Above **Another view of the stone foundation of the ancient temple on which stands a newly-built temple enshrining the recovered images.**
Below · **Exquisitely sculptured images of Kartikeya and Surya.**

Some of the sculptures, particularly those of Surya, Indra, Ganesh and Kartikeya are remarkable pieces of workmanship In the absence of inscriptions which have been noticed among the ruins, it is difficult to say exactly how old those temples are. In all likelihood, they are not later than 1300 to 1350 A D. Future diggings and research should be able to expand the range of our knowledge in regard to the forgotten pages of Arunachal's ancient history.

BIHAR MARCHES AHEAD
RAPID STRIDES IN PROGRAMMES
BENEFITTING THE WEAKER SECTION

The 20-Point Programme of the Prime Minister Smt. Indira Gandhi and the 5-Point programme of the Youth Leader 'Shri Sanjay Gandhi have quickened and energised the development process in Bihar. With Dr. Jagannath Mishra at the helms of affairs, the State has made rapid strides in the implementation of the programme and people infused with a new hope and confidence look ahead for a still better future.

Salient Features of Bihar's Achievements
Are As follows :

- 2,10,000 acres of surplus land acquired till Nov. 1976.
- 1,00,000 acres of land distributed to landless people
- 17,850 acres of land restored to the Adivasis including Tana Bhagats.
- 7,32,207 parchas of homestead land distributed.
- 21,617 developed house sites allotted.
- Minimum wages at Rs 5/- per day for irrigated areas and Rs. 4.50 per day for non-irrigated areas besides one time meal costing Rs. 1/- fixed.
- amilies of bonded 5¼'43labour freed and steps for their rehabilitation taken
- Under the Special Employment Programme a total number of 740 industrial and training enterprises set up.
- Apprenticeship Scheme benefits 5,880 persons.
- 9583 Controlled Cloth Shops opened employing educated youths and others.
- 2,521 villages electrified with emphasis on Harijan Bustees.
- Book Banks opened in all Universities and prices of exercise books and Test books reduced.
- Irrigation potentional created in 93,000 hectares against the target of 87,000 hectares
- 4.75 lakhs sterlisations done against the target of 3,00,000 operations fixed for 1976-77.
- Under the Dowry Prohibition fact 125 people were arrested and 253 cases instituted during the last wedding season for accepting dowry.
- More than 1 crore trees planted throughout the State.

— Information & Public Relations Department

ON THIS EVENTFUL DAY
IN THE LIFE OF TEAMING
MILLIONS OF INDIA
WHO CONSTITUTE
LARGEST DEMOCRATIC NATION
OF THE WORLD
LET US RIEDICATE OURSELVES
TO THE NATIONAL BUILDING TASK
UNDER THE 20-POINT ECONOMIC
PROGRAMME GIVEN BY
INSPIRING AND DYANAMIC LEADERSHIP
OF PRIME MINISTER
INDIRA GANDHI
AND PLEDGE OURSELVES ANEW
TO REALISE THE GOALS
SET BEFORE US
BY THE NATION

WE HAVE TO OUR CREDIT THE FOLLOWING MAJOR ACHIVEMENTS

** 42,000 FAMILIES OF FARM LABOUR NOW HAVE A HOUSE OF THEIR OWN
** CEILING ON LAND HOLDINGS UNDER WAY
** MORATORIUM ON RURAL INDEBTEDNESS
** MINIMUM WAGES FIXED FOR FARM LABOUR
** EQUAL WAGES FOR MEN AND WOMEN WORKERS

LET US WORK HARD TO MULTIPLY OUR GAINS
TO GUARANTEE
BETTER AND COMFORTABLE LIFE
TO OUR BRETHREN.

Issued by :
Government of Goa, Daman and Diu, Department of Information & Tourism, Panaji - Goa

To the people of Arunachal, wherever they may live and whatever tribe they might belong to, the democratic way of functioning is a part of ancient tradition The Village Council in Arunachal has various names, but notwithstanding the differences in religion or the spoken language of the people they are the repository of well established social usages and sense of justice They have preserved the high moral calibre of the common people and ensured peace and order in the tribal settlements. The introduction of the Panchayati Raj and a popular legislature in recent years has only added a new dimension to the age-old democratic traditions of the people which the government is only too anxious to preserve

PREM KHANDU THUNGON,
Chief Minister of Arunachal Pradesh

Traditional Democratic Institutions in Arunachal Pradesh

TRADITIONAL democratic institutions are an integral part of the socio-cultural heritage of the people of Arunachal Pradesh These institutions have given them a sense of democratic thinking and mature leadership If you visit an interior area, you are likely to see a *Kebang*, a village council, in session, discussing some social problem spiced with flowery rhetorics to prove a point or argue out a case

The people of this far-flung area located along India's North-Eastern border have inherited these traditions of democratic life through generations Lack of modern political education and enlightenment has kept the people of this area ignorant about democratic practices as evolved elsewhere in the country till the dawn of independence But this vast Union Territory is the abode of many tribes who may speak different dialects but who are familiar with democratic practices strongly entrenched in tradition These democratic practices have become institutionalised in the tribal sense of the term and that is how we see the various tribal councils functioning today as they have done for untold centuries all over the territory.

Dr Verrier Elwin says in his book, *Democracy in NEFA*, "All the councils have certain features in common. They all derive their authority from ancient times and the fact that they are the expression of the will and power of the whole people. They are supported not only by social, but also by supernatural sanctions and to give false evidence, for example, may call down the vengeance of the gods as well as excite the scorn of men. Sacrifices are commonly offered to avert supernatural dangers, to implore the divine blessings on the councils' deliberations, and to bring peace between the contending parties All the councils are informal in character and except for the Monpa councils and the Adi *bangos*, which seem to be more highly organised, the conception of regular membership, committees, secretaries and so on has not yet come in. The people composing the councils are the accepted leaders of a village and always include the local priest, whose services are often required, and, of course, the officially appointed headmen who are issued with red coats."

These tribal councils were responsible for ensuring respect for the socio-cultural order and discipline in the life of the communities inhabiting this area And to a considerable extent the councils afforded opportunities to the villagers to develop a sense of democratic spirit and also a sense of initiative and leadership. Those who are inspired with a sense of justice, fellow feeling and dedication were normally accepted as the leaders of the communities and they were closely associated with the councils

These tribal councils are essentially and genuinely democratic bodies as there is popular participation in it and the people in the village attend these councils either for redressal of their grievances or with positive proposals for submission to the council which deliberate at length on matters that are brought before them They are also democratic because they are based on the ideas that are democratic in spirit and function in the democratic way for the general welfare of the people in the villages

We can broadly divide the tribal councils into the following categories as they exist in Arunachal Pradesh. (1) The Monpa Mang Zomsa, (2) The Sherdukpen Jungthang (3) The Aka Melo, (4) The Bugun Council, (5) The Apa Tani Buliang, (6) The Dafla Gindungs,(7) The Kebangs of Siang, (8) The Idu Mishmi Abbala, (9) The Kaman Mishmi Pharai, (10) The Nocte Ngothun, (11) The Wangchu-Wangcha, (12) The Tangsa Councils (13) The Singpho Councils and Khampti Councils.

The continuing existence of all

these councils is testimony to the fact that the social life of the people belonging to the various tribal groups is based on traditional democratic ideals which have provided a strong foundation to the socio-political infrastructure so necessary for the democratic decentralisation as practised now in our national life

It will be relevant to indicate the structural patterns of these councils and their socio-cultural and socio-political implications. For instance, the Monpa Mang Zomsa are the councils which are well developed, self-governing institutions at the village level and have been in existence for the last thousand years From the point of view of power they exercise and the democratic nature of their functioning, this can very favourably compare with the Kebangs as they have been in existence among the Adis of Siang district. According to traditional belief, the immigrants from the plains under the Prince Rapati, came up to Tawang and were responsible for constituting themselves into a noble class almost analogous to a class of aristrocracy and were known as Khyes They long continued to be the ruling community but sometime in the eleventh century the Tawang valley was converted to Buddhism by Terthun Pemalingpa a monk from neighbouring Bhutan. This monk took the initiative to establish the northern Monpa villages and thereby he extended the influence of Buddhism in the area. As a consequence, the socio-political organisation of the Khyes who were once the rulers, crumbled, and village self-governing institutions came on the scene. The tasks that were originally entrusted to the Khyes now come to be confined to protecting the area from invasion from adjoining Tibet or Bhutan. Along with this, an institution called the *Tsobla*, an elective body, came into prominence which was subsequently substituted by local officials called *Tsorgens*. The Tsorgens were in charge of a big village or a small group of hamlets whereas the Tsobla was normally in charge of only small settlements. These Tsorgens and Tsobla, which are the traditional institutions are of great consequence in the life of these people, and they are responsible for all developmental activities being taken up for the welfare of the inhabitants of the village as well as for administering justice when disputes arise between people or communities of villagers. These institutions also contribute to a large extent towards the cultural integrity of the Monpas.

The Idus of Lohit district have an organised village council called Idu Mishmi Abbala

Among the Sherdukpens, another institution called *Sherdukpen Jungthang* has been in existence for many centuries. These councils, constituted of the *thik akhao* (the village headman) the *jung-me-barso* (the ordinary members of the council) a *kachung* or courier, and a chowkidar. These councils were responsible for deciding disputes and also taking up development works like construction of paths, bridges and buildings, fixation of dates for community hunting and fishing and celebration of festivals etc. As a matter of fact, the councils' activities were multifarious and they maintained the prestige and authority of the council in the socio-cultural life of the people.

An Adi Kebang in Siang district

Similarly, the Akas, another prominent tribal group, living in the lower belt of Kameng district have their council called *Aka Melo*. This tribal community is very conscious of the political and social influence of their political organisation. This authority has been vested in a single individual acting as the headman of the village since time immemorial. Even though the authority was vested in the village headman, the whole community could also get the authority to itself and that is precisely why the unity of political

Aka Melo in Kameng district.

organisation in Aka society is the village community as a whole and they normally functioned a as village council

Similarly, among the Buguns (Khowa), a system of political organisation of the village community started with the village as its smallest centre and the village chief as its head. Decision takes the form of public opinion and this public opinion is expressed through the proceedings of the village council and the council is also responsible for the implementation of various developmental schemes as introduced by the Government It is therefore evident that the village chief and the council exercise a political authority over the whole village community and it is somewhat like the Indian village communities where organisation of the village council and the headman exists simultaneously, both exercising a kind of dual influence on the life of the community

In the Apa Tani *Buliang* we find a council of clan representatives who manage affairs of the village These representatives are normally drawn from among the members of the wealthy clans who enjoy status and wealth. The *Buildings* are also responsible for maintenance of peace in the society and for formal treaties of friendship between the individual villages so that no incidents dislocate the normal life of the villagers. Among the Nishis we find the *Dafla Dingdungs*. Although the Nishis are highly individualistic, some sort of council exists among them. These are mostly *Mel* or tribal councils which are attended by the disputing parties in the presence of mediators and spectators They are normally held with the sole object of settling specific disputes but at the same time periodical mels are also held for discussing current affairs.

Likewise the Adis have their Kebangs The Adis of Siang district are rightly proud of their Kebangs and like other tribes, they still like to refer matters of dispute to the Kebang. Traditionally the Adis like to discuss and also to find solutions to any problem through elaborate proceedings and discussions in their Kebang. Important issues are throughly discussed and the final decision taken there is legally binding on all The Kebang is the village institution and has evolved from the deeply felt democratic feelings of the people and their zeal for the consensus. A self-regulating socio-political organisation with a three-tier system of democratic constitution as they are, the Kebangs direct all village activities in accordance with the traditional laws and customs. The Kebang directs and also watches over the welfare and wellbeing of the village community. It is in fact a forum where all matters of common interest are discussed and without its sanction nothing can be done. For instance, opening of agricultural plots, building a new house, roads, punishing the wrong doers and other matters that are of concern to the people in general come to the Kebang for decision. It is also a sort of a judicial body on the pattern of a court of justice. A Kebang has jurisdiction over its own village. Inter-village disputes are settled by the inter-village councils which are known as Bangos. Then again inter village disputes are settled by by a superior body called *bogum bokang* which is a temporary council formed by all the Bangos of the same tribe and is composed of influential elders having no personal interest in the disputes. Among other communities like the Mishmis, Noctes and Wangcho in Lohit and Tirap district respectively village councils with the same socio-political structure are still in existence. These village councils are not merely traditional judical bodies but they are also socio-political and socio-cultural democratic organisations. They have direct influence on the socio-cultural and socio-economic life of the communities.

These village organisations, well organised as they are, have a solid contribution to make towards regulating the life of the villages. It is precisely because of this that the government has always taken care to see that the customary laws of the people are always taken into consideration while deciding judicial cases at the village level or the community level In fact a special provision known as the 'Administration of Justice Regulation, 1945' had to be introduced with the object of ensuring that a vast majority of disputes both civil and criminal, may be settled in accordance with prevailing traditional codes of the tribal communities

These village organisations have been in existence since time immemorial They are the product of organised village life Since they are well organised on the lines of democratic tradition and ideas familiar to us, the modern Panchayati Raj system is not found alien to the traditional socio-cultural and socio-political life of the people of Arunachal Pradesh When the Panchayati Raj regulation was introduced in 1967 in what was then known as NEFA, the system never appeared to conflict with the temperament or traditions of the people. The people by and large responded favourably to the introduction of a new system based on universal adult franchise It is therefore no exaggeration to say that the traditional democratic institutions of the people of Arunachal provided a ready-made socio- political infrastructure on which the present day popular democracy can be sustained. It would be quite in order to say

Rich Literature

A rich and varied literature based on modern scholarship exists on various aspects of life in Arunachal Pradesh, brought out by the Research Department. The Department also published a quarterly bulletin, *Resarun*. Given below is a list of English books published by the Research Department!

The Sherdukpens by R R P Sharma
The Idu Mishmis by T.K M Baruah
Nagaland by Verrier Elwin
The Art of the North-West Frontier of India by Verrier Elwin
The Tangsas by P C Dutta
The Daflas by B K Shukla
Aspects of Padam-Miyong Culture by Sachin Roy
Games of NEFA by Marion Pugh
Nocte Ce by the Philological Section of the Research Deptt
A Philosophy of NEFA by Verrier Elwin
Myths of the North-East Frontier of India by Verrier Elwin
The Gallongs by L R N Srivastava
The Akas by R.P Sinha
A Dictionary of the Taraon Language by the Philological Section
A Phrase Book of Idu by the Philological Section
Democracy in NEFA by Verrier Elwin
Constitutional and Administrative Growth in NEFA by P N Luthra
A Comparative Study of Adi Religion by J.N Chowdhury
Myths of the Shimongs of Upper Siang by T.K Bhattacharjee
A New Book of Tribal Fiction by Verrier Elwin
Moshup Abang by B S Guha
Anthropometry of the Adis by Sachin Roy
The Hill Miris of Subansiri by J.N Chowdhury
Solung, a Festival of the Adis by P C Dutta
Among the Wanchos by L R N Srivastava
Glimpses of the Early History of Arunachal by L N Chakravarty
An Introduction of the Gallong Language by K Das Gupta

Lik-pu-can-han by T.K.M Baruah
A Catalogue of Basketry by A K Das

RACIAL ETHNOLOGY

"The tribes living in the hills of the north-eastern frontiers of Assam represent a separate type with a head shape either wholly or with a tendency to be dolichocephalic, the transverse diameter being narrower, and the occiput protruding somewhat In the flatness of the nose, face, high cheek bones, oblique slit eyes and absence of hair on the face and the body, they are however essentially Mongoloid (the dolichocephalic Mongoloid type), and must be regarded as a different branch of that great race which entered from south-western China, and whose main body moved away towards the Indonesian islands through Burma and the Malay Peninsula leaving a sidestream in the Assam Hills, such as that represented by the Miri, Bodo and the Naga tribes, and underlies the population of the Assam valley in general . .

"It is in all probability likely that they are a branch of that great race which entered from south-western China, and whose main body moved away towards the Indonesian islands through Burma and Malay Peninsula "

B.S. Guha
An Outline of the Racial Ethnology of India

that the Panchayati Raj system has come to play its role in this strategic area and has laid the foundation of democratic decentralisation with direct participation of the local people in the affairs of the local Government as the promulgation of the North East Frontier Agency Panchayati Raj Regulation of 1967 actually laid the foundation of an indigenous representative Government in the Territory The structure has three tiers, namely:—

(a) Anchal Samitis covering the blocks. For this purpose some 39 blocks have been carved which are coterminus with the Community Development Blocks
(b) Zilla Parishad, which will operate at the district level and there will be five of them
(c) The Agency Council at the level of the administration which will sit with the Head of the Administration, namely the Governor, as Chairman.

The implementation of the Panchayati Raj Regulation, 1967 is the first step for democratisation of power and in a sense it provides a landmark in the constitutional evolution of Arunachal Pradesh. This particular step has accelerated the constitutional growth of the area towards the formation of a popular representative Government. Along with this accelerated political growth the area has also witnessed a fast changing administrative pattern resulting in the inauguration of the Union Territory in 1972 which has an obvious impact on the political growth of the region.

The Prime Minister, Smt. Indira Gandhi formally inaugurated the Union Territory on January 21, 1972 and hoped that this major administrative action would accelerate the socio-economic and socio-political growth of this Union Territory As a matter of fact, the years that followed have seen an unprecedented growth resulting in the formation of a popular Government in 1975 with the passing of the Union Territory (Amendment) Act granting a fullfledged Legislature and a Council of Ministers.□

THE vast potential of Arunachal is locked up in its hilly terrain, one of the most difficult in the country to open up. But open up we should because the country stands to benefit from every rupee of investment. This investment has first to be on roads, however, expensive it may seem for the moment. Every development activity here hinges on the transport problem and the planner has to determine priorities on the basis of norms drawn up for the special requirements of an unusually difficult terrain, says

DR. (MRS) INDERJIT KAUR BARTHAKUR

Roads, Key to Development

LIFE IN THE hills is difficult So is the construction of hill roads Their cost is relatively high and the hills do not and cannot support dense populations The hills constitute approximately one-sixth of the country's land area Their economy is both primitive and weak In the absence of roads and any other means of transport in the hills, people draw on the natural fertility of the land for all their needs Inputs are mainly in the form of locally available labour and skills There is heavy dependence on the forests. Production is mainly for the self-sufficiency of the inhabitants. Savings are meagre to nil Marketable surpluses are few and limited to a few areas where road links exist There are no markets worth the name beyond the road heads No large scale industries can operate

In short, in the absence of roads and other transport facilities, in the hills, the economies of the hill areas are condemned to remain backward, under-developed and continue to be poor and non-generative These isolated areas are mainly inhabited by people who have been recognised by the Constitution of the country as poor and under-developed, and scheduled for special assistance and care. Many of these have been classified as Scheduled Tribes. Characteristically the villages in the hills are very small This is an indication of their economic condition, as the sparsely populated hills, unaided by planned development, can support small villages only

Dr (Mrs) Barthakur is Head, Directorate of Economics and Statistics, Government of Arunachal Pradesh.

Potential

Yet, paradoxically, the poor people of the hills possess the promise of rich potential resources The mountains feed perennial water sources which irrigate the lands of the plains The hill streams and rivers have a high hydel power potential. The erstwhile CWPC estimated hydel potential of Arunachal Pradesh alone at 20,000 megawatts The North Eastern Region of the country as a whole has the potential to meet almost half of the total power requirement of the country if fed into a national grid. This could contribute substantially in meeting the power hunger of many States of the country It would provide one of the main resources for hill States or Union Territories which are at present gravely deficient. If it could be harnessed for cheap and simple heating by the application of appropriate technology to remote village conditions, it would also ease the demand on the forests. People in the hills have to keep warm and unless a practical alternative is provided, trees will continue to be cut for firewood with resultant dangers to the ecology

A view of the Serpentine road that links the hills in Arunachal Pradesh

Mineral exploration in most of the hill areas is in its infancy but resources are expected to be plentiful. Many of the foothills have deposits of oil, which are still to be investigated. Forest wealth abounds and under proper management can yield rich dividends. Forests already contribute about Rupees two crores annually to the resources of the young State of Arunachal Pradesh These potentials of the hills have not yet been fully harnessed to the growing needs of our growing population. The intrinsic quality of the hillman, who, unaided, has survived over centuries in the face of natural hazards and calamities is itself a rich human potential. Centuries of traversing steep, narrow and primitive paths, seems to have equipped him with a special equilibrium of mind and a precision uncommon to the people of safer and easier areas This adaptive balance of the hillman could itself be an asset and used with advantage for precision work on electronic goods, watches and other delicate instruments especially as climatic conditions most conducive to such work are also readily available in the hills. The distinctive climate itself is an asset if used to the advantage of man for production of specialist crops including cash crops, capable of earning valuable foreign exchange The hills can provide a variety of attractions to all categories of tourists

All this potential has to be converted into reality The country has recognised this and made promises Our Constitution offers many concessions for the Scheduled Tribes An accelerated development rate is sought to be provided to such areas under the classification of (a) Scheduled Tribes sub-plans (b) Backward area considerations (c) Difficult area benefits (d) Balanced growth principles which focus attention on areas which are behind the beat and rhythm of the country's development (e) International border area development (f) Hill area development

Incidentally, areas which qualify on all the above mentioned special considerations also attract almost all the thrusts of 20 point economic programme. The under-development of these areas is so acute that the "minimum needs programme" of the developed parts of the country constitutes a dream —a far cry and perhaps beyond the "maximum" programmes, capable of implementation through the plan grants. In spite of these special considerations, why do these areas continue to be so comparatively under-developed? What is it that keeps them chained to primitiveness?

When it comes to building roads, the whole village displays the spirt of Shramdan

It is time to delve into the causes and recognise the pivotal center of development which alone can remedy the situation

It has been argued that villages in the hills are small and the population density per sq km so low as to render investment unremunerative But this is a dictate of the environment. High lands offer low returns As things are at present, there are no alternatives, and no savings Many of the modern inputs cannot be applied in such a terrain almost entirely because of the constraints of communications in hill areas unlinked and unfed by roads, or other efficient means of transport

One could count one by one many factors, responsible for low developments in the hills, but the cardinal factor which dominates and influences almost all other discernable causes of low development is the absence of an adequate road network and transport system The hills do not and cannot have other alternative means of transport. The ancient bullock cart (which in the plains carries in its totality a heavier load than the trains), the rickshaws, the 'Thelas', the Railways, trams and river navigation, all of these are hardly relevant in the hills except in limited local pockets Road and ropeways have to carry all loads and traffic in the hills, apart from the minor contribution of pony trains Moreover, the hill roads, because of their winding alignments, have to cover twice the distance of roads in the plains to serve an equal economic need. Therefore, the hills in theory should have twice the road density of the plains to be compared to the road systems in the plains To provide an efficient communication system in the hills especially during transitional development, ropeways and pony services and small air strips may have to be pressed into service to supplement the meagre road network in the hills But whatever we may say and whatever we may plan, nothing will ultimately create general economic viability until an efficient road network opens up the hills to economic ventures. Road specifications also have to be adequate for transport costs to be brought down to a viable level in aid of production and economic movement of goods and services

The Union Minister of Transport and Communications, Shri G.S Dhillon in his speech on 23rd November, 1976 at the Hill Area Development Seminar held at Shillong stated that the hills have only achieved a road density of 14 1 km (1975) for 100 sq km of area as against 36 1 km (1972)for the country as a whole When the density of roads for the country is adjusted with the hill area weightage for 1975, the disparity with the plains areas becomes even greater. The latter should then be projected at 40 km per 100 sq km to achieve a proper comparison As already explained, the corresponding road density for the hills ought to have been double this i.e. over 80 km of road length for 100 sq km of area. However, even

this road density would not have cancelled out the handicap of the inevitable absence of alternative means of transport like the bullock cart, railway etc. Obvious geographical and historical constraints hindered development in the hills and kept the road density as low as 14 km. However, the fact remains that it is unacceptably low, and must be corrected if stagnation and backwardness is not to be perpetuated indefinitely and other developmental efforts rendered infructuous or unremunerative.

Judging from the speed of development in other developed and fast developing regions of the country, it can be said with certainty that the development lag between the hills and the plains will actually widen unless corrective measures are meantime taken to enhance the growth rate in the hills. It is expected that by the end of the Sixth Five Year Plan, the plains are likely to achieve a road density of around 50 km per 100 sq km of area. Comparable to this, the hills ought to have by that date a road density of about 100 km per 100 sq km of area even though a case for a still higher road density could easily be presented.

It must be accepted, that the terrain in the hills is difficult, and road building is costly and takes time. But to catch up with the country's overall advance in the sphere of roads alone, and providing for double its roads density in the hills, very heavy investment would be needed which at this stage will obviously be unavailable. Therefore, road density for the hills may be fixed at a modest target of 30 km per 100 sq km of area. It would, however, be necessary to specify a date to achieve this target. The target of 30 km of road density for 100 sq km of area would be only one-third of the road efficiency of the country in the plains, and it seems essential therefore to specify the end of the Sixth Five Year Plan as a date not too late to achieve the norm of 30 km per 100 sq km.

Once the target and the date is fixed, it would be necessary to identify areawise allocations as per the relative needs and deficiency of each hill territory.

Existing road densities for different hill units differ. In certain hill areas like Arunachal Pradesh, it is as low as 5.6 km for 100 sq km of the area. In the absence of any other means of transport 5.6 km of road for a 100 sq km of areas is totally inadequate. Such infant territories need special care and treatment. Even within each hill area, there will be certain pattern regions which can be permitted initially for coverage in order to boost up coverage in more fertile and densely populated pockets suitable for cash crops or the extraction of other industrial resources.

Even so, and with this limited target of 30 km per 100 sq km of area by the end of Sixth Five Year Plan, a very massive investment would be required. In the case of the most backward area in the country, Arunachal Pradesh, this might work out at over Rs 1000 crore! However impractical this might seem, the fact must be faced that unless over-riding priority in investments under plan schemes in such areas is given to the development of communications (at its formative stage Himachal Pradesh devoted one-third of its total allocations to this sector) all other meaningful development schemes will founder or falter. Deeper thought and time bound programmes to meet the situation are therefore urgently necessary. □

Oil Exploration in Arunachal Pradesh

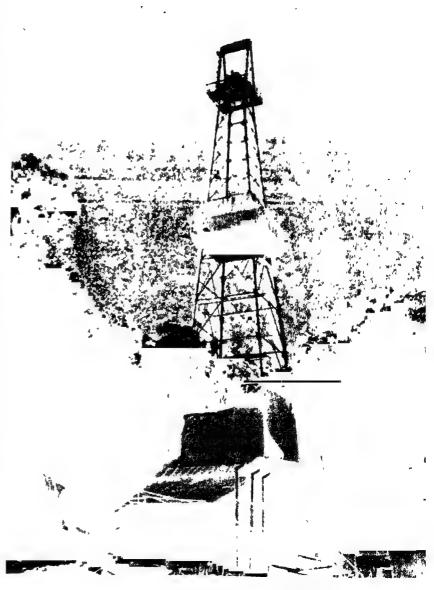
Drilling for oil in Arunachal Pradesh is still in the exploratory stage Though the seismic surveys conducted so far in the Ningru plains have shown the presence of a few structures at depths and the well evidence from drilling so far shows high abnormal formation pressure, the hazards arising from the unusual nature of the terrain and climatic condi tions are numerous and make the effort expen sive Indian technicians have been masterin those difficulties and the future prospects ar dependent on our capacity to invest bot money and skills

THE NINGRU PETROLEUM Exploration Licence (PEL) area of Oil India Limited (OIL) is situated in Arunachal Pradesh in the extreme north-eastern corner of India Out of the total 1541.044 sq kilometres originally granted in 1963, the Company presently retains about 552 sq kilometres, the rest have been relinquished as per the concession rules The area is generally thickly forested, and comprises both plain country criss-crossed by several rivers and streams and with hills rising upto 1000 metres above sea level Some of the rivers in this area are very turbulent, and are susceptible to high floods during the monsoon and unpredictable flash floods at other times

The most prominent geographic features are (a) the NNW-SSE tending Manabum range which lies on the eastern part of the area and (b) the Noa Dihing river which cuts the area diagonally Apart from the Noa Dihing river which is a major drainage feature, there are many hill streams which cannot be crossed at all when in flood Due to its close proximity to the hilly region the Noa Dihing discharges high volume of water at great velocity. The presence of large boulders and floating timbers in the river flow makes it unfordable except for a few dry months during winter

Oil-Bearing Structures

The Ningru area had attracted the attention of explorationists in the past on account of several oil shows in the hilly region lying to the south of the Noa Dihing A few shallow wells were drilled prior to 1940 near the oil shows, but were later abandoned as no hydro-carbon accumulation of commercial interest was discovered.

Based on note received from Oil India Ltd


An oil drilling well in Arunachal Pradesh

After obtaining PEL coverage over the area, OIL reviewed the past evidence and carried out fresh geological and geophysical surveys From the information thus gathered, OIL considered that there could be oil/gas prospects in several types c structures present in the area. Th type of structures could broadly b defined as .

(i) the large Manabum structur delineated mainly on th

basis of surface geological work;

(ii) the fairly big sub-alluvial structure at Kumchai delineated on the basis of seismic data; and

(iii) several small structures in the hilly region to the south of the Noa Dihing indicated by surface geological information and limited amount of seismic data.

While a discovery in any of the large structures has obvious economic attraction, it is also evident that, depending upon the depth of the productive strata, even smaller structures could be attractive, particularly if several of these are found in close proximity. The planning objective was to drill a number of key exploration wells to test these possibilities.

Exploration So Far

While geological and geophysical surveys were carried out on both sides of the Noa Dihing, the first phase of drilling was undertaken on the smaller structures to the south of the river This resulted in a shallow oil discovery in an area of Kharsang. Drilling activities were then extended to the north of Noa Dihing, and the first well on this side is currently drilling on the large Manabum structure.

Geological mapping of the exposed structures in the Ningru area was done earlier. Some of the critical areas were further mapped in detail after the grant of the PEL to OIL A seismic survey was also carried out in the Ningru plains in 1964-65 and a total of 497.287 line km were surveyed. Interpretation of these data showed the presence of a few structures at depths.

The seismic survey carried out in the plains could not be extended to the Manabum hills because of the extremely rugged terrain. A gravity-cum-magnetic survey was carried out over the entire Ningru PEL area during 1972-74 for obtaining sub-surface structural information. A total of 1176 gravity/magnetic stations were covered in these surveys which gave valuable sub-surface structural information.

Four exploratory wells have been so far drilled and the fifth well is being drilled. Three exploratory wells have been abandoned. The information gathered from these wells may be summarised thus:

Area	*Well No.*	*Meterage Drilled*	*Present Status*	*Remarks*
Kharsang	1	2237	Abandoned	Drilling terminated with pipe stuck at bottom after encountering abnormal formation pressure. Presence of oil/gas at shallow depths was proved by testing a few ranges. The well was abandoned since the accumulations were found to be non-commercial.
Kharsang	2	3614	Abandoned	Drilled through over 1500 m of abnormal pressure formations. Tested three ranges below 2885 m. Presence of oil/gas in deeper strata was proved, but the accumulations were found to be non-commercial, and the well abandoned. A few prospective ranges at shallow depths could not be tested owing to operational difficulties
Kharsang	3	1272	Oil well	Several shallow ranges showed indication of presence of oil. One sand range produced oil at the rate of about 60 kilolitres per day.
Shongking	1	1520	Abandoned	Very poor hydrocarbon prospects.
Manabum	1	3829	Drilling	Practically no hydrocarbon indication obtained so far.

FUTURE PLAN OF OIL IN NINGRU

Type of Well	*Structure*	*Well No.*	*Meterage*	*Remarks*
Deep	(Manabum	1	4500	Presently drilling
	(Manabum	2	4500	—
	(Kumchai	1	4200+)	The prospective ranges could be at a greater depth; these wells may have to be deeper.
	(Kumachai	2	4500+)	
Shallow	(Kharsang	4	1500)	Outstep wells to investigate the extent of the shallow oil accumulations discovered in Kharsang 3.
	(Kharsang	5	1500)	
	(Kharsang	6	1500)	
	(Kharsang	7	1500)	

What floods can do to undo what Oil India does

In undertaking this programme of drilling, the transportation of heavy oilfield equipment from Duliajan base to the drilling locations in Ningru PEL posed a major problem. The existing road system in Assam and Arunachal Pradesh (beyond the last rail head at Lekhapani) was found to be totally inadequate. Large sections of forest roads and the timber bridges on two hilly rivers (viz. Namphuk and Namchik) were incpable of withstanding oilfield traffic. The first task before OIL was to upgrade the infra road structure of the region The work was taken up in two phases to synchronise with the projected drilling programme Broadly speaking, the following major civil engineering tasks were undertaken, which are far beyond the scope of the normal activities undertaken in an oilfield and which involved a substantial outlay

Phase I (For drilling on the south side of Noa Dihing).

(i) regrade about 30 km of existing gravelled road,
(ii) improve the cross drainage under the forest roads,
(iii) provide new bridges capable of withstanding heavy oilfield traffic on Namphuk and Namchik rivers, and
(iv) construct long stretches of new approach roads to drilling well sites

Phase II (For drilling on the north side of Noa Dihing):

(i) provide Bailey bridges over three sub-streams of river Noa Dihing to enable the heavy oilfield vehicles to ford the river during winter months,
(ii) provide a 600 m long aerial ropeway across Noa Dihing to facilitate transportation of men and light materials throughout the year, and
(iii) construct long stretches of new roads to drilling well sites in hilly terrain

A view of the ropeway (600 metres) specially built by Oil India to transport men and materials across the river Noa-Dihing during the rainy season.

Future Programme

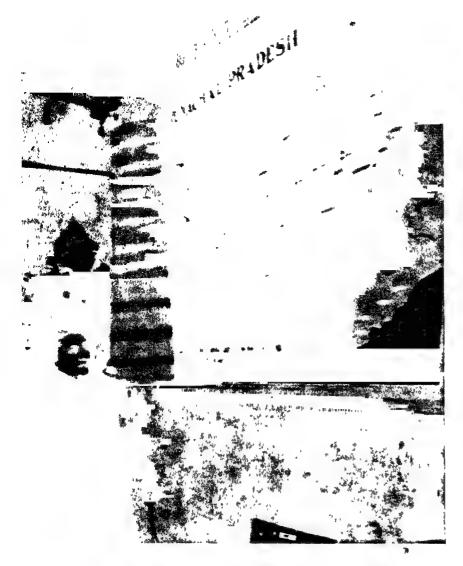
Apart from the discovery of at shallow depths in the Khar structure, the limited amount drilling so far carried out indic considerable geological comple. To resolve these, intensive geol cal/geophysical investigations be required.

OIL is about to procure a hi sophisticated digital equipment seismic surveys. From 1977 wards, it is proposed to carry high resolution seismic surveys pe dically in selected areas of Ningru PEL using the digital cording system. The possib of carrying out a high resolu aeromagnetic survey in the i future is also being looked into

Additionally, the well evide from drilling so far done sh very high abnormal formation p sure with concomitant com drilling problems Under tl circumstances it is difficult to ass a time dimension to the future d ing programme For example, w drilling of a 3100 m deep well Nahorkatiya/Moran areas takes, the average, about four to five we drilling of Khersang 2 (total de 3614 m) took 90 weeks. As a of its future plan, OIL propose drill the following wells in Nin PEL upto 1980 (*See earlier page*)

Ability of Indian Technicians

In the light of the experience ga over the past decade there is e reason to believe that Indian tec cians will be able to successf cope with the several problems exploration that still lie ahead this geologically and topographic difficult area.

The wells listed above are exp ed to provide a reasonable idea ab the hydrocarbon prospects of Ningru PEL. The programme head envisages continuing drill in Ningru till 1980. Further w will have to depend naturally on sults achieved.


The North Eastern Council

Its Scope and Functions

HAVE ALWAYS been interested in hill and tribal peoples and am specially ıwn towards North East India, ;ause of its natural beauty, its ersity and the complex challenges ıt it presents I have sympathy ' Assam, which, although rich culturally, is economically backward because of lack of opportunities

The other political units of this region also suffer from similar backwardness Of course, this is not unique to this region Many parts of the country including a large portion of my own State--the hill areas and the eastern districts of Uttar Pradesh—are also economically undeveloped In addition to the economic and social problems, the North-Eastern Region is important to the country because of its strategic situation The strength and development of this area are of utmost importance to the whole nation

The various political parts of this region are bound by several common characteristics Their people share a variety and picturesqueness of dress and custom that is rarely equalled If they have the good fortune to live in the midst of green and lush surroundings, nature also visis them with many hardships like torrential rains, floods and landslides The very terrain presents formidable obstacles to communication Roads and bridges are needed to connect one point with another and to serve the region as a whole. Rivers remain to be harnessed for common advantage. The resources of the forests and the wealth hidden in the soil must be utilized for the welfare of all.

The primary purpose of this Council is the development of the region for greater human welfare. The first principle of development is coordinated activity. I have no doubt that the different units of this region will gain by such coordinated work Today even sovereign Governments co-operate in matters such as trade, utilization of river systems and water resources for irrigation and power, the building of highways and railways, and the utilization of mineral resources Such co-operation does not in any way lessen the authority of individual Governments.

As the North-Eastern Council is meeting for the first time, I should like to take this opportunity to remove some misconceptions regarding the scope and functioning of this Council This is an organisation of the various political units of this region, set up under an Act of Parliament, to formulate a co-ordinated plan for development and welfare. It is not a super Government It does not abridge the power of the States and the Union Territories in any manner whatsoever It is not an extension of the Union Government It is an advisory and not a supervisory body. It does not alter the relationship of the member units with the Central Government The Central Government will not use the Council to interfere with the affairs and functioning of the various Governments of this region I share the hope expressed by the Governor, Shri B K Nehru that the Council will gradually grow into an effective co-ordinating agency for the solving of regional problems in an atmosphere of goodwill, responsibility and mutual respect.

I should like the Council to draw up projects which will benefit more than one unit and which can be implemented, or at least started within the remaining period of the Fourth Five-Year Plan. There are sectors such as transport and communications, power marketing, institutional financing, training, preparation of feasibility studies for industries etc. in which a regional approach would be most welcome Vision and practicability are the two

Extracts from the speech of Prime Minister Indira Gandhi while inaugurating the North-Eastern Council on November 7, 1972.

Basic Facts About Arunachal Pradesh

Area 84,000 square kilometres.
Total Population 467,000
Male population 251,000
Female population 216,000
Scheduled Caste population 339
Scheduled Tribe population 369,000.
Villages 2,973.
Towns 4.
Density of population 6 per sq km.
Sex ratio (females per 1,000 males) 861
Total workers population 269,000
Cultivators 211,000
Agricultural labourers 5,000
Other workers 53,000
Non-workers 198,000
Administrative subdivisions 26.
Administrative circles 82.
Length of roads 3,331 km.
Post Offices with telegraph facility 21.
Post Offices without telegraph facility 84.
Electricity installed capacity 2,427 kW.
Places electrified 65
District Hospitals 7.
Dispensaries & Health Units 87
Medical Teams 20.
TB Hospital 1.
HD Sanatorium 4
Ayurvedic Dispensaries 1
Number of doctors 158
Nursing staff 31
Auxiliary nurses 101
General beds in hospitals 778
TB beds 182
Hansen disease beds 272
Literacy 11.29 per cent
General educational institutions 751
College 1
Higher secondary schools 25
Middle schools 88
Junior Basic/Primary schools 622
Pre-primary schools 15
Number of students 43,000
Technical training institutions 4
Land developed under permanent cultivation 2,637 hectare
Agricultural farms 10
Horticultural nurseries 278
Area irrigated by channels 5,831 hectares
Area irrigated by other sources 300 hectares
Villages provided with water supply 818
Cattle farms 8
Goat farms 2
Veterinary aid centres 47
Veterinary dispensaries 51
Mobile vet dispensaries 5
Fodder farms 5
Fish farms 29
Village fish ponds 1,956
Area under pisciculture 134 hectares
Total area under forests 51,540 sq km
Reserved forests 7,260 sq km.
Unclassed or undemarcated forests 44,280 sq km.
Forest revenue in 1974-75 Rs 17,044,000
Legislative Assembly 1
Zilla Parishad 5
Anchal Samitis 44
Gram Panchayats 623
Community Development Blocks 43
Cooperative societies 110
Craft centres 19
Annual outturn of craft centres Rs 1,192,000
Sericulture demonstration centres 12
Weaving units 12
Medium industries 1
Village and small scale indusries 63
Rural industries project 2
Community radio listening sets 1,491
Number of bank branches 9
Bank deposits during 1974-75 Rs 13,672,000
Bank advances in 1974-75 Rs 1,227,000
Social and cultural organisations 47
Books in libraries 100,000
Total number of government employees 12,137
Budget estimate for 1976-77 Rs 305,800,000.

Source · Directorate of Economics and Statistics, Government of Arunachal Pradesh.

key tests of good planning. I should like to assure you that the suggestions made by the Council and the projects drawn up by it will be considered with particular attention by the Planning Commission and also the various Ministries of the Government of India

You will be glad to learn that the Government of India can make available to this Council a sum upto Rs. 50 crores during the remaining period of the Fourth Plan for such regional projects as it might draw up. These funds will be over and above the funds that the States and Union Territories will receive under their own Plans.

Such special allocation for the development of this special region will also continue in the Fifth Five-Year Plan.

The implementation of these projects and schemes will be the charge of the respective Governments and their agencies. This might entail the strengthening of their existing administrative and executive machinery. It is important that each of the North Eastern States builds up expertise in the matter of data collection, project preparation and construction and administration.

Forestry In Arunachal Pradesh

E. S. THANGAM

A bout eighty per cent of the State revenue in Arunachal Pradesh comes from its rich forests which cover sixtytwo r cent of the total area. The divergence altitudinal and climatic conditions has oduced a wide variety of trees and floral alth ranging from the tropical rain to the pine species, not to mention important rest products like the bamboo and the ne and a wide range of medicinal plants cause of its difficult terrain, heavy rainfall d its innumerable rivers which get flood during the rainy season, paucity of transport facilities poses a serious problem not only to forestry development but also to the exploitation of its mineral and agricultural resources. The Government's strategy is to develop the forest wealth so as to preserve the ecology of the area and exploit potential resources in a planned and scientific manner

Mr Thangam, the Chief Conservator of Forests, Arunachal Pradesh, presents below an overall picture of the forest resources and efforts being made to exploit them

FORESTRY HAS a major role to play in Arunachal Pradesh unlike other states, nly because it is a hill state re most of the people still cone to live in the forests Being nly of tribal origin, these people not seen much of civilisation continue to live in their own itional ways due to lack of conwith outsiders. As a result, the sts continue to be the warp woof of their life-web for generas. Century after century, they been living like this and even modern atomic age has not been to make any perceptible dent in r activities.

runachal Pradesh is the largest in the North-Eastern Region of country It lies between 26° 30' 29°.28' North latitudes and 5' and 97°.24' East longitudes. five administrative districts Kameng, Subansiri, Siang, it and Tirap covering a total of 83,578 sq. km. are located ely in hilly and mountainous in and enclose the Brahmaputra ey like a broken horse-shoe. the northern and eastern sides, uches the international boundaof China and Burma, on the h it borders Assam and Nagaand on the extreme west, tan. The population is barely lakh (1971 census) consisting ly of local tribal people.

ut of the total geographical area 83,578 sq. km. the Reserved Forests occupy 7,257 sq km. (9%) only and the village forests occupy 44,284 sq. km (53%)

The annual rainfall varies from 1000mm. to 6500 mm and the humidity, even during winter months is high The altitudinal variation ranges from 170 m to 8000 m, rising from the banks of the Brahmaputra river to the snowy Himalayan peaks. These have given rise to such divergence of climatic conditions that we find a wide spectrum of vegetation ranging from the tropical to the alpine types.

Because of its rich and varied altitudinal and climatic conditions, several of the forest types of our country viz the tropical rain forests, the semi-evergreen forests, the subtropical forests, the temperate forests the sub-alpine forests and the alpine forests occur. The important timber species that occur in the lower elevations are hollock, hollong, mekai, bola, khokon, nahar, duna, chaplash and champak. In the higher altitudes, blue pine, fir and other pines occur with oaks and other species Among the minor forest produce, bamboos and canes are important. Certain medicinal plants like coptis teeta are also collected.

At present there are four plywood mills, one at Namsai, another at Jairampur and two more at Deomali. There are about six saw mills in the State.

A great diversity in wildlife is found in this State due to dense vegetation, abundance of fodder and fruit plants and a wide range of climatic and geographical conditions. The inner-line restrictinos have also helped to protect the wild life Mishmi takin, red panda, snow leopard, clouded leopard, elephant, hoolock, sloth bear, Himalayan bear, wild buffalo, gaur, sambhar, swamp deer, musk deer and barking deer are seen. A wide variety of birds including the hornbills, magpies, orioles, king-fisher, pheasants, partridges and quails are seen. The rivers and streams abound with several kinds of fish.

Constraints on Development

In the execution of the developmental activities in Arunachal Pradesh, several difficulties have to be faced. While formulating the developmental activities, the local factors like special geographical features, the natural resources and the bottlenecks in their development need consideration The important among the special geographical features are the occurrence of international borders, difficult and hilly terrain, its many rivers and streams, the heavy rainfall, the varied climatic conditions including humidity and dampness and the corridor entry to meet the rest of the country. The natural resource potential of the state is high particularly with regard to oil, gas, hydel and thermal power potential, mineral and metal resources, water resources for navi-

gational and agricultural purposes.

In addition, the climatic and soil suitability for important cash crops like coffee, tea etc. and forest resources of timber for wood-based industries, livestock and fish resources of the State are to be mentioned. The constraints are trasport difficulties mainly due to difficult terrain, heavy rainfall, large number of rivers and streams which cause floods and which make development of roads and transport facilities a difficult and costly proposition. Further, low density of population with low investment per unit area and lack of area development due to these are to be reckoned with. Moreover, to harness the rich natural resource potential, the government investment has to be quite high. As a result, almost the entire development of mineral, oil and gas has remained in the investigation stage only.

The forests are still the only appreciable natural resource which earns considerable revenue in Arunachal Pradesh and they play an important role in the economy of the state. During the last three years ending 1975-76, the Forest Department has earned an average of Rs 18 3 million which is nearly 80% of the total state revenue.

Development Programmes

While the reserve forest occupy only 9% of the total geographical area, the village forests occupy 53% of the geographical area. In view of this, our future development strategy has to aim at not only the development of the Reserve Forests under the control of the department but also the village forests which remain with the villagers. This is all the more necessary in view of the fact the environmental factors are modified by the different variables involved in the environment as a whole, be they in our outside the Reserved Forests. The development activities taken up in the Reserved Forests and Village Forests will be described below.

(a) *Reserved Forests* : Like the rest of our country, plan schemes to develop the forests were framed from the First Five Year Plan onwards. Till now 14,138 hectares of plantations have been raised under artificial regeneration, 8,884 hectares of plantations have been raised under natural regeneration besides ending 886 hectares of forest plantations. Medical plants and spices have been raised in 200 hectares. Survey and demarcation of forest boundaries has been done in 1,500 sq. km of forest area. Other schemes taken up are a Working Plan & Resources Survey, Forest Research, Wildlife & Publicity, growing orchids and afforestation works. Annually about 1.9 lakh Cum-timber has been extracted by laying out 1,114 km. of forest roads. As amenities to the forest labour, 856 no of buildings have been constructed. Avenue trees have been raised over 250 km. length of road.

The details of financial target and achievement since the First Five Year Plan for forest development may be of interest :

	Target	*Achievement*
	(In lakhs	*of Rs)*
First Plan	26.17	23.15
Second Plan	34 02	32 20
Third Plan	42.80	51.01
Fourth Plan	67.57	42.99
Fifth Plan	160.00	158 06
(1974-75 & 75-76)	78.62	71.32
(1976-77 to 78-79)	240 00	—

The National Commission on Agriculture in their interim report on "Production Forestry Man-made forests", (1972) recommended that since the State Forest Departments do not generally have adequate finance to take up large scale forestry development activities, the State Forest Departments should resort to institutional finance for developing their forests. Accordingly, it is proposed to form a Forest Corporation to take up intensified timber extraction and plantation activities which would not only help to tap the interior forest areas by laying out more roads and other communication facilities but also help to raise large-scale cash crop plantations like rubber, coffee, spices etc.

The Forest Corporation will also help to market the various minor forest produce including medicinal plants collected by the local people so that exploitation by middlemen can be eliminated. This will ensure a reasonable return to the people, payment of minimum wages to them and increase employment opportunities among the people. These measures will help implement Prime Minister's 20-point Programme.

Village Forests: In the development of the village forests, the main problem is one of eliminating shifting cultivation which has been going on for generations. The local people have been practising shifting cultivation for the past several centuries and so they are reluctant to part with the forest areas for any developmental activities and want to continue the shifting cultivation. Unless this baneful practice of shifting cultivation is controlled, regulated and contained, it will not be possible to effect any substantial change in the economy of the people of this region. It is needless to emphasise that it is the shifting cultivation which to a large extent is responsible for the heavy floods which result in severe erosion and landslides. In our efforts to control the shifting cultivation, we have to secure the willing and voluntary co-operation of the people to subject their lands to the new agri-silvicultural practices. Further, the management plans will have to be a composite package plan of forestry, agriculture and animal husbandry disciplines covering not only the lands handed over to the forest department but also portions of land kept by them for their use, taking each catchment area as a unit of management.

The past efforts of the Forest Departments in the management of 147 sq km. of Namsang and Borduria forests in Tirap district owned by the tribal chiefs taken on lease for a period of 50 years through an agreement has been successful. By a trust deed executed in 1960, major portion of the profit obtained by the management of the forests was remitted to a People's Trust Fund operated jointly by the General Administration and Forest Departments. This trust fund has been very usefully spent for the social welfare activities of the local people particularly for educating them on modern lines by starting a residential boys school at Deomali for about 300 boys in an estate of 250 acres by entering into an agreement with Ramakrishna Mission authorities, Calcutta. In the same way, a girls school and hostel for 30 girls at Khonsa was started by Ramakrishna Sarada Mission authorities in 1973. A cooperative unit for production of tea-chest was started with a share capital of Rs 10 lakhs contributed by 4,000 Nocte Tribal people in 1972. This unit under the management of Forest Department has diversified its activities by installing a saw mill and an oil mill for producing mustard oil. The Forest Department, through scientific management of these forests, has been paying about Rs. 25 lakh annually on an average during the

last five years to the Peoples' Trust Fund.

The successful management of the Namsang Borduria Forests by the Forest Department has produced a far-reaching effect on the people. It has provided the necessary motivation in the people against destruction of Forests through the proposal which has now emerged under the nomenclature, Anchal Forests The creation of Anchal Forests has given the people a sense of participation in the preservation and protection of forests which would bring them handsome revenues and also provide a basis for forest-based industries. This thinking among the people was quickly translated into passing the necessary legislative measure for the purpose. As soon as the popular ministry was formed in 1975 The Arunachal Pradesh Anchal Reserve Forests (Constitution and Maintenance) Act, 1975 was passed. It is interesting to note that this is the first bill to be passed by the popular Government, of the local people after they assumed power in August '75. According to this Act, economically viable forest areas could be handed over by the Anchal Samities for management by the Forest Department which would raise the tree plantations and other cash crops suitable to the locality. The net profits in the venture will be shared equally by the Forest Department and Anchal Samiti which, in turn, will spend the amount on social and welfare activities of the people in the Anchal as well as other Anchals in the Zilla.

The Anchal Samities in the various districts have already placed certain forest areas for management as Anchal Forests and the works have been started during 1976 itself. It is expected that more and more Anchal Samities will come forward to place forest areas for management as Anchal Forests.

Full advantage will also be taken of the centrally sponsored schemes to plant up degraded forests and to raise mixed plantations in village waste lands and panchayat lands. The Forest department has also taken up forestry extension works to plant up canal banks and roadside avenues.

Through successful management of the Anchal Forests, it will be possible to bring large areas of village forests under scientific management and the net revenue that accrues can be spent for the welfare activities of the people. In Arunachal Pradesh this Anchal Scheme will be the main plank of forest development strategy of the village forests and it is expected that successful management of the Anchal Forests will be able to convince the local people of the economics of scale involved in following permanent cultivation methods and will also serve as a nucleus to propagate the modern methods of intensive cash crop cultivation rather than extensive cultivation under jhooming methods □

I came in touch with the tribal people of the North-East Frontier of India, more especially of the Hill District of Assam. My liking for them grew and with it came respect. I had no sensation of superiority over them. My ideas were not clear at all, but I felt that we should avoid two extreme courses: one was to treat them as anthropological specimens for study and the other was to allow them to be engulfed by the masses of Indian humanity.

Jawaharlal Nehru

PARUL DUTTA

THE PEOPLE

Their Socio-Cultural Life

A Mishmi Couple from Lohit District

THE 83,500 sq km of land, along the southern slopes of the eastern Himalayas to the western slopes of the Patkoi Hills around the Brahmaputra valley that has emerged as a new state with the name of Arunachal Pradesh is the home of some twentynine major tribes, with a population of 3.7 lakhs. The various tribes composing this population are: Monpa, Sherdukpen Aka, Khawa, Miji, Bangni and Solung of Kameng District, Nishi, Apatani, Hill-Miri, Tagin, Solung and Mikir of Subansiri District, Adi, Memba, Khawa and Mishing of Siang District, Mishmi, Khampti, Singpho, Khamjang, Miri, Padam, Tibetan and Chakmas of Lohit District, and Nocte, Wancho, Tangsa, Singpho and Lichu of Tirap District.

Somê of these major groups are further divided into sub-tribes mainly on the basis of differences in their dialects. Racially the tribes are Indo-Mongoloid Somatomatric study shows brachy cephalic element among the Monpas and dolicocephalic among other tribes Monpas are a simple, gentle and courteous people. They are friendly and possess a rich heritage of culture They dress well in artistically designed clothes. Their communal life is rich and happy. They follow Buddhist religion and belong to the Mahayana cult. Each house has a small chapel attached to it.

The Sherdukpens are a small tribe They are good agriculturists but their main interest is trade. They resemble the Monpas in many ways. Their religion is an interesting blend of Buddhism and tribal magico-religious beliefs.

A young wancho from Longding, Tirap District

The Mijis are also a small tribe numbering nearly 5000. Their tradition says that they were originally settled in the plains of Assam. They have also come under the influence of Buddhism though they are not Buddhists, strictly speaking.

The Sulungs are considered to be one of the oldest tribes in this area. They dress like the Nishis. Their religion is a form of the primitive—spirit culture.

The Akas have a custom of painting their faces with black marks. They figured frequently in old historical records. They believe that they were related to the Ahom Kings. They are keen traders and trade mainly in cloth, blankets, swords etc. They have come to some extent under both Hindu and Buddhist influence.

The Apa Tanis are settled agriculturists inhabiting the valley around Ziro—the district headquarters. The men-folk tie the hair in top-knots and tattoo the face. Wearing circular nose plugs is the characteristic ornamentation of Apa Tani women. The Apa Tanis are good cultivators and practise both wet and terrace cultivation. Unlike other tribes of Arunachal their economy is stable.

The Tagins inhabit the northern part of Subansiri District. Their main occupation is agriculture. Polygamy is customary among them. Their dress is very simple consisting of only one piece of cloth.

The Nishis (formerly called Daflas) are divided into several exogamous clans. Their economy is self-sufficient and for this reason they depend mainly on the Apa Tanis. Nishi men keep their hair long and tie it in a knot just above the forehead. They wear cane bands around the waist. They believe that after death the spirit of the dead travels to the "villages of the ancestors".

The Hill Miris inhabit the lower Kamla valley. They were given three names — the Panibotia, the Tarbotia, and the Sarakdwar Miris. They have had intimate contacts with the plains of Assam since long past. They look attractive in their dress. They also tie the hair in knots above the forehead. The Hill Miri women wear an attractive "crinoline of cane rings" which serve the purpose of a blouse.

The Adis have two main divisions—the Bogums and the Bomisand. Under each there are a number of sub-tribes such as Minyongs, Karkos, Shimongs, Bomdo Janbos, Panggis, Pailibos, Bogums, Padams, Milangs and so on. The Gallongs are another group of Adis divided into about seven sub-tribes.

The Adis by nature are democratic and have a unique sense of history. They have well organised village councils called *Kebangs*. Their traditional dance, called Ponung, is famous in the whole of Arunachal Pradesh. Dances are very popular among them.

Adi villages are situated generally on the spurs of hills. Polyandry is unknown but polygamy is practised. Adi women are very good weavers and weave cloth with highly artistic designs.

Khampas and Membas inhabiting northern Siang are Buddhist by religion. They resemble a great deal the Monpas of Kameng district. Polyandry is prevalent among them. But it is more in vogue among the Membas. Agriculture is their main occupation. Millet and Maize are their staple food. They grow cotton and barley also.

A Nishi father with his daughter, standing in front of his bamboo cottage built on stilts.

Mishmis form the bulk of the population of Lohit District There are also the Khamptis, the Singphos and a few Adi settlements. The Mishmis are divided into three main groups—namely Idus, Digarus and Mijus. The Idus are also called Chulikatas, the Mijus—Kaman and the Digarus—Taraons. A section of the Idu Mishmis are also called Bebejia Mishmi. Their women are expert weavers and make excellent coats and blouses. Agriculture is the main occupation of the people. By nature they are traders. Since very early days the Mishmis had trade relations with the plains of Assam. The chief items of trade are deer musk, wild medicinal plants, animal skins, Mishmi-tita, etc.

The Khamptis live to the south of the district. They are believed to have migrated from the Shan states of Burma. They are the only tribe in Arunachal who have a script of their own They are Buddhist by religion, and bury their dead in a coffin.

The Singphos represent a section of the Kachin tribe of Burma. They live on the banks of Tengapani and Noa Dehing rivers They are agriculturists and expert blacksmiths The ladies are also good weavers. They follow Buddhism but at the same time believe in a host of spirits.

The Wanchos inhabit the western part of Tirap District, bordering Nagaland They are a carefree, cheerful but hardworking people. Head hunting was customary with them in the old days It was connected with many of the social activities of the tribe Their society is divided into four classes: the Wanghams (chiefs), the Mangpans, the Wangaus and Wangsas. They have a strict sense of discipline and the law and order of the society is maintained by a village council. The entire tribe is divided into about forty confederacies of villages. Tattooing is a social custom among them. They believe in the existence of two powerful deities, Rang and Baurang. The women are good weavers but the art is restricted to the members of the chiefs' families only. They are experts in wood carving also.

A farmer from Daporijo, Subansiri District. The heavy overcoat he wears is made of vegetable fibre

Children from Dirang village, Kameng District

The Noctes inhabit the central part of Tirap to the east of the Wanchos. They are organised under powerful chiefs—those of Nam sang and Borduria. They profess Vaishnavism and are disciples of the Bareghar Satra of Nazira. Naga Narottam who was a close friend of Shri Ram Dev Ata, the founder—*satradhikar* of the Bareghar *Satra*, became his first disciple. Noctes are famous as salt-producers and salt is their chief item of trade and barter. They are also agriculturists, and cultivate betel leaves on a commercial scale.

The Tangsas live to the east of the Noctes—right upto the Burma border Tangsa is a common name given to a group of sub-tribes, such as Lungchang, Moklums, Yogli, Lungri Havi, Mosangs, Tikhak, Ponthai, Longphi and so on. They have migrated from Burma and many of their kinsmen are still there on the other side of the Patkoi Range. Their dress is similar to that of the Burmese. They believe in a number of spirits. Tangsa women are good at weaving.

Agriculture is the mainstay of the people of Arunachal. The system of cultivation is mainly Jhooming—with the exception of the Apa Tanis

who depend on wet rice cultivation. Terrace cultivation and wet rice cultivation have now been introduced among the other tribes also. Rice is the staple food though millet and maize are also eaten by some.

All the people have a tradition of artistic cr.ftsmanship which manifests itself hrough the various products they produce. A wide variety of crafts which include weaving, painting, pottery, smithy, bamboo and cane-work, wood carving and basketry—are found among the people of Arunachal.

They have rich heritage of arts and crafts and the Government is making all round efforts to help develop these traditional crafts.

The society of the people of Arunachal are patriarchal and primogeniture is the fundamental law of inheritance though variations are not very uncommon. They follow endogamy and strictly observe the rule of clan exogamy. Polygamy has social sanction and is practised by most of them.

An Adi, with his brass pipe. They use local variety of tobacco in Arunachal Pradesh

The social life of the people of Arunachal is highly democratic. Each tribe has its own organised institutions called by various names, such as *Kebang* of the Adis, *Ngongthun* of the Noctes, *Jong* of the Sherdukpens, *Mele* of the Akas. *Buliang* of the Apatanis, *Wancho-Wanges* of the Wanchos and so on. These organisations maintain law and order, decide disputes, take up all activities for the welfare of the tribes and the villages. The members constituting these organisations are selected by the people

The whole population of Arunachal may be broadly divided into three cultural groups on their socio-politico-Religious affinities. The first group of tribes profess Buddhism. They are the Monpas, Sherdukpens, Membas, Khambas, Khamptis and Singphos. The second group consists of tribes like the Aka, Khowa, Miji, Bangni, Solung, Dafla, Apatani, Hill-Miri, Tagin, Adi, Mishmi, Tangsa etc. These tribes practise a sort of religion which may be called as magico-religious beliefs and practices. In the third group the Wanchos and the Noctes are included because of heir association with the cult of thead-hunting The Noctes of this group are disciples of the Bareghar Satra of Nazira and hence they are Vaisnavaite by religion

There are a few other tribes who also practise Vaishnavism as their religion namely the Akas, Nishi and the Mikirs The Akas are the disciples of Nikamul *Satra* of Tezpur while the Nishi are disciples of Gharmara *Satra* of North Lakhimpur

Women husking paddy. village Daporijo

The political organization of the first and the second group of tribes centres round the village councils except the Nishi and the Idus. The third group of tribes have strong chieftains as their political head.

On the basis of the material culture the whole Territory can again be divided into three cultural areas. In the first group Monpas, Sherdukpens, Membas and Khambas can be included These tribes practise terrace rice-cultivation and their domesticated animal consists of pony, yak, sheep etc. They build their house out of stone and wood. Their dress and costumes are mainly made from wool

The second group consists of a large number of tribes from Eastern Kameng and whole of Subansiri, Siang, Lohit and Tirap. The main feature of their material Culture is shifting cultivation and hunting except the Apatanis who practise mainly wet rice cultivation.

They live in pile-dwellings made of bamboo and leaves. Their costumes are made of cotton. Their different items of dress are made from natural fibres locally available and cotton.

The third group is composed of the Khamtis and the Singphos. They practise set-rice cultivation. Their domesticated animals are Buffalo and Elephant.

The population of Arunachal is not a homogenous group though racially they have been included within the broad family of Indo-Mongoloid. Analysing the cultural traits of the people we find that the patterns of culture as obtain in Arunachal Pradesh can be discussed within the framework of two main groups—the Bodic and the non-Bodic.

Among the Bodic group we find the use of stone and wood for their

An old Adi lady of Siang District

house and furniture, wool for their dress, which is tailored and woollen felt cap as head-dress. Their ornaments are made of beads and silver. The food consists mainly of maize and barley with butter. Their arts and crafts are made of wood and work. Wood carving and painting, is a peculiarity of the Bodic group. Dance is very popular among them. They have different musical instruments of their own and also of the Tibetan type among those who live in the north. Their religion is sophisticated and they have temples, images, sacred literature and well-organised priesthood.

The non-Bodic group on the other hand use cane and bamboo for their house and furniture, nettle fibre and to a less extent cotton for their dress with [illegible]tailoring. They wear cane [illegible]ies, goat's hair, gl[illegible] beads in [illegible]es and

An [illegible] mother with her child. The [illegible] have tattoo marks and distinctive [illegible] decoration both of which are being given up by the younger generation.

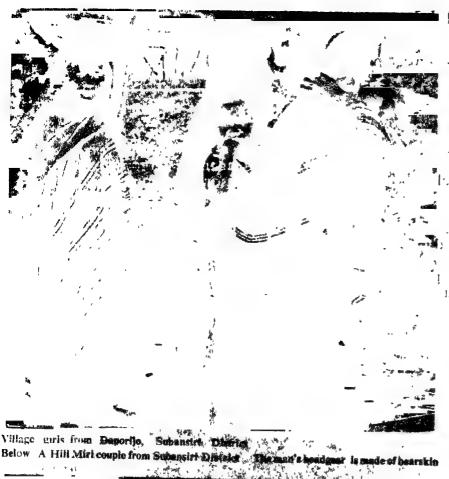
silver coins for ornaments. Bamboo nose plug is a characteristic of Apatani women. They crop their hair (semi or full) and tie it into a nape knot as among the Daflas, Apatanis and Hill Miris. Their food consists mainly of rice and millet. They are expert in cane and bamboo work and to some extent blacksmithy. Their dance is generally religious. Musical instruments are very rare among them and may consist of only the gong, drum and logdrum. Jew's harp is also common. The existence of the dormitory system among Noctes, Wanchos and Padam-Minyong is another characteristic feature. Non-Bodic religion is based on faith in spirits and deities with oral sacred literature, but without organised priesthood and centralised places of worship.

Besides the distinguishing characters of the two main groups, the tribes of Arunachal were integrated groups independent of each other and living their lives separately. The only relation between them was that of:

(a) (i) barter trade in which individuals of each society and not the groups acted as units.

(ii) frequent feuds—arising out of infringement of political and economic rights in which the

Village girls from Daporijo, Subansiri District

Below A Hill Miri couple from Subansiri District. The man's headgear is made of bearskin


groups acted as units but for a few exceptions. One such exception where the units were individual families or clans was reported to be the Apatanis of the Subansiri District.

(b) Society was governed either by chiefs as in the case of Wanchos, and Noctes or by village elders as in the case of the Adis notably. In tribes where individualism was the predominant character as in the case of the Idus and Daflas, there was no particular machinery and in such cases it was the family and the clan which handled issues when they came to head in the form of vendetta.

(c) The societies were casteless but had classes such as chiefs, artistocrats and commoners, slaves, freeman etc.

(d) The pattern of life was uniform, each individual lived in the same way and followed the same occupation. Disparity in economic status was hardly noticeable though the better off and the worse off were not unknown.

(e) Patriarchy is the form of society with primogeniture as the fundamental law for inheritance. Monogamy is the basic rule within the framework of clan exogamy and group endogamy.

(f) The main occupation is agriculture with crafts such as weaving and basketry as subsidiary ones. All productive activities were on the consumption level, each family meeting its own demand. Women were the main producers both in field and at home (except in basketry) and the maintainers of the family. Control of the society, maintenance of law and order and settlement of inter-tribe affairs were masculine functions.

(g) Ethical code was of single standard and written law was not necessary. Association of individuals within the society was compulsory. Individual preference or choice was not permitted in associations. All had to conform to the pattern in vogue. □

JHOOMING AND
TS CONSEQUENCES

DR. MRS. BARTHAKUR

Nearly seven per cent of India's populati-
ı belong to Scheduled Tribes and practically
e entire territory of Arunachal Pradesh is
habited by them. In spite of their rich tra-
tions of culture most of them are economi-
ly backward because agriculture which is
eir main stay is primitive and allows little
plus. The most characteristic agricultural
ictice of the tribal people living particularly
he hill areas is what is known as jhooming which consists of clearing a forest on a hil slope and burning the undergrowth to prepare the land for seasonal agriculture. This has, for centuries, resulted in the denudation of forest areas and brought about tragic erosion of soil which cannot be replaced

In this article Dr Mrs. Barthakur examines this destructive agricultural practice and its impact on the land and people of Arunachal Pradesh

This is a partial view of the Apa Tani Plateau, inhabited by the Apa Tanis who are known to practice settled agriculture for generations. Even so, the hills in the background, now practically bare of trees, show evidence of jhooming. It will take many decades for trees to grow again here after all the erosion that has taken place,

WHATEVER BE THE subsidiary occupation of the Scheduled Tribes population, agriculture continues to engulf the entire life style of the Scheduled Tribes. In the class room of their agriculture, they have learnt the way of their life. Their social behaviour, their life pattern, social ceremonies and almost their entire economic life revolves round agriculture. To bring about a major change in their standards of living, it would require a major thrust into their agricultural practices and persuits in an integrated manner.

In order to do this, it is necessary to understand what their agricultural practices are: and why—over the centuries they have not changed to better methods, and what is required to be done to change these to something more profitable.

The most predominant agricultural practice followed by most of the Scheduled Tribes, is the swidden type of cultivation, popularly known as the 'Slash and Burn' cultivation. Let us examine this practice in depth because it continues to predominate India's hilly terrain. The technology used in this type of cultivation, though primitive, does give a few definite and real advantages to the cultivators, because of which it has continued so long On the other hand, the disadvantages are not immediately visible to the farmers excepting in areas where sudden and unnatural population increase and other compulsions have created laboratory conditions.

The Swidden Cultivation

Under the swidden (Jhooming) cultivation, every year thousands of hectares of forests are cut, burnt and planted in successive cycles. Usually a group of households or an entire village selects a suitable plot for swidden cultivation. At the time of selection of the plot, a number of factors are taken into consideration. The growth of the vegetation has to be sufficient to provide enough ashes, the soil must be of particular depth and colour to guarantee minimum fertility. Nearness to a water source, to the farmers, residence and the land free of certain types of pests and animals, the availability of sunshine etc are some of the other considerations. Many tribes, however, invoke blessings and divine favours through omens with the help of a haruspex before the site is finally selected for the slash and burn type of cultivation. The vegetative growth is cut and for a certain number of days the cut jungle is allowed to be dried before it is fired. The method is basically of cultivating the hilly tracts without terracing and without modern technology and inputs. The ash derived from burning is the only form of manure applied to the land. After cultivating the plot for a season or two, depending upon the land's fertility, it is allowed to lie fallow for a number of years, depending upon the generative capacity of the land. The swidden cultivator moves to the next plot of land. He may return to the same plot after a few years. A number of patches of land are thus locked under the Jhoom cycle. All these by turn are cultivated and exposed to the soil erosion forces. He introduces no inputs excepting his labour and seeds, and exploits the land of its natural fertility.

A view of terraced farm with hills clothed in dense jungles. A hill stream supplies water for irrigation

Advantages of Swidden Cultivation

The Jhoom fires quickly render a dense forest fit for growing crops Fire is thus a great labour saving device and clears the cut jungle in a very short time. The ashes correct the soil acidity, and the admixture of ashes with the soil makes the soil more fertile. The soils of hill slopes of high rain zones are generally acidic, which are thus partly neutralised by the alkali content of the ashes. Further, fire clears the area of extensive preponderance of fungi, insects and pests. Not only the insects and pests of the Jhoom plots with their larva and eggs are burnt but the Jhoom fires which are usually lit at night and continued for a few days, attract insects and pests from the surrounding forests. This rids the area of these pests which later would have destroyed the crops. The clearance of insects and pests from the surrounding area to the Jhoom plot creates a protective belt and keeps the crops safe from the heavy inroads of insects and pests. In many parts of the country it has been seen that stoppage of Jhoom fire has led to enormous increase in the incidence of insects and pests, as the forest fires no longer keep them under check. In some areas after the sudden stoppage of Jhoom the attacks of insects and pests had been so heavy that 50 per cent of the crops were lost. Moreover, it is believed that burning also retards the growth of weeds in the Jhoom clearing by destroying the roots of the tubers and seeds of the weeds. It renders the tubers and roots dormant for a period of time.

The shifting cultivator thus reaps a number of very tangible technological advantages i.e. lesser input of labour, the pests and insects and fungi destroyed, the soil neutralised and fertilised, and less time and labour spent on weeding etc. If the fire had not helped him in this manner, he would have laboured

more and reaped less.

The spine of the hill man is used to the slopes. He finds it [illegible] to work on [illegible] to [illegible] thi[illegible] du[illegible] cul[illegible] hill[illegible] lan[illegible] co[illegible] is [illegible] ma[illegible] cul[illegible] ed [illegible] whe[illegible] land[illegible] mo[illegible] vati[illegible] need[illegible] valle[illegible] afte[illegible] padd[illegible] had [illegible] rath[illegible]

Fu[illegible] Jhoo[illegible] promise between pure hunting and food gathering on the part of the men and the very limited kitchen garden cultivation practical for the women in the habitations, during the very process of movement to the Jhoom fields and working them (that limited hunting) the trapping of animals, even of the smaller ones like squirrels and birds etc. could be carried out. The jungle inside the Jhoom clearance, before and after its burning and the forest immediately surrounding the Jhoom fields yield a variety of vegetables, mush-rooms, tubers, not to mention the firewood which could be conveniently taken away by children, and thus provide a more varied diet as well as a diversification of activity which contributes towards a happier and more balanced mental make-up than a single minded concentration in cultivating permanent terraced fields.

The shifting cultivators usually grow mixed crops on Jhoom fields. They harvest continuously for a long period and obtain an admixture of crops one after the other which provides them almost with everything they need for their daily use. Whatever little extra they require, they collect from the forests. They sell or purchase very little, if at all! They virtually generate no economic surpluses, and effect no exchanges.

Moreover, on Jhooms, lesser labour input per day on an extended period of time is required, which is what a family can manage more easily compared to the intensive labour input requirement of a settled cultivation particularly of irrigated terraced paddy fields.

A study conducted by the author [illegible] input and output

New Jhooms on the virgin or forested lands are highly productive [illegible] when terraces [illegible] cut away [illegible]

[illegible] do not acquire the required fertility for a long time. But over a time and with inputs, terraces tend to improve in fertility, but the reverse is the case with Jhoom lands. Over a time, population pressures and various other compulsions lead to reduction in the Jhoom cycle, which in turn encourages larger areas under Jhoom cultivation because the shifting cultivator strives to harvest his requirements on lesser and lesser yielding lands. A stage may however come when it becomes utterly uneconomic to spend some labour and waste the seeds as the output would be miserably low even to permit those meager inputs.

The Disadvantages of Swidden

Severe reduction of Jhoom cycle, associated with higher rate of soil erosion, resulting in a drastic and sudden fall in the land fertility, severely disturbs the 'land and man equilibrium'. The disadvantages are discernible to the soil experts. They know and can clearly foresee and visualise that the shifting cultivation in the long run denudes the hills, covered by beautiful forests, runs the generative soil down the hills, dries-up the streams and brooks which oozed out of the blanket of forests, to sustain the game and regenerate the old Jhoom sites at a rapid pace. The soil, which was built by nature over the centuries runs down the slopes in a matter of seasons. The risks of soil erosion get greatly pronounced in heavy rain zone areas. Planning of crops in traditional anti-contour manner to save the crops from water logging aggravates the situation, and the soil erosion process is accelerated. With the destruction of generative top soil, the productive capacity of the soil is destroyed. "The world civilisation has survived on six to nine inches of the top soil. Remove one third of the skin cover of man, and he will die; scrape-off the top soil of the earth and life will cease to exist. With the loss of the fertility of good earth, many a civilization in Asia, Africa, Europe and other parts of the world have disappeared. Who among us does not see the craggy hillocks with stones jutting out and how many among us feel that once they had a cover of trees and grass but have been reduced to a sorry state by the neglect of man and fury of nature.

It is the top soil that eventually becomes impoverished in the hills as a result of generations of ever extensive Jhooming to meet the requirements of an ever increasing population. A stage may arrive when even an input of household labour and seeds from the last year's harvest may become uneconomic judged from the output. Jhooming is the most primitive agricultural practice. In this destructive process, the character of vegetation undergoes a drastic change. The regression proceeds pace and the forest of high trees gives place to low vegetative cover, such as bamboos, grasses and shrubs.

With the increase in population, the pressure on land tends to intensify and wider areas give way to low shrubs from the magnificent cover of tall trees that sustains what is good in Jhooming as a method of cultivation and as 'teacher' of a way of life. The most serious imbalance is brought about by the destruction of the equation between the hunting-cum-collectional economy and Jhooming. Next in importance comes the disappearance of the mountain streams. Disappearance of these streams also comes in the way of the construction of irrigated terraced fields at a later stage.

All the above mentioned disadvantages are, however, not visible to the man who causes it. He is not yet enlightened about it. Even if he is told that after a hundred years his land would be impoverished, he would not change. What else can he do 'now' to live? To him 'now' is more important than 100 years hence. He continues to reap the advantages from the swidden type of

cultivation. To him, the advantages are real and available, and he has not seen the denuded hills and impoverished lands, and perhaps it is beyond his comprehension that the swidden cultivation done by the people of distant past has created the impoverished land conditions on the hill slopes of many countries of the world.

Shift from Swidden to Sedentary:

In summation, it may be said that with the reduction in Jhoom cycle, the soil fertility quickly decreases resulting in further reduction in the Jhoom cycle. Leaching, erosion and loss of fertility takes place with rapidity The yields per unit of land becomes progressively lesser and lesser. All this further aggravates the situation The progressive reduction of Jhoom cycle and its fertility makes the shifting cultivator increasingly poor in spite of his putting in much harder labour In distress, he is slowly forced to sell away or eat up his livestock. He and his family members begin to swarm the unskilled daily wage market. His nutritional levels fall, and he is no longer cheerful, well-fed and healthy He learns the hard lessons of poverty and deprivation With the fall in nutritional levels, they easily succumb to many diseases. Once the stage is reached where the Jhooms are no longer productive, all else happens swiftly.

Sub-marginal Jhoom lands are pushed out of cultivation, and wherever possible the bench terraces which have over the years gained in fertility and can produce better than the marginal Jhoom lands come to be cultivated. Sedentary cultivation receives their practical indulgence. At this step, the shifting cultivators need understanding and careful expert handling to make them cross the confusing cross-roads

Time to Introduce New Technology

Therefore, it follows that much before reaching that final stage of communal destruction, technological shift in agricultural practices has to be inculcated Obviously, this can be done by introducing the practice of sedentary cultivation at the present stage of a Jhoom based community, even though the present productivity of the sedentary cultivation may be lower than that of Jhoom fields Because, as the fertility of Jhoom fields gets further reduced as the result of reduction of Jhoom cycle and consequent reduction in fertility of Jhoom fields, the downward trend of the fertility of Jhoom fields will equate with the productivity of sedentary cultivation, at a point of time When that happens, a switch over to sedentary cultivation will be automatic if the base for the same has already been created. It may not be unreasonable to think that with added inputs the productivity of sedentary cultivation may catch up with that of the Jhoom fields much earlier than what can usually be predicted In that event, sedentary cultivation may become more popular much before the Jhoom fields have lost their fertility below the minimal level Such a situation will have two effects Firstly, a large portion of the community will take to sedentary cultivation producing an agricultural surplus sufficient to meet the requirements of the community, allowing the Jhoom fields to alter its technological holding to such alternatives, like horticulture and forestry management. Secondly, the residual of the community which cannot take to the sedentary cultivation, because of lack of extraneous resources, or because of compulsions that may be inherent in the socio-economic conditions of the community, such as in ownership rights on land, will be able to continue to derive a marginal subsistance from the community Jhoom fields, which have not yet lost their productivity below the minimal level This will safeguard against social disturbances potent in changing technological holding on land from the traditional pattern to something else .□

TELECOMMUNICATIONS IN NORTH-EASTERN REGION

DR. P.N. CHOUDHRY

POSTS AND TELEGRAPHS Services are an essential component of the infrastructure for the economic and social development of a country These services are vital for Government Administration, efficient operation of trade and commerce, social intercourse and personal communication By establishing close links between different parts of the country, the P & T services convey a sense of unity and national integration

The North-Eastern Telecommunications Circle serves the States of Assam, Manipur, Meghalaya, Nagaland, Tripura and the Union Territories of Arunachal Pradesh and Mizoram covering an area of 250,433 sq. km having a population of over 195 lakhs according to the 1971 census

The topography of the Circle having seven strategic States, comprising mostly hilly terrain (except the valley of Assam), the mighty Brahmaptura with its 129 tributaries bringing unprecedented floods which is almost an annual feature, makes the maintenance of communication a challenging job. Other natural calamities like landslides, wild elephants, phenominal growth of vegetation and the limited road and rail communication facilities present a wide range of problems faced in the maintenance of telecommunications.

At the beginning of the First Five Year Plan, there were only 13 exchanges and 3265 telephone subscribers in this Circle. The total number of exchanges in this region stands at 192 today with 27400 telephone subscribers Seven new telephone exchanges have been commissioned during the last seven months of the current year itself and another two will be commissioned during the P & T Week In 190 of these exchanges, waiting lists have been fully wiped out and telephones are being provided on demand to applicants

Trunk Service

The total number of trunk exchanges in the North Eastern Telecom Region stands at 45 today with over 1200 trunk circuits The trunk service in the region originally depended mostly on the overhead lines which were subjected to frequent interruptions due to various reasons like difficult terrain, floods, cyclones, storms, thick jungle growth and copper wire thefts. With the installation of the first major microwave link in 1966 connecting Calcutta, Siliguri, Gauhati, Shillong, Jorhat, Tezpur, Dibrugarh and Tinsukia, communications started to stabilise Several new cities have since been brought on microwave map Today North Eastern Region is already the biggest user of microwave Links in India. Work on the Rs 19 crore project for broadband microwave system is also in hand In the rural areas too, the total number of trunk public call offices has risen to 268 by now It is, therefore, not surprising that the number of trunk calls handled in the exchanges of N E Region has reached an all time high of over 55 lakhs a year During November 1976, the trunk call effective percentage has already crossed the objective of 80 per cent in several exchanges, including 84 per cent in Gauhati and 92 per cent in Itanagar which is the highest ever for this sector

The building for trunk automatic exchange at Shillong has already been completed at a cost of Rs 7 lakhs This exchange will, in course of time, provide subscriber trunk dialling facility, not only to all the automatic exchanges of the region connected by microwave system but even to those in the rest of the country. Trunk automatic exchange will also provide facility of dialling the booked trunk calls to large number of stations all over the country without having to provide individual dialling circuits to all those stations Ultimate capacity of this exchange will be 2000 lines Initially only 800 lines will be installed at a total project cost of about Rs. 45 lakhs

Demand trunk facilities have been introduced in a big way in this region As against two demand trunk routes existing till about six months back, 16 more routes have since been provided with demand trunk facilities. Demand trunk calls, as compared to normal booked calls are connected immediately and have become immensely popular in this region

Although excellent communication medium suitable for STD is available through the microwave system in this area, existence of a large number of manual telephone exchanges has been frustrating this possibility. Working on the philosophy of 'appropriate technology', a scheme for manual STD was conceived and the first such service was introduced, as an expeimental measure, between Tezpur and Gauhati in August this year.

Telex is the short name of the teleprinter exchange. There are two such exchanges working in this region at Gauhati and Shillong. In all 116 telex connections are working through these exchanges. The 20-line telex exchange at Shillong is proposed to be replaced by 50 lines. At Gauhati, a 100 line telex exchange is operating Expansion by 40 lines is expected to be taken up during 1977-78 These two expansions will wipe out the waiting lists. Work on installation of a 50-line telex exchange at Dibrugarh will be started shortly Telex exchanges are also likely to come up at Kohima, Imphal, Jorhat, Agartala, Silchar and Tinsukia

Rural Development Plans

As the bulk of the country's population lives in rural areas with an economy that is predominently agricultural, plans for extending telephone and telegraph facilities to 120 new stations in the rural areas of this region have already been finalised The work on some of these has already commenced. Plans for extending telephone and telegraph facilities to the tribal growth centres have also been completed for most States

A large portion of the long distance telegraph traffic is carried over teleprinters working on voice frequency telegraph channels Eleven departmental telegraph offices are working in this Circle and two more at Kohima and Aizawal are expected to be opened very shortly A full-fledged Departmental Telegraph Office has also been approved for Itanagar There are over 622 combined Posts and Telegraph Offices serving the rural areas in this region. The number of telegrams handled through this network is now over 90 lakhs a year.

Shri Choudhry is General Manager, North-Eastern Telecommunications Circle

Prospects for Growth of Electronics Industry in Hill Areas with Special Reference to North-Eastern Region

A. K CHAKRAVARTI AND
R. C. CHOPRA

The hill areas, particularly those in the vicinity of the Himalayan Range, due to their peculiar geographical characteristics and limited infrastructural facilities, have remained relatively insulated from the impact of industrial activities in the plains The Government of India, conscious of this fact, is making considerable efforts to promote regionally balanced development, and has extended a number of incentives in the form of financial assistance and other subsidies/incentives

The present report aims at assessing the prospects for the growth of electronics industry in hill areas, reviews the various incentives/assistance provided by the Central and and respective State Governments, the current status of industrial activities and the socio-economic and educational background of these areas This background is used to analyse and identify those electronics items whose production can optimally utilise the existing facilities and have a potential for growth in these regions Estimate of the demand for radios/TVs has been made to bring out the feasibility of growing small scale units in hill areas and some working financial/technical details have also been worked out Suggestions have been made for promoting entrepreneurship in the electronics industry and creating awareness towards the use of electronic equipment for enhancing the productivity, particularly in industries which are based on the natural resources of hill areas such as tea, forest and agro-based industries.

IT HAS BEEN the constant endeavour of the Government of India to ensure a regional balance with regard to the level and the rate of development amongst the different regions in the country This objective was, however, attained only to a limited extent during the first three Five Year Plans and a new and different approach had to be initiated in 1968 Though India has made considerable progress during the past decade in the expansion as well as diversification of the industrial base, the hill areas, to a large extent, have remained relatively insulated from the full impact of developmental activities In order to promote industrial/developmental activity in the hill areas, there is need for a concerted effort to understand the whole range of factors responsible for backwardness in these areas, the peculiar physical geographical features, the highly-dispersed population, the near absence of a vocational diversification, meagre in-frastructural facilities, institutional and other shortcomings

There is also a realisation that unless adequate programmes are evolved for the conservation and proper utilisation of the resources of the hill areas, problems would arise not only for those areas themselves but also for other regions in the form of large-scale migration of people from hill areas in search of employment

A Committee of the National Development Council recommended as early as 1965 that special measures should be taken to accelerate the process of development in the hill areas The initial task of identifying industrially backward areas was first taken up in 1968 with the setting up of a committee under the chairmanship of Mr. B.D. Pande. Another committee under the chairmanship of Mr N.N. Wanchoo was appointed to suggest fiscal and financial incentives for promoting industrial development of backward areas. The wanchoo Committee, in 1969, recommended two or three districts in each backward State for special incentives. The assistance was to be in the form of a subsidy equivalent to one-tenth of the fixed capital investment in new projects or for expansion of existing projects provided the toal fixed capital investment requirement did not exceed Rs 5 million. Details of the incentives extended by the Central/State Government for promoting industrial activity in the backward areas are given later in this article.

In preparing the Draft Fifth Five Year Plan, the Planning Commission urged the State Governments to draw up separate integrated plans for their respective hill areas. The main strategy proposed was that since the hill areas differ in their

Source — Covered under Copyright Regulation for IPAG Technical Analysis Report — 108. *Reprinted from Electronics In-formation and Planning, October,* 1976

resource endowments, problems and potentialities, they should be looked upon as distinct entities and programmes/schemes of specific relevance to them only be drawn up.

In order to bring into focus the enormous potential of hill states and evolve a practical strategy for harnessing it not only for the benefit of the hill states but also in the larger national interest, a National Seminar on Problems and Potential of the Hill Areas of India was held during 25-28 April 1975

Recently a Hill Area Planning Cell has been set up in the Planning Commission to undertake studies for formulating strategies of development in those areas In the Fifth Five Year Plan, priority has been accorded to regional schemes of agriculture, power and communication forwarded by North-Eastern Council (NEC) for securing a balanced development of the north-eastern region. It is expected that in the first three years, an expenditure of Rs. 280 million would be incurred on such schemes. Owing to initial difficulties in identifying and implementing schemes, the programme has had a slow start. It is, however, gathering pace A provision of Rs 620 million has been kept for the next two years. During the first three years of the Plan, central allocations would be of the order of Rs 760 million while the states are likely to invest about Rs 680 million. A provision of Rs. 940 million is earmarked for the next two years in the Central Plan

Classification of Hill Areas

The hill areas in India primarily comprise the Himalayan Ranges from Arunachal Pradesh in the east to Jammu and Kashmir in the west extending over a length of about 3,200 km with a width of 80 to 320 km

The following regions have been classified as hill areas as per the census

(i) Jammu and Kashmir
(ii) Himachal Pradesh
(iii) Uttar Pradesh—Districts of Uttar Kashi, Chamoli, Pithorgarh, Tehri Garwal, Garwal, Nainital and Almora
(iv) Sikkim
(v) Arunachal Pradesh
(vi) Nagaland
(vii) Manipur
(viii) Mizoram
(ix) Tripura
(x) Meghalaya
(xi) Assam—Districts of United Mikir and North Cachar
(xii) West Bengal—Darjeeling district
(xiii) Tamil Nadu—Nilgiri district

For the purpose of conducting a survey of industrial potential in hill areas, it may be appropriate to group them from the point of view of geographical proximity, similar cultural and historical background, and the common natural limitations for building the industrial infrastructure. From this angle, the hill areas are grouped as follows

(a) North Eastern Region—Sikkim, Arunachal Pradesh, Nagaland, Manipur, Mizoram, Tripura, Meghalaya, hilly districts of Assam and West Bengal

(b) Northern Hill Areas—Jammu & Kashmir and Himachal Pradesh

(c) Parvathiya Uttar Pradesh—Districts of Uttar Kashi, Chamoli, Pithorgarh, Tehri Garwal, Garwal, Nainital and Almora.

Hill areas other than the ones in the proximity of Himalayan Range and Parvatiya Uttar Pradesh have not been included for this particular study.

Hill Areas : An Overview of the North Eastern Region

Hill areas in the North-Eastern Region comprise Arunachal Pradesh, Assam (United Mikir and North Cachar districts), Manipur, Meghalaya, Mizoram, Nagaland, Sikkim, Tripura and Darjeeling district of West Bengal The entire region is a geographically compact unit. Each hilly region in small states is a relatively small area and the development of industrial infrastructure in each state by itself for major projects may not be a viable proposition for all sections of the industry. Therefore, it is necessary for any meaningful, pragmatic planning that the complementary resources/ endowments of the constituent units are integrated to evolve a regional plan. As such the entire region is backward and some of the states are newly formed, and therefore are not geared up for large scale resource mobilisation and even utilisation.

Recognition of the above fact has resulted in the formation of the North-Eastern Council with the Parliament Act No. 84 of 1971 looking after the interest of the area comprising the States of A Manipur, Meghalaya, Na and Tripura, and the Union tories of Arunachal Prades Mizoram. The functions c Council are detailed below

The Council is an advisory and discusses any matter in some or all of the States repr ed in that Council, or the Unic one or more of the States repre in that Council, have a commo rest and advises the Central G ment and the Government o State concerned as to the act be taken on any such matter, a particular, discusses and mak commendations with regard any matter of common inter the field of economic and planning, (ii) any matter conce inter-state transport and munications, and (iii) any n relating to power or flood c projects of common interest.

For securing the balanced lopment of the north-eastern the Council forwards prop (a) formulating for the States, resented in the Council a u and co-ordinated regional (which is in addition to the Plan) in regard to matters of mon importance to the area regarding the priorities of the jects and schemes included i regional plan and the stages in the regional plan may be i mented, and (c) regarding the tion of the projects and scheme cluded in the regional plan, t Central Government for its c deration.

The Council (a) reviews from to time, the implementation o projects and schemes include the regional plan and recomm measures for effecting co-ordin among the Governments of States concerned in the matt implementation of such pro and schemes; (b) where a proje scheme is intended to benefit tw more States, recommends the ma in which (i) such projects or sch may be executed or implemented managed or maintained, or (ii) benefits therefrom may be sh or (iii) the expenditure thereon be incurred; (c) on a review progress of the expenditure, re mends to the Central Governr the quantum of financial assist to be given, from time to time the State or States entrusted the execution or implementatio any project or scheme include the regional plan; (d) recomm

to the Government of the State concerned or to the Central Government the undertaking of necessary surveys and investigation of projects in any State represented in the Council to facilitate consideration of the feasibility of including new projects in the regional plan

The Council reviews from time to time the measures taken by the States represented in the Council for the maintenance of security and public order therein and recommend to the Governments of the States concerned further measures necessary in this regard.

Before proposing the areas for futuristic growth in the North-Eastern Region and the conscious plans for such growth, it may be appropriate to dwell in brief on the socio-economic and educational background of the Region, the existing infrastructure and industrial base and identification of industrial potential areas naturally more suited for the Region

Arunachal Pradesh

Arunachal Pradesh (earlier known as NEFA) is a mountainous territory in the north-eastern part of the country bordering Bhutan, Tibet, China and Burma The total population of the Union Territory is about 500,000 and literacy is less than 12 per cent About 50 distinct languages and dialects are spoken Arunachal Pradesh is not one socio-economic unit, but a conglomeration of cultures based on different tribal practices

Principal industries are forest-based. There is no major industry in the Union Territory Three medium and eleven small scale industries are functioning under private cooperative sectors. Medium and small industries established include saw mills, plywood and veneering mills, rice mills, fruit preservation units, oil expellers besides handloom and handicrafts industries There is no major irrigation or power project in Arunachal Pradesh other than four micro-hydel projects

Training in various trades such as wood-carving, weaving, carpentry, etc., is imparted from the various training and production centres besides producing articles on a mass scale. An Industrial Training Institute (ITI) at Roing gives training on technical trades.

The joint financial/institutional study team in their industrial potential survey report has identified some forest-based, agriculture-based and mineral-based industries (also by NIDC) for setting up in the Territory.

Assam

The Assam State is bound by Bhutan and Himalayan Ranges in the north, Arunachal Pradesh in the north-east, Nagaland, Manipur and Burma in the east, Bangladesh and Tripura in the south and south-west and West Bengal in the west Assam is divided into the plains of Brahmaputra valley and the hill divisions. The districts of United Mikir and North Cachar Hills are the hill areas in the State

Assam is primarily an agricultural State. The principal food crop is rice while the main commercial crops include tea and jute Assam contributes about 50 per cent of the total tea production of India.

Petroleum and petroleum products form the other main industries. New industrial units being set up in the Central sector are a refinery, paper mills at Nowgong and Cachar districts and a petrochemical complex at Bongaigaon. Other industrial establishments include Asoka Paper Mills Ltd., at Jogighapa, Assam Alkali Allied and Chemical Ltd., Jogighapa and Assam Petrochemical Ltd, Namrup

Assam has three universities, viz., Agricultural University, Jorhat, Gauhati University, Jalukbari, Gauhati and Dibrugarh University, Dibrugarh Assam is among the highly literate States in the country. Under the craftsmen training scheme, 12 mechanics are trained at Gauhati for radio and TV work.

During the Fifth Plan period, schemes related to large and medium industries under the Assam Industrial Development Corporation for the hill areas in Assam State include starch and glucose plant (Mikir Hills), sugar mill (Mikir Hills), cement plant (North Cachar Hills) and paper mill (North Cachar Hills) with a capital outlay of Rs. 41 8 million. For mineral development activities in hill areas, some expenditure is indicated.

Manipur

Manipur is bound in the north by Nagaland, in the south by Mizoram, in the east by Upper Burma and in the west by Cachar district of Assam. Nearly 92 per cent of the total land area is hilly and covered with forests. Manipur's economy is essentially agrarian; about 85 per cent of the population is dependent on agriculture for livelihood.

The State has no large scale industry. Handloom weaving is the largest single cottage industry. To accelerate the development of small scale industries, an Industrial Advisory Board has been set up and the jurisdiction of Assam Financial Corporation has been extended to Manipur. At Takyelpat near Imphal, an industrial estate is being set up.

There are a good number of colleges in the State and also a government polytechnic. Under the craftsmen training scheme, 16 mechanics are trained at Imphal for radio and TV work.

Meghalaya

The State of Meghalaya consists of two districts, viz., Garo Hills and Khasi and Jaintia Hills. In area and population, Meghalaya is bigger than Nagaland. Its important urban centres are Shillong, Jowai and Cherrapunji in K&J Hills and Tura in Garo Hills.

Forest and forest products are the chief resources of the State. Economic plantations of industrial and commercial use are being undertaken extensively. Meghalaya is rich in mineral resources which are virtually untapped because of transport difficulties In the organised sector, the main industrial unit in the State is the cement factory at Cherrapunji. The State Government has set up an Industry Development Corporation (MIDC) to promote, establish, undertake and implement industrial programmes having prospects of development in the region and also help the industries in the private sector. MIDC has secured nine licences and completed several feasibility studies. The ventures which are in the process of being set up include a tannery project, electronics project, the Meghalaya Metals and Minerals (P) Ltd., a roller flour mill, match splint, paper projects, cotton spinning mill, welded wire mesh and a hard bright wire unit.

Recently, the North Eastern Hill University has been set up at Shillong. Also, a number of colleges and a technical school are imparting training to Meghalaya State. The literacy in Meghalaya State is fairly high.

Mizoram

The Union Territory of Mizoram is bound by Cachar district of Assam in the north, Manipur in the north-east, Burma in the east, Bangladesh

in the south-west and Tripura in the north-west.

Paddy is the principal crop in the Territory. There is no major industry. Handloom and handicrafts are the only cottage industries. Communications have been a great problem.

Nagaland

Nagaland is bound by Assam in the north and west, Burma and Arunachal Pradesh in the east and Manipur in the south The population of the State is about 500,000

Agriculture is the main occupation of the people of Nagaland There is no major industry in the State Three major industrial projects have been taken up A sugar mill at an estimated cost of Rs. 40 million has been set up at Dimapur. A distillery unit, with a daily capacity of 1,000 gallons of alcohol, is also to be added to the mill. The second is a paper and pulp mill at Tuli in Mokokchung district with an estimated cost of about Rs. 360 million, a joint venture of the State and Central Governments The third is a plywood factory at Tijit in Mond district. There is scope for small scale industries, especially in the Dimapur area for producing light engineering goods

At Kohima, under the craftsmen training scheme, 16 mechanics can be trained for radio and TV work

Sikkim

Sikkim became a full fledged State of the Indian Union on 26 April, 1975. Sikkim is also an agrarian state. *It has an area* is 7,299 sq km with a population over 200,000 About a third of the area is covered by forest

The Sikkim Mining Corporation, Rangpo, set up in 1960, produces copper, lead and zinc The copper mine of Dikchu is under exploration The Government Institute for Cottage Industries set up in 1957 at Gangtok, encourages local handicrafts. Important industrial ventures include the fruit preservation factory at Singtam, the distillery near Rangpo and a tannery at Majhitar.

Owing to hilly terrain, two-thirds of the State has no proper road links. Therefore, the Public Works Department has now launched a massive programme for construction of new roads in the interior areas which has remained inaccessible so far In the field of communication, besides other expansion programme, a major event was the commissioning of the direct teleprinter line connecting Gangtok with Delhi and Calcutta

Tripura

Situated in the south-west of Assam, bordering Bangladesh, Tripura State is generally regarded as one of the inaccessible areas The State covers an area of about 10,500 sq km with a population of more than 1.6 million.

Over 60 per cent of the total geographical area of Tripura is covered under forests. Mineral occurrence of lignite coal, limestone and ochre have been reported, but these have yet to be commercially exploited

Tripura Government has also drawn up sericulture expansion schemes and cattle and duck-breeding schemes with the assistance of the North-Eastern Council There are two major industrial projects coming up in the State These are (i) paper and pulp project at Fatikroy near Agartala with an estimated investment of Rs 750 million, and (ii) the Rs 68 4 million jute mill of Tripura Jute Mills Ltd at Hapania near Agartala.

At Indernagar, Agartala, under the craftsmen training scheme, 16 mechanics are trained for radio and TV work

INCENTIVES FOR INDUSTRIAL DEVELOPMENT

Central Government Incentives*

As part of the measures to ensure balanced regional development, the Government of India has announced certain financial incentives for industries established in selected backward districts/areas. These are in addition to the facilities and incentives that are offered by individual State Governments In Hill areas, in addition to the incentives mentioned above in selected backward areas in them, certain transport subsidy is also provided. The incentive schemes for the hill areas as a whole, as announced by Government of India, are indicated below.

(1) Central Outright Grant of Subsidy Scheme 1971

The list of the hill areas covered under the scheme and the crucial date from which they will be eligible. (See Table 1)

Eligibility

Only those industrial units which were set up after October 1 1970, August 26 1971 or March 1 1974 or in respect of which effective steps were taken after the crucial date will be eligible. (See Table 1.).

Effective steps shall mean one or more of the following.

(a) Sixty per cent or more of the capital issued for an industrial undertaking, which is a public company within the meaning of the Companies Act, has been paid up

(b) A substantial part of the factory building has been constructed.

(c) A firm order has been placed for a substantial part of the plant and machinery required for the undertaking.

All industrial units including serving units, having fixed capital investment in land, building and machinery irrespective of the amount of their capital equipment, other than those departmentally run, whether in public or private/joint/cooperative sections are eligible

Existing units can claim subsidy for effecting substantial expansion after the crucial dates mentioned in so far as the expansion portion is concerned

Quantum

For claims relating to the period ending 28 February 1973, the subsidy will be 10 per cent of the fixed capital investment or Rs, 500,000, whichever is lower For claims relating to the period commencing from 1 March 1973, the subsidy will be 15 per cent of the fixed capital investment or Rs. 1.5 million, irrespective of the capital cost of the project, whichever is lower.

Income Tax Exemption on Subsidy

Capital subsidy disbursed under this scheme would not be taxable as income or revenue receipt in the hands of recepients

Procedures

The subsidy has to be claimed from the State Governments who scrutinise the claims through state level committees. The industrial units have to comply with the procedures and other requirements as devised by the respective State Governments.

However, the following general guidelines will be applicable.

(a) Units related to col 3 of Table 1 which took effective steps between the period 26 October 1970 and 26 August 1971 should have got

**Relevant excerpts from Guidelines for Industries 1976-77, Department of Industrial Development, Ministry of Industry and Civil Supplies, Government of India New Delhi.*

themselves registered with the State Authorities by 31 May 1972.

(b) Units related to col. 4 of Table 1 which took effective steps on and after 26 August 1971 should have got themselves registered by 31 December 1973.

(c) New units and units effecting substantial expansion should register themselves with the state authorities before taking effective steps for starting production or substantial expansion as the case may be.

(2) *Concessional Finance Scheme*

Coverage

A list of the industrially backward hill districts which qualify for this scheme is given in Table 2.

Under this scheme, Industrial Development Bank of India, Industrial Finance Corporation of India, and Industrial Credit and Investment Corporation of India extend financial concession in the form of low rate of interest, longer initial grace period and reduction of commitment charges, etc. The small scale units get these facilities through the State Financial Corporations while the medium and large scale units can apply directly to these institutions for concessional finance. The terms and conditions prescribed by each of these institutions are given in Appendix—I to III.

(3) *Transport Subsidy Scheme*, 1971

Area Covered

This scheme is worked out purely to give transport subsidy to all industrial units in hill areas, viz, Jammu & Kashmir, Assam, Meghalaya, Nagaland, Manipur, Tripura, Arunachal Pradesh, Mizoram, Himachal Pradesh and the hill districts of Uttar Pradesh.

Eligibility

All industrial units (barring plantations, refineries and power generating units), both in public and private sectors, irrespective of their size, are eligible for the subsidy. Expansion/diversion cases are also covered.

Quantum

It is 50 per cent of the transport cost of raw materials as also of finished products between the railway head at Pathankot or Jammu and the location of the industrial units whichever is shorter, in the case of Jammu and Kashmir, between Siliguri and the location of industrial units in the case of the north-eastern region, between Pathankot, Kirathpur Sahib, Nangal, Kalka, Ghanauli, Yamuna Nagar, Barara and Hoshiarpur and the location of the industrial units in the case of Himachal Pradesh; and between Dehradun, Rishikesh, Moradabad, Bareilly, Kotdwara and Shahjahanpur and the location of industrial units in the case of hill districts in Uttar Pradesh. No subsidy on internal movement within the State/area is allowed In the case of the north-eastern region, if the goods are moved entirely by road, the subsidy will be limited to the sum of road transport cost for that part of the journey for which there is no rail transport and the rail transport cost for that part which is connected by rail.

Procedure

The claims for subsidy should be submitted to the Director of Industries of the State concerned. The unit will have to fulfil the requirements of the State authorities as to pre-registration, application form, procedural requirements indicating the costs of transportation, etc.

TABLE 1

List of industrially backward hill areas selected to qualify for the Central Subsidy Scheme as on 21-7-1975)
districts/Areas Selected

Sl. No.	State/Union Territory	Upto 18-7-72 under the original form of the Scheme	After 18-7-72 under the extended form of the Scheme	Remarks
1	Assam	Goalpara, Mikir Hills	Cachar, Kamrup, Nowgong, New Lakhimpur	District of North Cachar hills not covered.
2	Himachal Pradesh	Kangra*	Chamba, Kulu, Sirmor, Solan (6th distt under consideration).	
3	Jammu & Kashmir	Jammu, Srinagar	Anantnag, Baramula, Doda, Poonch	About 75% of the population in the State covered
4	Manipur	All the five districts viz, Manipur North, West, South, Central, East	—	Entire State covered
5	Nagaland	Kohima, Mokokchung	Tuensang	Entire State covered.
6	Meghalaya	United Khasi & Jaintia Hills, Garo Hills	—	Entire State covered.
7	Sikkim	—	All the four districts of Gangtok, Gyalshing. Mangan & Namchi	Entire State covered
8	Tripura	Tripura West South, North.	—	Entire State covered
9	Uttar Pradesh	Balia, Jhansi.	Almora, Basti, Faizabad, Rai Bareilly	Only Almora district out of the districts of Uttar Kash, Chamoli, Pithorgarh, Tehri garhwal, Garhwal, Nainital & Almora declared as hill areas in UP The scheme covers about 14% area of the total hill areas in UP with only 23% of the population.
10	Arunachal Pradesh	—	Entire Territory	Entire Territory covered.
11.	Mizoram	—	Entire district excluding the area within the municipal limits of the Territory's capital.	Except for the municipal limits of Aizawal, entire Mizoram Territory covered.

*Represents districts as they existed prior to their recent reorganisation.

Note · In the case of districts/areas selected under the Original Scheme, the industrial units taking effective steps on or after 1 October 1970 would be eligible for investment subsidy

In respect of districts/areas selected under the extended form of the scheme, those industrial units would be eligible for the subsidy which take effective steps on or after 26 August 1971.

(4) *Special Tax Rebate for Industries Set up in Backward Areas*

Under a provision introduced in 1974, 20 per cent of the profits and gains derived from newly established industrial undertakings or hotel business in the backward areas are exempt from income tax. These exemptions are available for the first 10 assessment years of the undertaking, provided certain conditions are satisfied.

(a) The undertaking should not be formed by transfer of machinery and plant previously used for any purpose in any backward area

(b) It should employ 10 or more workers in a manufacturing process carried on with the aid of power or 20 or more workers where no power is used.

(5) *Concessions for Supply of Machinery on Hire Purchase by National Small Industries Corporation*

National Small Industries Corporation has reduced the rate of interest from 13.5 per cent to 11 per cent for supplying machinery on hire purchase to industrial units set up in backward areas. In the case of indigenous machinery, the earnest money to be deposited has also been reduced from 20 per cent to 10 per cent and to 5 per cent in the case of imported machinery.

(6) *Import Facilities for Units to be Set up in Specified Backward Areas*

The import policy has been liberalised to a very great extent for the import of raw materials, components and spares in respect of small scale units to be set up in hill areas listed in Table 1 The special facilities, among others, are:(i) all units in the nonselect list will be treated as select units, (ii) mode of financing in respect of these units would be 75 per cent free foreign exchange and 25 per cent in UK credit, and (iii) any unit whose entitlement works out to Rs. 20,000 will get the imported raw materials in free foreign exchange.

Such units will be eligible for preferential pricing in regard to the supply of canalised raw materials by canalising agencies against release orders, as if they are exporting units.

State Government Incentives

In order to attract new industries both in the hill as well as other backward areas, the State Governments in their respective regions operate various schemes of incentives/concessions These normally pertain to provision of essential infrastructure facilities like land, power, water, raw materials, etc., at concessional rates, subsidsing the cost of preparation of feasibility reports, provision of interest-free loans and marketing assistance, exemption from State sales tax and octroi duties besides providing technical guidance and training programme for new entrepreneurs. The quantum and value of these incentives offered by various State Governments differ from State to State considerably. A summary of their incentives Statewise is given below

North-Eastern Region

(1) *Arunachal Pradesh*

All the special incentives provided by the Central Government for setting up industries in selected backward areas and also by specialised financial institutions as given earlier, are available in the entire region of Arunachal Pradesh. Besides these, efforts are being made by the Administration of Arunachal Pradesh to accord maximum facilities to the local entrepreneurs like by way of protecting trading and other types of business activities only to the tribals. The Administration provides financial assistance by way of industrial loans upto a maximum of Rs 20,000 at 6 per cent interest. The other concessions include free registration of industrial units, procurement and distribution of scarce and controlled raw materials for industrial units in the Territory by the Industries Department and giving price preference including no sales tax) for the products of the Territory.

(2) *Assam*

In Assam, the districts of United Mikir and North Cachar have been declared as hill areas. Out of these, only Mikir Hills has been selected to qualify for Central Subsidy Scheme. However, both the districts qualify for financial concessions from financial institutions. The Central Transport Subsidy Scheme is applicable to the entire State.

The following are the institutions in the State providing assistance to the prospective entrepreneurs

(i) Assam State Financial Corporation (AFC)
(ii) Assam Ware house andMarketing Corporation
(iii) *Assam Small Industries Development Corporation (ASIDC)*
(iv) Assam Agro Industries Development Corporation
(v) Assam Government Marketing Corporation
(vi) Assam Industrial Development Corporation
(vii) Regional Research Laboratory, Jorhat

Land and building: Developed plots in selected industrial areas with infrastructure facilities, and built-up sheds in industrial estates are allotted to entrepreneurs on suitable terms and conditions. One such centre exists at Kalapur (Gauhati) When these are allotted on a long term basis, the State Government subsidises the rent upto 50 per

TABLE 2

List of industrially backward hill districts selected to qualify for concessional finance from the financial institutions (as on 3-1-1976)

Sl. No.	State/Union Territory	Districts	Remarks
1.	Assam	Cachar, Goalpara, Kamrup, Mikir Hills, North Cachar Hills, Nowgong and New Lakhimpur	Entire hill areas covered
2	Himachal Pradesh	Chamba, Kangra*, Kinnaur, Kulu, Lahaul and Spiti, Solan and Sirmur	—
3.	Jammu & Kashmir	Entire State	Entire State covered
4	Manipur	All the 5 districts	-do-
5	Meghalaya	Garo Hills and United Khasi & Jaintia Hills	-do-
6.	Nagaland	Kohima, Mokokchung and Tuensang	-do-
7	Sikkim	All the four districts	-do-
8	Tripura	All the three districts.	-do-
9.	Uttar Pradesh.	All hill districts (viz , Uttar Kahi, Chamoli, Pithorgarh, Tehri Garwal, Garhwal and Almora) except Nainital in addition to other backward districts/areas	Only Nainital amongst hill area-districts not covered.
10.	Arunachal Pradesh	Entire area.	Entire Territory covered
11.	Mizoram	Entire area.	Entire Territory covered

*Represents districts as they existed prior to their recent reorganisation.

cent for an initial period of 3 to 10 years depending on location.

Power : Power is supplied at negotiated rates to industrial units whose electric power cost constitutes a major item of the cost of production. In the case of units which would bring economic benefits to the State, the bulk concessional subsidy for power would be nine paise per unit.

Price preference: Price preference upto 5 per cent (15 per cent to SSI units) is allowed to local industrial products in all government purchases.

Tax concessions: Concession on merits is allowed in sales tax on industrial raw materials/finished products so as to enable local industrial goods to compete with those manufactured outside the State

Feasibility study: In respect of selected industries having definite prospects in the State, the State Government would have feasibility studies/project reports prepared through approved agencies. Project reports will be made available free of cost for small industries to deserving entrepreneurs with condition to implement the project within the stipulated time. The report on minor and medium industries will be made available at the reduction price of 50 per cent to 75 per cent of the cost of preparation

The Assam Financial Corporation (AFC) and the Assam Industrial Development Corporation (AIDC) provides financial assistance to new units in the form of loans and share capital. under the State Aid to Industries Act, the State Government and the ASIDC have a package scheme of incentives to new SSI units, under which loans are granted at concessional rate of interest (11 per cent per annum) besides providing finance for purchase of plant and machinery on hire purchase basis. AFC provides loans upto Rs. 3 million for companies and cooperatives and upto Rs. 15 million to non-corporate units, the interest rate varies between 10.5 and 15.5 per cent repayable in 10-12 years.

(3) *Manipur*

The entire State is eligible for concessional finance from the financial institutions and is also qualified for all the concessions offered by Central Government for industrial development in backward areas including transport subsidy

The State Government has constructed an industrial estate with built-in sheds at Takyelpat with all infrastructure and common facilities. Plots in this estate are allotted for industrial use with 50 per cent concession in the rent, power and water charges. Financial assistance under Small Scale Industries Loans Scheme and Rural Industries Project Scheme is provided by the Directorate of Industries in the form of soft loans and grants.

(4) *Meghalaya*

The entire State is eligible for concessional finance from the financial institutions and is also qualified for all the concessions offered by Central Government for industrial development in backward areas including transport subsidy.

Industrial estates are being constructed by the State Government at Shillong, Mendipathar (Garo Hills) and Burnihat (Khasi Hills) Plots/sheds are being offered to deserving industrial units on suitable terms. With a view to encouraging entrepreneurs from both within and outside the State, the Government of Meghalaya offers a package scheme of incentives which will be available for the setting up of new industries, as well as for expansion or diversification of existing industries in the private and cooperative sectors of the State The major incentives are detailed below

Refund of sales tax: For units with capital investment not exceeding Rs 10 million, the State Government refunds the sales tax paid by the unit on purchase of raw materials and on sale of finished goods for the first 5 years, subject to a maximum of 10 per cent of the value of investment in fixed assets in any one year

Subsidy on power tariff: Power intensive industries are supplied power at special concessional tariff rates. For all other new units, with capital investment not exceeding Rs. 10 million, the State Government subsidises all their power tariff payment over and above nine paise per unit subject to a maximum of nine paise per unit for the first five years.

Exemption from payment of royalty charges for water supply will be allowed for all industrial units for the first five years

Price preference in government's purchase programme is allowed upto 15 per cent of products manufactured by local units

Financial assistance · The Meghalaya Industrial Development Corporation (MIDC) helps in the promotion of industries both in the private and public sectors by providing feasibility study, raw materials, infrastructural requirements and other financial incentives. Government provides interest-free loans to industry to build their own factory sheds upto 50 per cent of the building cost, repayable in ten years. For technically qualified entrepreneurs, the State Government participates to the extent of 75 per cent in capital investment

(5) *Mizoram*

The entire Territory (except the municipal limit of Aizawal) is eligible for concessional finance from the financial institutions and is also qualified for all the concessions offered by Central Government for industrial development in backward areas including transport subsidy

Mizoram has not made much headway in the industrial sector However, after the formation of the Union Territory, things are changing fast. Industrial plots aretnow available in the industrial estate of Aizawal and Lunglei. Efforts are being made to provide all infrastructural facilities to the constituent units in the estates.

At the state level, the important institution providing facilities for industrial development by way of financial assistance is the State Directorate of Industries which provides loans (i) for creating fixed assets from Rs 2,500 to Rs 20,000 and (ii) for providing working capital upto Rs 50,000 for various industries In addition to loan assistance, the Directorate of Industries assists entrepreneurs in a number of other ways such as registration of small scale units, procurement of scarce raw materials, grants-in-aid in cash and kind, 50 per cent subsidy on tools and machineries and also training of artisans in other States by providing suitable stipend. There is no production tax or sales tax or octroi in the whole of Mizoram

(6) *Nagaland*

All the special incentives provided by the Central Government for setting up industries in selected backward areas and also from the Specialised Financial Institutions as given earlier in this section are available with the entire State of Nagaland.

Factory plots/sheds are available on concessional rent in the industrial estate at Dimapur Industrial estates are also proposed to be built in all important towns in Nagaland. Electricity rates beyond 9 paise per

unit are subsidised for all consumers having electric motors upto 30 HP. The Nagaland Government also offers upto 15 per cent price preference in Government's purchase programmes to small scale units. Detailed project schemes are supplied free of cost or at nominal price by the Department of Industries Loans upto Rs 20,000 are granted by the Department of Industries at 6 per cent interest whereas loans exceeding Rs 20,000 are granted by Assam Financial Corporation which has extended its jurisdiction to Nagaland Grant-in-aid from Rs. 200 to Rs 2,000 are given to deserving cottage units Tax incentives like exemption of sales tax is being considered by the Government

(7) *Sikkim*

The entire State is eligible for concessional finance from the financial institutions and is also qualified for all the concessions offered by Central Government for industrial development in backward areas including transport subsidy.

Basic infrastructure like road, communications, etc., are being made available by the State The State Bank of Sikkim has started the scheme of providing loans for the promotion of agriculture, development of small scale industries and other state development activities. Other incentives are being evolved by the State

(8) *Tripura*

The entire State is eligible for concessional finance from the financial institutions and is also qualified for all the concessions offered by Central Government for industrial development in backward areas including transport subsidy

Three industrial estates have already been developed in Tripura at Udaipur, Arundhutinagar and Kamarghat. Development of another industrial estate is also envisaged at Dharmanagar near the trijunction of Tripura, Cachar and Mizo Hills of Assam The industrial units in the proposed estate would cater for the requirements of a much bigger area. Concessional industrial site, power, financial assistance/loan, marketing assistance, 15 per cent price preference to SSI, etc., are provided by the State to grow industry in Tripura.

GUIDELINES FOR THE GROWTH OF ELECTRONICS INDUSTRY IN HILL AREAS

It has been brought out in the preceding sections that the main reason for the industrial backwardness of the hill areas is their geographical parameters which has a close bearing on the level of infrastructure that is available and that could be made available. The principal objectives of industrial development in India all along have been the regional balance or equitable participation by all regions in the process as well as benefits of development To bring the hill areas at par with the other regions in the country, the Central Government as well as the various Hill States Governments are providing specific incentives to grow the necessary industrial base in the hill areas. Also given in the preceding Sections are the projects initiated by the Central Government and the State Industrial Development Corporations in their respective States

Most of the hill states/areas, it may be noted, are rich in various types of forest, and the economy is mostly agriculture-based. Further, these States are rich in certain kinds of minerals. Therefore, the earlier survey carried out for identifying suitable industrial activities for growing in hill areas by leading financial institutions in the country (IDBI, ICICI, IFCI and others), NIDC amongst others, have mostly suggested those activities which are based on natural resources available in those particular regions. Therefore, such recommendations tend to be in favour of forest-based, mineral-based, agro-based industries, etc. Electronics naturally does not fall under this category In this Section, an attempt is made to suggest some of the areas in electronics which can be grown in hill areas by taking maximum advantages of the incentives provided by Central/State Governments for growing industry in these regions. Also, some suggestions are made for promoting the electronics industry entrepreneurship and awareness

Electronics Activities Identified by Hill Areas

With the incentives provided by the Central Government to grow industry in selected backward areas by way of direct capital subsidy (which covers almost the entire hill areas in north-eastern region with the only exception of North Cachar district in Assam, 75 per cent of the J & K population, and a significant fraction of HP), concessional financial schemes in selected areas (covering almost the entire hill areas) and transport subsidy (also covering almost the entire hill areas) and the incentives provided by State Governments such as concessional land, power and water, soft loans, price preference, sales tax and other tax concessions, technical assistance, etc., it is felt that there are some areas in electronics given below (Category I) which are well within the entrepreneurial capabilities of qualified electronics engineers to grow in hill areas and complete at least in local markets with those manufactured outside the hill areas and brought over there for marketing For the market outside the hill areas, some items which require relatively low technology and are of high cost and low weight have also been identified (Category II). There could also be another category (say, Category III) where electronics items of highly professional nature are included and the investment is also rather high. This would include relatively sophisticated instruments, computer peripherals, communication equipment, defence electronics systems, industrial and control systems. However, decision for locating these type of industries give due regard to the requirements of level of skill and infrastructure demanded by the processes and technologies involved for the manufacture of these items which are fairly high In the following, the discussions are restricted to Category I and III.

Category I

Notwithstanding the lack of elaborate infrastructural facilities, it is felt that the hill areas have a potential to sustain electronics industry in the small scale sector, manned by locally available skills and set up with the basic intention of selling the products in the local market. In view of this, the candidate projects which present themselves are in the sector of consumer electronics, viz., manufacture of radio receivers, cassette tape recorders and TV sets. (For the North-Eastern region there is a possibility of exporting radio receivers to the neighbouring countries, viz., Bangladesh, Burma and Nepal. This should be given a secondary importance—a potential for eventual exploitation.) The manufacture of these items is essentially an assembly operation where the requirement is primarily for the semi-skilled labour. This type of labour force could be trained in about 2-3 weeks period as it does not require any formal

training in the field and manual skills and tricks-of-trade are the key to success. The skilled labour could be drawn upon the trainees passing out of the Industrial Training Institutes and polytechnics with specialisation in the trade of radio/TV technician (given in Section III) The overall co-ordination has, of course, to be done by a qualified engineer which in this case could as well be, the basic qualification for entrepreneurs To bring out the feasibility of growing small scale units in the sector of consumer electronics, some working financial/technical details are given in the following; an estimation of the demand of radio receivers/TVs in hill areas have also been made.

(1) *Assembly of Radio Receivers*

Manufacture of domestic radio receiver is a delicensed item since all the components/raw materials required for it are available indigenously. The requirement of capital goods is also limited and they are all being manufactured in the country Salient features of the capital equipment and component/raw materials requirement for assembly of radio receivers are given below.

Capital equipment: Standard signal generators, oscilloscopes, VIVM, multimeter, winding machines, drilling machines, hand tools, etc.

Component/raw materials: Resistors, capacitors, gang condensers, transistors, diodes, PCB, IF transformers, coils, loudspeaker, ferrite antenna, knobs, band switches, indicator, cabinet, etc The raw material cost in the case of single band radio receiver is about Rs 50 (with about 2"-3" speaker) and for 2-band model is of the order of Rs 80.

For a notional level of production of about 10,000 radio receivers per annum, the requirement of the capital equipment together with the working capital amounts to Rs 200,000.

Manpower requirement : Staff requirement is about 80 inclusive of indirect labour. Of the 30 employees, only about 5 need be of the skilled category.

(2) *Assembly of Cassette Tape Recorders*

For the assembly of this item, the ITC policy allows for imports worth Rs. 40 cif per tape recorder. The major items being imported are tape deck mechanism and condenser microphone. However, with the indigenisation of tape decks, import requirement would substantially reduce. Capital requirement and raw material/component requirements for the assembly of tape recorders are given below.

Capital equipment : Sound level meter, oscilloscope, audio frequency generator, tachometer, multimeter, hand tools

Raw material/components

Imported—(i) Tape deck mechanism

(ii) Condenser microphone

Indigenous—Transistors, resistors, capacitor, PCB, speaker, transformer, cabinet, wires, mechanical components, metallic hardware, etc.

The total cost of components for a cassette tape recorder is estimated to be Rs. 350 For a notional capacity of 5,000 cassette tape recorders per annum, the total investment is estimated to be about Rs 700,000.

Manpower requirement : Total manpower required for the above-mentioned level of production is about 35 persons of which only 5 to 7 need be skilled, the remaining being either semiskilled/unskilled or the clerical staff.

(3) *An Estimate of the Demand of Radio Receivers/TVs in Hill Areas*

In order to provide guidelines to the entrepreneurs for the numbers of radio sets/TVs which are likely to sell in hill areas, a first order analysis of the demand in the hill areas has been carried out. It is described regionwise below.

North-Eastern Region

The North-Eastern Region which consists of the States of Arunachal Pradesh, Assam, Manipur, Meghalaya, Mizoram, Nagaland, Tripura and Sikkim is largely covered by the primary service of one channel only. Currently, radio transmitters are located at Gauhati, Shillong, Kohima, Imphal, Dibrugarh, Silchar, Passighat, Tezu, Aizawal, Tawang and Itanagar. Low power transmitters which operate on different power, during day and night are 8 in Assam, 8 in Arunachal Pradesh, 5 in Manipur, 3 in Nagaland, 2 in Meghalaya, 2 in Mizoram and 3 in Tripura.

With the completion of some of the schemes now in progress, it is expected that 90 per cent of Tripura, Arunachal Pradesh and Mizoram would be covered.

The total population of the north-eastern sector is estimated to be about 20 million of which only about 10 per cent is urban. The number of licensed radio receivers stood at 200,000 as in December 1975, amounting to one set per 20 families and is amongst the lowest in the hill areas. Through promotional efforts a demand of about 40,000 sets/annum could materialise, and about 5-6 units in the small scale sector could easily be sustained.

(4) *Ancillary Units*

Once the electronics units suggested under Category I go in operation, there may be a necessity to grow ancillery industry around such units. These would require units to manufacture transformers, chokes, coils, knobs, chassis, cabinets, nut, bolts and screws, telescopic aerials, electroplating and polishing units As the necessary infrastructure would be available at the industrial estates planned in the various states, setting up of these ancillaries may not be a problem Once the demands of Category I items pick up, it may be possible to manufacture gang condensers and loudspeakers to cater for the local manufacturing units and eventually to units operating outside hill areas.

Category II

In this category, an attempt has been made to identify those electronic items which are essentially assembly type, do not require high skill or large investments and at the same time are high-cost, low-weight items. With the incentives provided by the Central and State Governments including transport subsidy, it may be possible to take advantage of their relatively high-cost and low-weight nature and compete with other manufacturers elsewhere even though the local demand may be relatively low. These items may require access to elaborate testing facilities which could probably be provided by the Centre as proposed later in this report. Such items include, (i) multimeter—analog as well as digital type, (ii) panel meters for various applications, (iii) hearing aids. (iv) pocket calculators, and (v) other items which require similar type of assembling and testing operations.

Current Status of Electronics Industry in Hill Areas

In the north-eastern region, there is hardly any electronics unit which is operating at present. Recently, the Government of Meghalaya has decided to set up an electronics industry (radios and tape recorder) at Shillong. Other projects are also being attempted in Meghalaya. Assam Government has also set up a board to draw up projects and prepare feasibility studies specifically for electronics items. As for the availability of trained manpower, the engine-

ering colleges at Jorhat and Gauhati are offering electrical engineering courses which include some aspects of electronics Radio & TV mechanics are available from the ITIs based at Gauhati, Manipur, Nagaland and Tripura as discussed in Section III of the report.

The engineering college at Srinagar is also training engineers in the areas of electronics

Need for Forest Instrumentation and Service Centre

Forests have a prominent role in maintaining the ecological balance The percentage of forest area in the country, which is about 23, is rather low compared to most of the countries in the world. The National Forest Policy, revised in 1952, lays down that the area under forests be steadily raised to 33.3 per cent of the total geographical area Moreover there is a need to monitor the growth of these forests, which in no case should be left to itself. It is apparent that under natural forest conditions, trees that survive and reproduce themselves are those that are best suited to compete and reproduce under the local natural environment. Though these trees are good competitors, they are often not the most desired. In an intensively managed forest, less emphasis is placed on the ability of trees to survive and thrive under unfavourable conditions and enough thought is given to the qualities and economic value of the product that is grown As the hill areas are to a large extent covered by forests, they are the potential centres where units could be set up to monitor and harness the forest wealth The fraction of the geographical area in various hill states covered by forests is summarised in Table 3 As electronic instruments can play a vital role in (i) assisting to monitor the growth of forests, (ii) measurement of parameters connected with soil, (iii) measurement and control of aerial environment, etc, it is felt that on an experimental basis a "forestry instrumentation laboratory and service centre" may be set up in the state which have dense forests of economic value. This unit could later on take up custom manufacture of these instruments and subsequently, if economically viable, take up their manufacture as well. The various electronic instruments which may find use are temperature measuring, humidity, soil water content, salinity meters, seed testers etc.

The proposed centre or similar body should also be set up in the northern hill areas like Himachal Pradesh and Jammu & Kashmir.

APPENDIX I

Concessional Finance by Industrial Development Bank of India, Bombay

Assistance on Concessional Terms to Industrial Projects in Backward Areas

(1) IDBI has recently reviewed its concessional direct assistance schemes It has decided to extend concessional rupee loan assistance upto Rs 20 million and underwriting assistance upto Rs 10 million in participation with other term financing institutions (IFCI and ICICI) to new concerns setting up projects in specified backward areas, irrespective of their product cost The assistance in excess of the above ceiling would generally be extended on normal terms, though exceptions may be made in special circumstances on the merits of each case.

(2) Concessional finance for expansion/diversification projects in identified backward districts undertaken by existing concerns would be considered on selective basis, keeping in view the profitability potential of the existing and proposed new projects, location of new projects and other related factors

(3) Concessional loans will carry interest at 9 5 per cent, as against the normal lending rate of 11 per cent per annum The rate of underwriting commission in respect of concessional underwriting would be 1.25 per cent, as against the normal rate of 2.5 per cent.

(4) Concessional financial assistance was hitherto available generally to new projects involving capital cost upto Rs 30 million and to expansion/diversification scheme of existing units with total investment (i e net fixed assets plus net working capital of the existing unit and cost of expansion project together) upto Rs 30 million Under the present liberalisation, new projects which involve capital cost of more than Rs 30 million would also get the benefit of concessional assistance upto Rs 20 million for loans and Rs 10 million for underwiting.

(5) The IDBI also extends concessional refinance assistance at 6 per cent in respect of all eligible loans of SFC, and banks upto Rs. 3 million to small and medium sized projects in the specified backward areas, provided the paid-up capital and reserve of the assisted industrial concerns do not exceed Rs. 10 million and the primary lending institution does not charge more than 9.5 per cent.

APPENDIX II

Concessional Finance by Industrial Finance Corporation of India, New Delhi

The Industrial Finance Corporation of India (IFCI), in supersession of its earlier announcements made in July 1970 and January 1972, has decided to liberalise and enlarge the scope of the scheme of financial assistance on concessional terms to industrial projects in such areas. The scheme would now cover all industrial projects—new, expansion or rehabilitation—in the corporate as well as cooperative sectors, irrespective of their capital cost, the principal features of the revised scheme of concessional finance for units in identified underdeveloped districts/areas would be as under.

(1) *Location*

All industrial projects located/to be located in the districts in the various states or union territories selected for such assistance by the Central Government from time to time would be eligible for assistance on concessional terms.

(2) *Scope of the Scheme*

Concessional finance would be extended to all projects—new and expansion—both in the corporate (limited companies) and cooperative sectors. Concessional terms would also be made applicable to assistance granted by IFCI by way of rehabilitation finance to units located in notified underdeveloped districts on the same basis as applicable to new and expansion projects

(3) *Ceiling on Assistance*

The overall ceiling in respect of rupee loans on concessional terms from IFCI individually, unless other institutions also participate and extend concessional finance upto Rs 20 million on a prorata basis, would be Rs 10 million. The sum of Rs 10 million would, however, include outstanding rupee assistance, if any, already on concessional terms. Underwriting assistance from the term financing institutions including IFCI would be made available at concessional terms upto a ceiling of Rs. 10 million in the aggregate, irrespective of the cost of the project.

(4) *Terms*

(i) Rate of interest: As against the normal current rate of interest at 12 per cent (with a rebate of 1 per cent for punctual payments of instalments of interest and princi-

TABLE 3

Forest wealth of some hill areas

States/Union Territories	Total area (sq. km)	Area under forest %	Principal forest products
North-Eastern			
1. Arunachal Pradesh	83,578	72 9	Bamboo, pine.
2. Assam	78,523	21 7	Timber, bamboo, reeds, medicinal herbs, lac, cane, etc
3. Manipur	22,356	36 8	Timber, bamboo, cinnamon.
4. Meghalaya	22,489	NA	NA
5. Mizoram	21,087	20 0	Timber, bamboo, cane, agar.
6 Nagaland	16,488	17 6	Timber
7 Sikkim	7,299	33 0	Sal, conifer
8. Tripura	10,477	60 0	Bamboo
Northern			
1 Himachal Pradesh	55,673	38 3	Timber, fuel wood, gums, resin
2 Jammu & Kashmir	2,22,236*	17 0	Timber, fuel wood
Total	32,80,483	22 7	

**Source* : India 1976 (A Reference Annual).

pal,) a lower rate of interest i e 10.5 per cent (with a rebate of 1 per cent) would be charged on loans to eligible industrial projects in backward areas

(ii) Period of repayment of loans: IFCI's normal practice is to allow initial moratorium upto 3 years to an assisted concern before the repayment of the principal amount of the loan commences. In the case of undertakings in the underdeveloped areas, this period would be extended upto five years from the date of first disbursement of the loan, on a case to case basis, having regard to the projections of profiability and ways and means position of a concern. Likewise, against the normal period of 10 to 12 years allowed for repayment of loans, the period in the case of projects coming up in underdeveloped areas may be extended upto 15/18 years on the merits of each case having regard to the concern's profitability potential and cash flow position.

(iii) promoter's contribution and equity, debt ratio: A lower contribution than the usual by promoters to the total project cost and somewhat liberal equity debt ratio would be considered on the merits of each case having regard to the financial status and standing of the promoters' gestation period of a particular project, its profitability potential and other relevant factors.

(iv) Participation in equity and preference capital: Depending on the merits of each case, IFCI would be prepared to consider participation by way of underwriting or otherwise in the share capital of an industrial concern located in underdeveloped areas to a greater extent as compared to projects located elsewhere.

(v) Reduction in other charges: Fifty per cent reduction would be made in IFCI's normal charge in respect of underwriting commission commitment charge, non-refundable examination fee for processing of applications and legal charges.

APPENDIX III

Concessional Finance by Industrial Credit and Investment Corporation of India Limited

Concessional Terms for Assistance Provided by ICICI in Backward Regions

(1) Rupee loan assistance to new concerns for projects in specified backward districts will be made available at a concessional rate of interest of 9.5 per cent and commitment charge of 0.5 per cent upto a ceiling of Rs. 20 million of the total term loans provided by the IDBI, IFCI and ICICI, irrespective of the cost of project. The concessional rate of interest for foreign currency loans (within the limit of Rs. 20 million) is 9.5 per cent. Loan assistance above an aggregate of Rs. 20 million will be made available at normal rates.

(2) Underwriting assistance to new concerns for projects in specified backward districts will be made available on an underwriting provided by institutions, irrespective of the cost of product. Underwriting assistance above an aggregate of Rs. 10 million will be made available on normal terms.

(3) The distribution of the loan and underwriting assistance on concessional terms amongst institutions would be made within the above limits on a case to case basis.

(4) Relaxation regarding debt equity ratio, initial moratorium and repayment period for projects in specified backward districts be considered on a case to case basis.

(5) Concessional finance for projects in specified backward districts to be set up by existing concerns by way of expansion/diversification will be considered by the institutions on selective basis. ❑

Yojana Quiz

1. The first government telegraph line was opened in 1851 between
   (*a*) Calcutta and Delhi
   (*b*) Calcutta and Bombay
   (*c*) Calcutta and Diamond Harbour
2. Who are the authors of the following books
   (*a*) Glimpses of World History
   (*b*) Kim
   (*c*) Raghu Vamsa
   (*d*) Gora
   (*e*) Wasteland
3. What is Light Year?
4. How is it that food gets cooked quicker in a pressure cooker than in an ordinary vessel?
5. Why water gets cooled in earthen pitchers?
6. Longest river in the world is
   (*a*) Missouri-Mississipi
   (*b*) Congo
   (*c*) Nile
7. Largest island in the world is
   (*a*) Greenland
   (*b*) Great Britain
   (*c*) New Guinea
8. The only one lead smelter in the public sector in India is at
   (*a*) Salem
   (*b*) Calcutta
   (*c*) Tundoo
9. Where does one come across with the following dances in India?
   (*a*) Thutotdam
   (*b*) Sanjenba
   (*c*) Kuravanchi
   (*d*) Bhangra
10. The Legislative Council of Arunachal Pradesh was inaugurated on
   (*a*) 26 Jan 1975
   (*b*) 15 Aug. 1975
   (*c*) 2 Oct. 1975
11. Where was the 33rd World Table Tennis Championship held and in which year?

ANSWERS

1. (*c*) Calcutta and Diamond Harbour. 2 .(*a*) Jawaharlal Nehru, (*b*) Rudyard Kipling, (*c*) Kalidas, (*d*) Rabindranath Tagore, (*e*) T.S. Eliot
3. It is an astronomical measure of distance, i.e the distance travelled by light in one year.
4. The boiling point of water (or any other liquid) depends upon the pressure on its surface. Steam produced inside the cooker builds up pressure, thereby raising the boiling point of water, which results in quick cookin g. 5. Water evaporates through the pores of the earthen pitchers. The heat energy required for the evaporation process is taken from the water molecules. Thus the temperature of the water is lowered 6. (*c*) Nile - 4,000 miles. 7. (*a*) Greenland - area 827,300 sq. miles. 8. (*c*) Tundoo (Bihar) - based on the Zawar ore deposits

9 (*a*) A Mask dance in Tawang area in Arunachal Pradesh, (*b*) Popular dance opera of Manipur, (*c*) A dance drama of Tamil Nadu with Bharat Natyam as the base, (*d*) Harvest dance of the Punjab. 10. (*b*) 15 Aug. 1975. 11. The 33rd World Table Tennis Championship was held at Netaji Stadium, Calcutta in February, 1975.

Justice is the very condition of human survival Its denial will be an invitation to violence

* * *

Those who produce and exchange industrial goods must learn not to do violence to the balance of nature and balance of the human being.

—Indira Gandhi

* * *

No culture of any society can remain isolated That is why there are always new frontiers of study for archaeologists and anthropologists. Even before the advent of writing, cultural interchange was occurring on a scale that defies the imagination of modern man. It is the impact of continuing external stimuli, the influence of some degree of cultural interchange that has caused the culture of every society in every age to develop.

—Chie Nakore in Monthly Digest on Japan

Psychology of Freedom

Books

The Psychology of Freedom by Krishna Chaitanya : *Somaiya Publications, New Delhi* . (*Pages XIII+348 Price* · *Rs 75.*

HUMAN THOUGHT HAS for centuries been dominated by a materialistic metaphysic, largely based on classical physics In this metaphysic all reality is corpuscular and all change mechanical. It does not admit purpose or telos as an ontological category but views it as a merely contingent phenomenon with no casual importance.

Recently however many sensitive minds have come to question the validity of this metaphysic, as much for its failure to explain the many new dimensions of reality revealed by science as for the cramping effect it has on human initiative. In his five-volume magnum opus Krishna Chaitanya attempts to survey and sum up this vast and beneficient change in human thinking. No greater tribute can be paid to this, the third volume in the series, than to say that it is a worthy successor to the two earlier volumes

Krishna Chaitanya continues here his sustained campaign against mechanomorphism He shows how Polanyi, Chardin, Chomskey, Maslow and other outstanding modern thinkers confirm and clarify the insight of the Upanishadic seers that reality is dynamic and that the principal driving force in nature, the principal agent of change, is "freedom" or internal determinism—a kind of teleonomy or imminent causality—and that this is true as much of inorganic material systems as of man, as much of subatomic particles as of the cells in the neocortex.

Developing this *weltanschauung* in a comprehensive and ambitious project encompassing a wide variety of disciplines, Krishna Chaitanya here establishes his Philosophy of Freedom on modern psychology, having already dealt in earlier volumes with physics and chemistry and biology.

Psychology, as a science, is of comparatively recent origin. In fact it was not until the last quarter of the nineteenth century that Wundt, William James, Titchner, Fechner and Helmholtz thought of applying laboratory techniques to the study of mental phenomena It was only to be expected that in its early stages it should reflect the temper, the predilections and prejudices peculiar to the age that gave it birth, which was an age of 'determinism', of causal laws of eternal and universal applicability

In the present work Krishna Chaitanya critically examines the chief deterministic formulations in psychology and demonstrates, by compelling argument supported by evidence from innumerable workers in the field, that these formulations, besides being counter-productive, are unfounded in fact in their premises and unwarranted in their conclusions. Krishna Chaitanya's commitment is to freedom. He however does not start with the postulate but presents it as a colligative and conclusive judgement.

In his voyage into the psychology of freedom, the author comes up first against the Associationists and Behaviourists, the Parallelists and Epiphenomenalists, who hold either that there is no mind and no consciousness or that these are quite independent of the body, so that between mental events and neural events there may be some correspondence but no causal relation.

As against these schools Krishna Chaitanya affirms that the self, mind and consciousness exist; that consciousness is not a substance but a function—a function of the brain and the nervous system as a whole and not of this or that part of the structure, as has been proved by the experiments of Sperry, Penfield and others in such disorders as aphasia, alexia and agnosia; that the totality of the working all neural structures is the mind and that the integrating principle behind the workings of thought, its nuance and colour and the very sense of its intentionality, is due not to the neural pattern of which it is a function but to "an integrating, intending self." It is the self that "reads the meanings signalled in by the external world through the sensory channels" and integrates them "to drive towards a fresh reach of meanings and values".

As against Watson, Skinner and others for whom psychology is no more than behaviour, which itself is no more than the organism's reaction to environment, even thought being merely subvocal speech, a function of the vocal chords, the author shows that behaviour, especially in its higher reaches, is organised, directional activity, involving motivation, reasoning, decision making This is true of behaviour even at the reflex level. In man it is also influenced by memory and anticipation and thus spans a time segment. It further involves the whole of the organism as a unity and is molar, not molecular, in structure as Tolman and various other researchers have conclusively demonstrated

Krishna Chaitanya has devoted much space to a critique of the theory of psychoanalysis. He acknowledges Freud's great contribution towards an understanding of the psychical processes involved in mental illness and abnormal behaviour, but he points out that psychoanalysis, based on nineteenth century physics, is a closed system, essentially deterministic and pessimistic; that useful as it has been in therapy and in clarifying the workings of the mind at the appetitive level, it provides no help in understanding the higher psychisms operating at the ideational level. The basic fallacy of Freudian thought lies in its postulating the unconscious as the prime determinant of character and behaviour in man and in its regarding the human situation as one of conflict: conflict between the instinctual drives—dark, violent and quite beyond reach except when and to the degree made accessible by analytical therapy—seeking expression and fulfilment and the system of checks and taboos devised by social culture. It is thus a case of the mind confronting the mind and not one of the mind confronting the environment, and what essentially are instances of maladjustment and dysfunction are raised to the status of governing principles.

But the outlook is no longer as grim as it used to be. The Gestalt, the Phenomenalist and the Existential schools of psychology, for instance, totally deny that the unconscious plays the role that Freud assigns to it. They refuse to regard man as an arena of perpetual conflict between libidinal forces and the ego organization. They insist that man is primarily a being, system of *potentialities* that are struggling for actualization, and that it is this conatus for the realization of his possibilities, for becoming other than what he is, for overcoming and transcending himself at each step, that is the decisive element in the dynamics of the mind. This of course argues freedom of choice between alternative courses of behaviour, operation of volition of *liber arbitrium*. And that is the point that Krishna Chaitanya makes.

But if freedom is a reality, if the ego is an autonomous energy system, it goes without saying that it has a much greater role in sickness and health than has been conceded to it by reductionist psychological theories. A large share of the responsibility for dysfunctions and abnormalities of all kinds that have so far been regarded as the area of manipulative therapy thus comes to rest with the individual. The unconscious is a force from the past and, unless the ego chooses to throw up the sponge, there is no reason why the past of a man should imprison not only his present but also his future. This has a further implication. A man will be what he makes of himself.

This making something of oneself, this perpetual exploring of possibilities in a field of value systems, this pursuit of what Maslow calls "being needs" as contrasted with "deficiency needs" is the key factor in the understanding of man as man.

One may legitimately expect this massive work to bring about far-reaching changes in psychological thought, for the writer is an outstanding scholar and thinker who combines encyclopaedic erudition with the insight of a seer

—J.P. Uniyal

Emporium of Trade

Surat and its Trade in the Second Half of the 17th Century *by Dr. O.P Singh, University of Delhi*, 1975; *Pages VIII* + 223; *Rs* 50.

THE ECONOMIC history of the West Coast of India during the last three centuries has always been a field of special interest to historians in India and abroad. Whereas a good deal has already been written about the operations based on Malabar Pepper trade, the story of trade links with Surat had remained to be studied. This doctoral thesis of 1964 has appeared never too late to enable interested scholars in piecing together the story during a crucial period of contact with European Colonial powers.

As a study in depth, the author has concentrated on the activities of the English, Dutch and the French in Surat and delineated the economic conditions that prevailed during the period 1650-1700 A.D. He has credited the Mughals with a high degree of skill in playing one European power against another in ensuring safe passage to the pilgrims proceeding to Mecca. Those who are familiar with the activities and internal interferences of the European factors in Kerala principalities during this period and subsequent decades cannot fail to attest the painstaking amount of research that has gone into the writing of this thesis. However, they would all the same be disappointed at the lack of larger perspectives in the treatment of the subject embracing Surat-based activities on the West coast and across the ocean to African countries. There is also lack of sophistication in arriving at historical deductions Economic history can hardly be delimited to a bland narration of facts or presentation of other's views It will be readily admitted that this requires also a synthesis, apart from an imaginative involvement with the events of the past as were enacted in a milieu different from that of the writer himself. This shortcoming is patent due evidently to the lack of acquaintance betrayed with the interpretive studies that have already appeared on colonial history. However, while as a focussed study it retains its definite value with a good coverage of source materials, as a doctoral thesis both its reasoning and analysis of facts, are palpably weak and inadequate

Finally, it is not perhaps out of place to comment that the writing of economic history has increasingly become an interdisciplinary effort and in this respect interuniversity collaboration is an essential postulate for its success. While University of Delhi deserves compliments for publishing this thesis, both the author and his readers might have benefited through this process The book might have also shed light on the migration and Surati Muslims and Hindus to East Africa, Madagascar and Zanzibar It is to be hoped that the author himself would come out with a fresh study on the subject before long

—B.N. Nair

Principles of Foreign Exchange

Foreign Exchange : Principles and Practice *by K K Andley; Sultan Chand and Sons; New Delhi* 1976; *Pages* 462; *Rs* 16.

A BOOK WITH 492 pages (including 12 pages of contents etc) with 97 tables and/or tabular calculations, composed in various points of letters would certainly not have been available for just Rs 16.00 had the publishers not got the printing paper at a concessional rate from the government under the new economic programme.

The book is popular and has already proved its usefulness among the students It is evident from the fact that almost every year a new edition has been brought out (first edition was published in February 1971 and the fourth one in 1976). The author, as he himself has admitted in the preface, has done a lot of alteration and additions to make the book comprehensive. He has compiled information on various rules and regulations governing foreign trade. He has tried to make it as uptodate as possible.

The book is divided into five parts. Each part deals with the main department of foreign exchange and

various principles involved in it. First part deals with foreign trade and foreign exchange. This is further divided into sub-parts. These contain everything about foreign trade and international payments; means and methods of international payments; theory of foreign exchange, fluctuations in foreign exchange rates; foreign exchange transactions; foreign exchange maxims and terminology; forward exchange; forward exchange markets; foreign exchange markets, exchange control and other policies Second part contains descriptions of international institutions and agreements like the International Monetary Fund; International institutions and agreements like the International Monetary Fund; International Bank for Reconstruction and Development, General Agreement on Tariffs and Trade (GATT) United National Conference on Trade and Development (UNCTAD). Various international monetary problems have also been dealt with in this part of the book. The latest among the crises the Oil crisis and petro-dollars have been well explained The problems relating to Indian foreign exchange have also been dealt with. Financial facilities for promotion of export trade of India have been dealt with in detail in the fourth chapter of this part. Part three deals with various functions of the foreign exchange departments "of the commercial banks; various documents and their format have been explained in a total of five chapters of this book. Part four delas with only one aspect i.e. current exchange and trade control in India. Part five relates to this Exchange Arithmetic wherein solved examples for calculations of various values required in foreign trade have been demonstrated.

The questions at the end of each chapter and the hints where the correct answers to the questions could be found in the book is a sort of spoon-feeding for the students It would have been better if the stuents were left to find them out at the proper position of the chapter.

Except a few printing mistakes the overall get up of the book is good On the whole it is a useful book from the point of view of the students as well as the layman

—**Dr. M. M. Mathur**

Future Trading

Economics of Hedging, : by M.V. Pavaskar *Popular, Bombay,* 1976; *Pages xii — 144; Price Rs.* 30

THE IMPORTANCE of futures trading arises mainly from the function of risk-avoidance it is said to perform Market mechanism involves risks of adverse price fluctuations, particularly in agricultural commodities which are harvested seasonally while they are consumed, and therefore marketed, round the year. The futures market device was evolved to avoid and minimise such price risks—hedging is the process through which price risks are avoided or reduced.

However, the author of the book does not labour under any illusion The concept of heding as well as hedging practices of trade and industry are not static, rather they change from time to time according to the exigencies of economic and technological developments.

It is now widely recognised that different market functionaries use market mechanism for manifold hedging purposes depending on their objectives and economic influences affecting their trades. Hedging operations are, therefore, never uniform for all who enter futures market.

Typical illustrations of hedging hypotheses claim that hedges aim at minimising price fluctuation risks, and that price movements in both ready and futures markets are similar in both direction and magnitude. In other words, the combined outcome of both ready and and futures transactions in a hedge is zero—neither profit nor loss to the hedger. However, in practice, the correlation between the ready and the futures prices is never unity. Thus, although most hedges reduce risk of price fluctuations, they scarcely eliminate them altogether Rather, when correlation is negative, the risk is, in fact, increased. Consequently, a hedge ceases to be a risk eliminator; on the other hand, it becomes more risky

Holbrook is more critical of the concept of reduction of risk through hedge. While claiming that empirical studies have disproved this traditional concept, he replaces it by a more meaningful multipurpose concept of hedging He defines it as 'the use of futures contract as a temporary substitute for merchandising contract without specifying the purpose'

The book is a study of hedging practices in the cotton futures market of Bombay and covers a period of eleven years from 1953/4 to 1963/4. Though apparently looking quite old and not of much relevance, the period is not in fact so old in view of the fact that cotton futures market was suspended in 1966 and remained so ever since upto this day. Obviously, there was no scope for updating the study.

However, the advocacy by the author of the institution of future market as a strong bulwark against malignant development of oligopoly or oligopsony in free market conditions looks neither justified nor convincing In reality it is the other way round, and it is mainly because of this that a check has been put on futures trading The ban is fully justified.

In any case, the analysis is compact and at the same time lucid. The book has, however, been priced rather high looking to the quality of production can hardly be said flawless.

Development Notes

More Oilseed Complexes in Co-op Sector

Fifty new oilseed complexes are proposed to be set up in the co-operative sector in different states in the next five years. The new units will have a total capacity of eight lakh tonnes of different types of oilseeds. The total capacity of the existing oilseed complexes (installed as well as under installation) is five lakh tonnes or about 4 per cent of the total oilseed crushing capacity in the country. With the addition of eight lakh tonnes to the existing capacity, the co-operative sector will account for 10.8 per cent of the oilseed crushing capacity in the country

Production of oilseeds went up from 9 05 million tonnes in 1973-74 to 10 34 million tonnes in 1975-76 It is estimated that during 1976-77 production will be at the same level as last year

Programme to Step Up Oil Production

The joint sector Oil India Ltd. has drawn up a programme to step up its crude oil production by an additional 50,000 tonnes a year and maintain such production till about 1990. At present the OIL, produces 3 09 mullion tonnes of oil per annum, from its fields in Assam. According to OIL sources, the basis of this optimistic prospect is the discovery of oil in Jorajan, where oil was found in almost all wells drilled. The company plans to drill a number of developmental wells in this area

The OIL is pinning high hopes on its exploration activities in Arunachal Pradesh The organisation holds exploration rights in a small area in the Union Territory. It has already drilled four exploratory wells in Arunachal Pradesh Oil in reasonable quantities has been found at a shallow depth in Kharsang Three, drilled adjacent to Kharsang Two

Smokeless Domestic Fuel

The country's first smokeless domestic fuel named as 'Jwala' will be available for commercial marketing from January 1, 1977. The price will be around Rs 12 for 40 kg. Coal India has taken up various projects to increase production of this fuel. The plant at Kusunda with a capacity of 100 tonnes a day has started commercial production Sawan palletisation plant will go on stream very soon and its rate of production will be five tonnes an hour Commercial exploitation of proved processes of low temperature carbonisation has been made The Dankuni plant with a capacity of 13 million cubic feet of domestic gas and 1,000 metric tonnes of medium coke per day has already started The plant which is being erected, will be ready by 1979

REC Aid for Tamil Nadu Projects

The Rural Electrification Corporation has sanctioned a loan exceeding Rs 3 4 million for three new projects for the extensive electrification of 77 already electrified villages in Tamil Nadu.

The projects will be located one each at Marangapuri block in Thiruchirapalli district and Alwarthirunagar block in Tirunelveli district. When completed in two years, these will help energise 400 pumpsets in 16 villages.

The third project will be situated at Orathanad block in Thanjavur district. It is the sixth REC-assisted project in the district When completed in five years, it will supply power to 200 pumpsets and 33 small industries in 61 villages This apart, 1,650 domestic and commercial connections and 600 street lights will also be provided in the project area

REC has so far sanctioned loan assistance exceeding Rs 210 million for 71 projects to cover 2,800 villages in the state. When completed, these will energise 54,400 pumpsets and 1,900 small industries. Besides, more than 1.34 lakh electric connections for domestic and commercial use and 22,700 street lights will also be provided in the state

Milk Chilling Plant to be Set Up

A cattle feed mixing plant having an installed capacity of manufacturing 100 tonnes of fodder per day, a semen bank, an input centre and a chilling plant of 10,000 litres of milk per day capacity will soon be set up in Bharatpur district by the District Milk Producers' Union. Funds for this purpose will be made available under "Operation Flood" project

The marketing of milk and technical inputs will be carried on by the Rajasthan State Dairy Development Corporation through this Union.

The Dairy Development Corporation has already located the site at Nadbai for the fodder mixing plant. The union will provide veterinary aid, artificial insemination facilities, balanced cattle fodder and seeds of improved fodder to milk producers who are members of co-operatives.

Three Joint Sector Units in Rajasthan

Three units involving an investment of about Rs 56 million will start production in *joint sector in Rajasthan in* the next financial year

The first lot of five scooters from Rajasthan Industrial and Mineral Development Corporation owned factory in Alwar has already come out Another 50 scooters are already in assembly line and will role out for sale next year, 500 more will be available in March

The company's another own venture has produced 250 TV sets in Jaipur which will be handed over to ECIL for sale as per an agreement The Corporation is also examining the *possibility of producing* Janta TV sets which may not cost more than Rs. 1800

The three projects in joint sector expected to start production are the glass lamps and shells project at Alwar, synthetic textile unit at Banswara and the granite polishing factory at Jalore. The investment in the first and the last will be Rs 10 million each while in the Banswara unit it will be Rs 36 million

Pipes Unit Overfulfils Target

Rourkela Ispat has already fulfilled the annual target of producing 36,000 tonnes of electric resistance welded pipes with over three months still on hand

The cumulative production of ERW pipes amounted to 36,044 tonnes in December This means a monthly production of 4,157 tonnes against 3,245 tonnes a month achieved in 1975-76, representing a growth rate of 28 1 per cent

ERW plant at Rourkela meets the requirements of pipeline project of petroleum industries

Mango Kernel as Big Exchange Earner

Mango Kernels, which are usually cast away, are fast turning out to be a substantial foreign exchange earner

The kernel yields oil which fetches as much as Rs 12,000 a tonne abroad, and the pulp after extraction sells at Rs 550 a tonne

The boom follows its use as a substitute for cocoa butter by the chocolate manufacturers

The Government is making a serious effort to develop this item of export, as also malt which too has a substantial export potential

It had arranged for the export of some barley for the first time this year with good results

Hybrid Coriander Seed Evolved

Scientists of the Central Indian Medicinal Plants Organisation (CIMPO), Bangalore, have successfully evolved a new hybrid variety of coriander seed

This improved 'CIMPO-38, the result of five years of intensive selection from Bulgarian material introduced in the Bangalore experimental farms, will give about three times higher yield. Its oil content is about seven times more than that in the local variety

Coriander is grown in Tamil Nadu, Andhra Pradesh, Maharashtra, Madhya Pradesh and Rajasthan in a total area of over 2,62,000 hectares

According to the CIMPO here the country had exported 743 tonnes of coriander seed valued at Rs 3.29 millon during 1975-76 as against 669 tonnes valued at Rs2.79 million in 1974-75.

Cement Plant Begins Work

A new cement factory of the public sector Cement Corporation of India, at Bokajan in the Mikir hills areas of Assam has gone into trial production ahead of schedule It is proposed to produce in the factory special type of oil well cement and sulphate resistant cement, which would save the country foreign exchange to the tune of about Rs 20 million a year. About ten thousand tonnes of this type of cement is being imported now for the expanding oil drilling industry at a cost of Rs 1700 per tonne

Another new project, at Rajban in Himachal Pradesh is in an advanced stage of construction. Sixty to 70 per cent of the machinery has arrived and the project is expected to be commissioned by the end of 1977.

Including Bokajan and Rajban, the Corporation had taken up two more projects in 1977-78.

Namrup Keeps Up Output Growth

The Namrup Fertiliser Factory has kept up its production curve by registering an increase of 5 6 per cent during April 1976. The increased production stood at 29,120 tonnes of nitrogen against 27,560 tonnes during the corresponding period of 1975

The Namrup Fertiliser Factory, designed to produce 45,000 tonnes of nitrogen in the form of urea and ammonium sulphate, went into commercial production on Jan. 1, 1969.

During 1975-76, the Namrup unit produced 102 per cent of its installed capacity. Its urea plant surpassed the installed capacity for the second successive year. In the form of nitrogen it has produced 45,352 tonnes against the installed capacity of 45,000 tonnes

The Namrup expansion which is designed to produce 1,000 tonnes urea a day, went into commercial production on Oct 1, 1976.

Record Output of Titanium Pigment

The Travancore Titanium Products (TTP), the largest Kerala Government undertaking has achieved a record production of nearly 10,000 tonnes of titanium pigment during 1976

According to a review on the working of the company 1,000 tonnes of this production were exported earning Rs 40,00,000 in foreign exchange The highest annual production so far was 7,611 tonnes

During the year about 1,200 tonnes of rutile were produced

Cochin Shipyard to Build Carrier

The Cochin Shipyard signed a contract to build a big bulk carrier for the Chowgulf Steamships Limited.

This is the third "panamax" type 75,000 tonne vessel, the biggest type to be built in the country The first two such ships are on orders by the Shipping Corporation of India and the Ratnakar Shipping Company

The Cochin Shipyard went into production early this year

Beas Power Project on Stream

The Haryana State Electricity Board's Rs 1 50 crore new power project under Beas Power Development Programme has been commissioned The new 132 kv sub-stations and 25 km transmission lines have been constructed and energised The installed capacity has been raised from 37 to 56 mv to meet the increased need of tubewells The Board has completed the project in advance for utilising Beas power It will get power from 400 kv sub-station at Panipat, the highest kv rating sub-station in northern region

Four-Fold Rise in Scooter Export

A four-fold increase in the export of India-made scooters was recorded in 1975-76 when an estimated 12,000 scooters were exported at a value of Rs 36 million The export trade in the previous year was a little less than 3,000 scooters valued at Rs 7.10 million

Production of scooters in India was of the order of 97,300 scooters in 1975, as compared to 86,000 produced in 1974 and a little over 78,000 in 1973

There are eight manufacturers engaged in the manufacture of scooters with a combined capacity of 315,000 numbers per year. Besides six more units are likely to commence production soon with an additional capacity of 144.000 per cent.

Onshore Oil Potential

The on-shore oil potential in India by next year will be slightly in excess of 6.5 million tonnes per annum or an increase of 60 per cent over the previous levels as a result of substantial efforts made by the Oil and Natural Gas Commission.

Drilling activities in West Bengal, Himachal Pradesh, Uttar Pradesh and Andhra Pradesh are being activised during the current year

Two drilling rigs were currently operating in Tripura and operations there would be further intensified by two more rigs in the current year.

Production had been stabilised around four million tonnes in 1974 which was gradually stepped up to 5.2 million tonnes in 1975-76.

While the additional fields. were being developed in the eastern region, the western region in north Gujarat would enable ONGC to sustain production at an annual rate of over four million tonnes for some years against the production level of five million tonnes in the eastern region.

The additional production would be adequate to meet the requirements on Bongaigaon refinery now under construction.

The Commission was currently deploying 18 geological field parties, 26 seismic survey parties, and three gravity magnetic parties on-shore.

Germplasm Collection by ICRISAT

One of the biggest collections of germplasm to help plant breeders working for rainfed areas in Asia and Africa has been acquired by the International Crops Research Institute for the Semi-arid Tropics (ICRISAT), located in Hyderabad

The institute has assembled so far 21,000 lines of jowar, (sorghum) about 4,000 lines of bajra (pearl millet) 10,600 lines of Bengal gram (chick pea) and 5,530 lines of arhar and tur (pigeon pea)

It has recently started work on groundnut and is assembling the world germplasm on this important crop, on which adequate research work has not been done so far

The ICRISAT scientists try to evaluate the lines and study their behaviour towards diseases and pests and catalogue their characteristics before making the lines available to any breeder in the world for a specific crop improvement programme

ICRISAT, operating since 1972 under the Consultative Group on International Agricultural Research, aims at helping the poor farmers of the semi-arid tropics whom modern technology has only touched lightly. One of the main constraints of this farmer is limited-water distributed during a short rainy season. About 500 million people live in the semi-arid regions spread over 48 countries

The researches taken up in the institute focus mainly on improving the principal food crops in the region as well as the farming systems to help increase and stabilise agricultural production

Mansurwari Dam Nearing Completion

Work on the Rs 14 9 million Mansurwari Dam Project near Deori i Sagar district of Madhya Pradesh is going apace On completion, the project will provide irrigation to 2,800 hectares of fertile farmland in 21 villages It is expected to be completed this year

The project, work on which was started in June 1975, envisages the construction of a 3,100 ft. long and 72 ft. high masonary dam across Shukhchain rivulet with a storage capacity of 5,127 lakh cft of water Total length of canal system of the dam will be 14 miles with a 315 ft long waste wier.

Arunachal Pradesh Annual Plan 1977-78

The outlay for the Annual Plan of Arunachal Pradesh for 1977-78 will be of the order of Rs. 13 63 crores This will be Rs 3 93 crores (40 2 per cent) more than the current year's Plan outlay, which is Rs 9 70 crores

The Fifth Plan outlay for Arunachal Pradesh is of the order of Rs 63 29 crores inclusive of Rs. 8.55 crores for core projects specially approved by the Planning Commission. The actual expenditure during 1974-75 was Rs 6 64 crores During 1975-76 it was Rs 7.76 crores. The 1977-78 Plan outlay is Rs. 30 85 crores

The break-up of the outlay under major heads includes: Agriculture and Allied Services Rs 3.90 crore, Cooperation Rs. 45 lakh, Water and Power Development Rs. 1 10 crore, Industry and Minerals Rs 26 lakh.

HIMACHAL'S

Achievements

Under

24-Point Programme

- One-acre land given to all landless tillers
- More land given to small farmers to raise their holdings to one acre.
- House-sites given to all houseless persons.
- Proprietory rights given to occupancy or non-occupancy tenants
- Private debts of poor villagers (annual income upto Rs. 2400) written off
- Easy and cheap finance for economically weaker sections. Rs. 90 lacs given so far
- Consumption loans through cooperatives.
- Cut in administrative expenditure.
- Anti Dowry Bill passed
- Three crore trees being planted.
- Cheaper food and more sugar for hostel students
- Cheaper text books and exercise books for al students
- Controlled Cloth for all
- Lower prices of essential commodities
- Higher Minimum wages for workers
- More employment for Youth
- Better Tax collection
- More electrified villages and enhanced pow generation
- Better deal for handloom workers.
- Stringent prohibition policy adopted.
- One lac sterlizations being performed.

HIM LOK SAMPARK

HARYANA : An Action-Packed Decad

Certainly, a decade is a small dot in the lithograph of Time. It is too short a span even for a small

NOT SO IN HARYANA

Here time and effort have telescoped the decades of progress.

In this decade, something has happened. What is it?

Here, in this Fastest Growing State of India, per-capita income is the second highest A peep into sa features is surely worth it

EARTH YIELDING MORE

From scanty, we have marched ahead to plenty. Ten years before, the Agricultural production merely 25.92 lakh tonnes, i e there was not enough for everybody in Haryana itself But now the figure doubled and gone upto 50 49 lakh tonnes—contribution towards the Central Pool being some 14 lakh tonr

WATER FOR PARCHED LANDS

Irrigational facilities have been provided to additional 4.06 lakh hectares by means of :—

(i) Lifting waters upto 570 ft;
(ii) Avoiding seepage losses of 638 cusecs,
(iii) Utilising 1426 cusecs of flood-waters; and
(iv) Exploiting 1575 cusecs from ground-water resources

The total irrigated areas has risen from 13 lakh hectares to 17 lakh hectares It is likely to increas 23 lakh hectares as soon as 3 5 MAF water of Haryana's share in the surplus Ravi-Beas waters becomes a' able

AN ELECTRIFIED SCENE

By November, 1970 it had earned the distinction of being the first State in the country to have achi 100% rural electrification target. Per capita consumption of electricity has gone up from 57 to 139 u and the number of consumers from 3,49,575 to 7,93,139 Agricultural sector alone consumes 45% of the t connected load—the percentage being the highest in the country

HOME-STEADS FOR WEAKER SECTIONS

Over 2 15 lakh dwelling sites have been given to the Harijans and another 3 lakh sites to the landless

KEEP THEM STURDY

Medical attention is being taken to all those who need it Per capita expenditure on health and m cal facilities has risen from Rs 4 60 to Rs 10 79 On medicine alone, it has gone up to 99 paise and rate is the highest in the country

FAMILIES CUT TO SIZE

Against the national level of 18% Haryana has achieved 37 2% sterilization target and earned dist tion Targets have been so revised as to achieve the zero per cent rate of population growth at the earli

MOON IS NOT FAR

The Haryana Roadways buses operate on 4 63 lakh kms daily, i e equal to the distance from earth to the moon, and carry 5 64 lakh passengers everyday

THE WHEEL SPINS

The Industrial scene in the State has undergone a radical change At present, there are about 300 l more than 500 medium and some 18,000 small scale units working in Haryana Exports of industrial go have also increased from Rs 4 50 crores to about Rs 34 crores

ILLUMINATING AREA OF IGNORANCE

Universities at Kurukshetra and Rohtak are engaged in educating and grooming of the young mind unique kind of school has taken shape in the Moti Lal Nehru Sports School at Rai, besides the prestig Agricultural University at Hissar About 18 lakh students are covered by the State's educational enterp at all levels

OUR BRETHREN TO THE FORE

Expenses on welfare of the Scheduled Castes/Backward Classes and old Age Pension Schemes have i from Rs. 27.96 lakh to Rs. 154 14 lakh.

THE GUEST WHO CAME FOR DINNER BUT STAYED!

Haryana is a pleasant place to visit The superb Holiday resorts like the Dabchick, Golden Oriole, Whi ing Teal, Purple Sunbird, Mayur, Magpie and Rosy Pelican are now on the country's Tourist Map. Eve short visit will suffice to convince you

20-POINT ECONOMIC PROGRAMME
IN
ARUNACHAL PRADESH

The Prime Minister's 20-point economic programme has ushered in a new era of socio-economic fulfilment in Arunachal Pradesh. ARUNACHAL PRADESH an area that suffers century-old neglect and misery is now passing through a most significant phase of her socio-cultural life. An area that merits rapid development and urgency of socio-economic schemes, the 20-point economic programme has proved to be an economic charter containing remedial measures for quick development and has given a new dimension to socio-economic planning in the area. The Government's concrete measures are as follows:

(a) Procurement and distribution of essential commoditeis by a vast net work of consumer cooperative stores with a view to stabilise prices and also the responsibilities of procurement and processing of agricultural produce like paddy, mustard seeds etc. in the surplus pockets entrusted with the cooperatives.

(b) Free supply of text books to all bonafide tribal students from Class I to Class VI and on highly subsidised rates to students from Class VII upwards.

(c) Arrangement also being made for starting of book banks for the benefit of children belonging to weaker sections.

(d) Facilities for training to the teachers are also made available.

(e) Encouragement and initiatives being given to farmers to take to permanent cultivation with specific methods. Fertilizers and HYN seeds of different crops are supplied on subsidy basis.

(f) With a vast potential for vital power, Arunachal Pradesh looks forward to an ambitious programme of rural electrification in the interior which will not only be sufficient for domestic consumption but also for the growth of small and medium scale industries in the near future. Guided and inspired by the dynamic objectives of the 20-point economic programme, teams of technical experts from the Central Electrical Authority have visited Arunachal Pradesh to explore the possibility of electri fication by tapping unlimited hydraulic resources of the territory.

(g) In keeping with the rich tradition in weaving, carpet making, wood carving and painting, the Arunachal Pradesh Government has pursued a consistent policy aiming at the revival and enrichment of the traditional arts and crafts with active encouragement and popularisation of styles and designs. The aim, so far as practicable, is to sponsor self-employment ventures by providing financial aid and technical guidance to the trainee. Local artisans and 20 units of such entrepreneurs are actively pursuing the particular trade as a source of livelihood.

AND

Many more socio-economic schemes within the broad spectrum of 20-point economic programme, Arunachal Pradesh is heading towards a more prosperous and better future.

years of service to the public sector

Dasturco pioneers engineering self-reliance

Established at the instance of Government, Dasturco has, since its inception, been closely associated with the development of the public sector—in the planning, design and engineering of steel and other projects for the Central as well as State Governments. As pioneers of steel plant engineering in India, it is in the forefront of new technologies ■pelletizing and sponge iron ■OBM and electric arc steelmaking ■continuous casting ■vacuum degassing ■Sendzimir mills etc.

Mining and ore beneficiation
Dasturco is the only organisation in India with the special expertise on magnetite ores and its pelletisation. The firm has carried out intensive investigations in India and abroad on the Kanjamalai magnetite ore, similar to the Kudremukh ores.

Integrated Steel Plants
Dasturco is providing engineering services in specified plant areas for Bokaro. It is also consultant to Government on the Visakhapatnam Project—the first coast-based steel plant in India.

Alloy and Special Steels
The full range of services—design, engineering, working drawings and construction supervision—were provided by Dasturco on the Alloy Steel Plant, Durgapur—the first large metallurgical unit to be completely designed/built by Indian Engineers. Dasturco is also consultant for the Alloy and special Steels Plant at Salem, the Phase I work on which is now in hand.

Uranium Mill and Nuclear Fuels Complex
As consultants to the Department of Atomic Energy, Dasturco provided engineering services on the Uranium Milling Plant, Jadugoda and the Nuclear Fuels Complex, Hyderabad, which provide the fuel elements to India's nuclear reactors.

▲ *Raw materials handling system, Bokaro Steel Plant*

▲ *Magnetite ore mining and beneficiation, Kanjamalai, Tamil N*

▲ *50-ton arc furnace tapping, Alloy Steel Plant, Durgapur*

▲ *Leaching pachukas, Uranium Milling Plant, Jadugoda*

Mini Steel Plants
Dasturco is consultant to various State Governments and industrial development corporations. Currently, it is providing complete engineering services on the small integrated steel plant at Chandrapur near Nagpur for SICOM, Government of Maharashtra.

MDC-398

The people at ONGC fulfil another pledge—by producing 32,000 barrels of crude per day at Bombay High—in just three years from the first oil strike. Within this short span of time, ONGC has also mastered a whole new technology.

By the end of 1977, ONGC hopes to double production of crude from Bombay High to nearly 80,000 barrels per day.

On shore, too, ONGC has intensified its activities. There is a country-wide search for new oil fields. Simultaneously, all-out efforts are being made to strengthen indigenous capability—by developing expertise, personnel and equipment.

The strength to achieve this lies in the 23,000 dedicated men who constitute ONGC. And in the fact that, by its own constitution, ONGC is committed to carry on a ceaseless search for oil.

And, lending strength to its manpower is the manner in which the Commission's operations are constituted.

All activity is grouped under four different regions—Western, Eastern, Central and Off shore.

Happenings in every site, in every region are communicated to the Headquarters at Dehra Dun. Which, in turn, steers these operations to desired objectives, through judicious amendments, as and when necessary.

All these constituent strengths have enabled ONGC not only to set ambitious targets, but also to achieve them On shore as well as off shore.

And ONGC's success at Bombay High is just the preamble.

Oil & Natural Gas Commission
Tel Bhavan, Dehra Dun.

Our strength is in our people

Oil flows
-the nation grows

Workers help produce more, reduce waste

About a year ago was launched the scheme for Workers' participation in industry (item 15 of the 20-point programme).

Already, 356 units in the Central Government have implemented the scheme, resulting in improved production & efficiency. Wastage has been reduced. Production targets have been exceeded, in unit after unit.

In the states, 1079 units have adopted the scheme. Some of these employ even less than 500 workers. But the benefits spread; the Nation moves.

INDIA MOURNS THE DEATH OF A GREAT SON

WHEN THE President Shri Fakhruddin Ali Ahmed cancelled his visits to Burma and the Phillipines on medical advice and returned to New Delhi on February 10th, he looked relaxed and little could we imagine that his life-time was soon destined to come to an end.

Son of Col Z A Ahmed and Smt. Roquya Sultana, Fakhruddin Ali Ahmed was born on 13th May, 1905 in Delhi His parents originally belonged to Kacharighat in Assam After his early education in the Government high school, Gonda (U P.), Shri Ahmed went to graduate from St Stephen's College, Delhi Later he went to St. Catherine's College, Cambridge, and became a barrister He was called to the bar from the Inner Temple, London in 1928.

In 1931 he became a primary member of the Indian National Congress. He was imprisoned for one year for offering individual Satyagraha in 1940 and immediately after release he was detained as security prisoner for 3½ years till April 1945.

He was elected to the Assam Legislative Assembly in 1937 from Kamrup. He became the Finance and Revenue Minister in the cabinet of Shri Gopinath Bardoloi in 1938-39.

In 1946 he became the Advocate General to Assam. He held this position till 1952.

Shri Ahmed joined the Assam Cabinet as Minister in charge of Finance, Law, Community Development, Panchayat and Local Self Government following his election to the Assam Assembly in 1957.

He joined the Cabinet of Smt Indira Gandhi in 1966 and held various Portfolios at the Centre. He resigned in 1974 following his nomination by the Congress Party to the Presidency.

A lover of sports and a keen sportsman himself, Shri Ahmed evinced keen interest in literature and the arts.

He was the President of India during a critical and momentous period and in his death the nation has lost not only a great leader, but also a sincere, dynamic and devoted servant of the people.

Tamil Nadu

A Year of Peaceful Progress

K.R. Nair

It is now one year since Tamil Nadu came under President's Rule. President's Rule has been extended by another six months. Unlike some other States where inter-party or intra-party differences had brought down Ministers in the past, and the President had to take over the administration, in Tamil Nadu the debacle was caused by the rulling party, DMK, forfeiting the confidence of the people who had elected it to power.

THE YEAR THAT has passed has witnessed miraculous changes in the administrative set up. The first task that faced the Advisers when they took over was the need to tone up the administration, many of whose personnel, particularly at certain top levels, had become mere automatons blindly carrying out the orders, often illegal and contrary to rules, of the Ministers. While some of them were willing tools, others not so willing but allowed themselves to be compromised because of fear of consequences which might have resulted from non-compliance A qualitative change in the attitudes of officials manning the various levels of administration has now been brought about This involved considerable reshuffling of personnel and their change around. Quite a few cases where abuse of power was detected were inquired into and disciplinary action taken 528 Gazetted officers and 256 N.G O's had been compulsorily retired till the end of October 1976; fourteen of the gazetted officers have been reinstated

Government-appointed commissioners for disciplinary proceedings are functioning at Madras, Madurai and Coimbatore Corruption charges against gazetted as well as non-gazetted officers are being looked into by them

Governor of Tamil Nadu Shri Sukhadia distributing pattas to landless peasants.

Book banks opened in hundreds of schools and colleges to help poor students.

Conditions at the 'cutting edge' level have also come in for consideration and rectification by the Government. Cumbersome proceedings have been simplified and public grievances and complaints receive instant attention unlike in the past when those making representations often received cavalier treatment from administrative personnel charged with the task of rendering redress. Priority attention was devoted to units like police stations, Departments of civil supplies, transport and rationing, block offices, hospitals, banks, treasuries etc. There has, consequently, been considerable improvement in the efficiency and behaviour of the per-
Shri Nair is former Chief Reporter, P.T.I., Madras.
sonnel concerned. Efforts are on to maintain the tempo of change.

Punctuality has become the watchword for staff in Government offices where files now move faster and the attitude of 'laissez faire', noticed earlier has disappeared.

The past year has seen a remarkable change for the better in the field of police-public relations and the acerbity which had almost become a characteristic of the relations is slowly disappearing. The image of the police in the State had suffered a great deal of damage owing to its incapacity to tackle acts of goondaism indulged in by ruling partymen. There were instances of police excesses, callousness and indifference to public woes Steps

To promote higher agricultural production, more irrigation facilities are being provided especially in the drought prone areas.

Provision of drinking water in villages has been given top priority.

taken by the Administration to remedy this depressing state of affairs included mass transfers of officers and men belonging to the force whose integrity was in doubt. Complaints are now registered promptly and inquired into Senior officers undertake tours of interior villages in order to infuse a sense of security among the weaker sections and to inquire into complaints of harrassment by lower ranks of the force. Police-public relations are now governed by a 22 point character which conveys to the police their obligations and to the public their rights.

Though policemen have not turned into knights in armour, they are fast becoming true guardians of public lives and property-a desideratum devoutly wished for, but seldom attained.

The discipline noticed in all walks of life in the wake of the proclamation of emergency is happily enough continuing Peaceful conditions prevail in the State and protest meetings, processions and 'morchas' which used to occur at the drop of a hat are absent Students, freed from the pressures which used to be exerted on them by extraneous elements, have gone back to their studies, and college campuses now present a picture of peace and tranquillity. In industry, labour-management relations are marked by cordiality with the machinery of negotiation being given an opportunity to settle disputes without rancour on either side. It is not as if disputes do not arise, but the moment they do, the State apex tripartite body set up by government steps in pronto and sets matters right The picture is now a completes reveral of what used to happen a year ago.

The peaceful conditions prevailing on the industrial front has enabled industries in the State to perform better and to improve production. It has also led to a revival of interest in setting up new industries in

Apprenticeship training given to educated young people to prepare them for vocation

Consumer necessities at fair prices at Fair Price Depots.

the State, and according to a department spokesman, a significant number of applications for letters of intent and licences have come in and are being processed The needs of new industries, particularly in the fields of inputs, financial assistance and infra-structure are being looked into.

Industries like leather, sugar, electronics, salt, minerals, fertilisers, handlooms, silk, tea and cement are making good progress Their problems are dealt with by government on an individual basis instead of collectively under the head 'industry' as in the past A special committee set up by Government during the year is currently engaged in identifying the areas in which production in the electronics industry can be stepped up. The necessary developmental facilities are being set up at selected centres. It has been decided to set up an Electronics Corporation to assist the industry.

Workers have been given increasing voice in the affairs of management of factories and industrial establishments

Tamil Nadu which has attained considerable fame as an exporter of leather, is now switching over to the manufacture of finished leather and leather goods. Units are being set up in various centres in the State in collaboration with countries like Italy, Yugoslavia and France. The setting up of a leather Corporation is also on the anvil.

The economic condition of a number of textile mills in the State is less than satisfactory, but timely steps taken by the administration have helped in stemming the rot Since most of the mills are devoted to spinning, certain problems arise now and then in the realm of prices of cotton and sale of yarn, for both of which they have to depend on outside markets The causes for the sickness of the mills are investigated and solutions suggested, "but the problems are such that only the Central Government can find solutions "Meanwhile things are very much in hand" he added.

Cement factories in the State have been taking full advantage of the current boom on the export front. West Asian countries, where considerable building activity is going on, have been among buyers of cement from Tamil Nadu

Small scale industries have also been enjoying a good period and more industries are being licensed in the State Against a target of 5,900 small industries proposed to be set up by November 19 last on the occasion of the Prime Minister's 59th birthday, as many as 10,000 were registered and most of them are expected to become productive in three to six months time.

A development which has given considerable gratification to the new regime is the eagerness evinced by a number of entrepreneurs from out-

Institution of private money lenders has been abolished and institutional credit has been sanctioned to thousands of needy peasants.

Conferring ownership rights on landless labourers who have been in occupation of the sites belonging to landlords.
side to set up industries in the State. According to a spokeman of the industries department this was an indication of their confidence that conditions in the State were now ideal for investment. Efforts are being made by the agencies concerned to extend all facilities and the necessary infra-structure to the entrepreneurs.

Peace on the industrial front has also helped some of the Centrally-owned industries to show better results. The Hindustan Photo Films at Ootacamund has turned the corner and the Neyveli Lignite Corporation, which has been in the red since its inception, is expected to show a profit of Rs. 4 crores in the current year

Managements of cooperatives in the State have come in for considerable shake up during the year Management of practically all of them have been put under special officers and those among the former executives found guilty of malpractices are being arraigned before the courts. Under the DMK regime, most of the managements of the co-operatives were headed by ruling party nominees and they had been playing ducks and drakes with the societies' funds, diverting large sums to enrich their own private coffers. Co-operatives now play a very important role in meeting consumption credit needs of their member for meeting expenses arising from marriages, sickness and deaths. Allocation for jewel loans has been increased to Rs 40 crore during the year, which is double that made in the previous year. As a result of a drive launched during the year, as many as 33 lakh out of the 50 lakh agricultural families in the State have become members of co-operatives in the State, which represents an increase of about 5 lakh from the number at the beginning of the year Seven large size multipurpose co-operatives are being set up to assist tribal people in the State. These will not only extend agricultural and consumption credits to the tribals, but also assist in processing their produce and marketing them.

Administrations of some important temples in the State which had become hot beds for corruption were superseded during the year and

Deprived and backward villagers are receiving special attention.

Bonded labour has been abolished and the freed labourers are now treated on par with other paid labourers.

Supply of much needed agricultural implements and bullocks to the poorest peasants has been made in many villages.

Controlled cloth being distributed to the poor in fair-price shops.

placed under special officers. Some members of previous boards of Trustees are now facing charges including alienation of lands and property belonging to the temples, favouritism in the matter of appointments of trustees and diversion of temple incomes for personal and party purposes.

An important development during the year was the creation of the Southern rice zone. The free flow of rice from Andhra Pradesh and Karnataka into Tamil Nadu will have a steadying influence on the prices in the State. Foodgrain position in the State, according to an official spokesman, is satisfactory, though a short fall of about ten lakh tonnes in production against the targetted 84 lakh tonnes is expected this year as a result of the failure of the south west monsoon and lower availability of irrigation water from Mettur and consequent shrinkage in the acreage raising paddy. In any normal year, paddy is sown over an area of 70 lakh acres, but this year paddy could be raised only in 42 lakh acres. There is no anxiety on the food front as the stock position is comfortable The government of India has given a generous assurance of aid should the need arise

Twenty Point Programme Implementation

As far as the 20-point economic programme is concerned, good progress had been made in implementing it, despite the delayed start it got. The following is a brief summary of the progress under the items which come within the State's Juridiction:

The prices of rice and other commodities have been kept within reasonable levels. The price of boiled rice (medium), the staple food, ranged from Rs 1.90 per Kg at Madras and Rs 2 20 per Kg at Tiruchirapalli in December, as against a wide variation ranging from Rs 1.60 to Rs 3 10 per Kg a year ago. The price of *cholam* (maize) remained steady around Rs 1.60 and that of ragi ruled around Rs 1.40. The prices of Blackgram and Bengalgram remained more or less steady at about Rs 3.50 to Rs 3.80 per Kg. and Rs 1.80 to Rs 1.90 per Kg respectively. The price of groundnut oil ruled between Rs. 6.50 to Rs 7.50 per Kg.

The price of chillies, the chief spice of mass consumption, ruled around Rs 7.00 per kg, a decline of more than 50 per cent compared with the prices that prevailed a year ago.

Procurement of foodgrains during the kharif year has reached an all time high of 8.2 lakh tonnes.

The Civil Supplies Department is operating ten departmental stores where all essential commodities are available at reasonable prices. This part of a drive to hold the price line.

Between February and November 1976, 12,412 acres have been assigned to 9,461 persons, of whom scheduled caste beneficiaries were 4,924. During the period from February to November, house sites numbering 1,56,526 have been assigned by way of unobjectionable encroachments. The beneficiaries included 35,795 belonging to scheduled castes and 2,009 to scheduled tribes Against the target of 59,000 house site pattas to be distributed on 19th November, 59th birthday of the Prime Minister, 1,22,306 were actually given away on that date.

Bonded labour freed in the State total 2,652. Cultivable lands have been assigned to 525 families and adhoc employment and subsidiary farming assistance has been given to 626 families. Under the Tamil Nadu Debt Relief Act, passed on July 29, 1976 so far 2,70,532 instances of debt have been written off, the amount involved being Rs 3,85,869 benefiting 998 persons

With effect from 2nd March 1976, the minimum wages for agricultural labour have been enhanced and range from Rs 3 50 to Rs 9 00 per day for adults and from Rs 2.10 to Rs 5 00 per day for non-adults. By a notification issued in November under the Minimum Wages Act, employers who had been paying wages higher than minimum wages, have been asked to continue to pay at the higher rates Government has posted officers in predominantly agricultural areas to ensure endorcement of the provisions of the Act.

A target of 18,000 hectares to be brought under new irrigation has been fixed for Tamil Nadu Sixteen major and minor irrigation projects are currently under execution in the State and Rs. 86 95 million had been spent till the end of November 1976 out of the budget estimate of Rs 1,613 lakhs

Under the programme for sinking bore wells. against a target of 6,700 bore wells to be sunk in the drought affected districts, 6,689 were actually completed by the end of November

Work on the execution of the Tuticorin thermal power project is in full swing. The current year's provision is Rs 34 50 crores. 19,960 agricultural pumpsets have so far been energised against the targetted 35,000 pumpsets for 1976-77.

Sustained efforts are under way to revitalise the existing handloom cooperative societies in the State and to form new ones. There were 848 weavers cooperatives in the State at the end of November 1976. To enable formation of new societies as well as for admission of weavers in the existing societies, loans to individual weavers aggreating Rs. 23 94 lakhs were sanctioned by commercial banks up to the end of November. 24,961 bales of cotton yarn valued at Rs. 79 86 million were supplied to the primary weavers societies during the period from February to November 1976. The export-oriented handloom project

Adequate funds have been provided to augment power production, so necessary for growth in industry and agriculture.

National permits have been given to trucks to improve movement of essential goods between States.

Students from poor families pursuing higher studies are provided essential commodities at hostels.

at Karur and the intensive development projects at Erode and the silk weaving centre at Kancheepuram have gone into production.

Production of controlled cloth (sarees and dhoties) on handlooms has been taken up on an experimental basis; 5,000 handloom 'janata' dhoties and 2,000 'janata' sarees were released in October. Regular sales of controlled cloth are being done by COOPTEX, the apex Society, from December. The distribution of controlled cloth through cooperatives has been streamlined so as to ensure that 75 per cent of the allotment reaches the rural areas. There are 4,682 retail points, of which 4,000 are situated in rural areas.

Workers participation in industry· out of 228 units in the State which the scheme applies, 206 have implemented it so far.

Permits have been issued to 222 persons so far in the State Under the National Permit Scheme for road transport.

Out of 1,204 hostels, 1,141 are being supplied with essential commodities at controlled rates, benefiting 1,08,068 students.

Out of 212 colleges, book banks have been opened in 201 and the total number of books collected is 2,05,361. The value of the books supplied till the end of November was Rs. 26.71 lakhs. Work of distributing books to schools has been entrusted to cooperatives in the State. They had sold books worth Rs. 25.5 million till the end of November.

9,242 training places had been filled up by the end of November, 210 of them women apprentices and 4,047 belonged to scheduled classes and minorities.

The Tamil Nadu Youth Congress has been spearheading the campaign for popularising the 5 point programme of Mr. Sanjay Gandhi. Youth Congress workers who had been working among the student community as well as among the youth in the State have registered some success in the campaign do away with the dowry system and pledges to fight the evil are pouring into the office of the youth congress from all over the State.

Family planning which has pride of place in the programme has been receiving a great deal of attention at the hands of Government A state family planning review committee consisting of officials and non-officials with the Governor as Chairman, has been set up to ensure that the programme is well carried out. Against six lakh sterlisations targetted for 1976-77, 3.16 lakh operations had been completed by the end of October. Tamil Nadu which has been one of the leading States in the country in the field of family planning is the first State in India to bring down the birth rate to 29 per thousand, presently the lowest in the country.

The foregoing account gives a picture of the various targets fixed and achieved under President's rule. The period has been one of all around improvement. The rule of law, which had to give before the onslaught of acts of lawlessness and goondaism under what practically amounted to official auspices a year ago, has been restored, fissiparous and secessionist trends, which had raised their ugly heads, have been fought to a standstill and conditions for orderly progress of the State created These are solid gains of which any administration can be proud of. □

An Integrated Approach To Rural Development

A Re-Thinking Is Called For

Integrated rural development has become a national slogan and science and technology, the main instrument proposed for its implementation. What exactly do we mean by this? Development in Indian conditions is an inter-disciplinary concept and it is not the exclusive concern of the professional economist What we need is a conceptual analysis of the village as unit of development and not every one of India's villages can be considered a viable unit In this thought—provoking lecture DR. V K R V RAO poses the problem from the administrative angle and it is no small problem as he sees it

YOJANA will be happy to carry informed discussion on Dr. Rao's thesis

THERE HAS been a great deal of talk in recent months about the need for bringing about integrated rural development in our country The Government of India have announced their approval for starting pilot projects for integrated rural development in twenty districts, one in each state The Indian Council of Agricultural Research has already initiated programmes of integrated rural development in several areas dispersed all over the country The Council of Scientific and Industrial Research has been operating a programme for integrated rural development in the Karimnagar district in Andhra Pradesh and has announced its intention to start similar programmes in several other districts in the country. In all these proposals and programmes, the accent is on the use of science and technology for the solution of the problems of rural development. Several universities and institutions of higher education have taken up progiammes of rural development in selected areas; and in their case also, the accent appears to be on the use of science and technology for rural development, though this is not clearly stated in all cases Thus integrated rural development has become a national slogan and science and technology the main instrument proposed for its implementation

---

Excerpts from XVI Convocation Address to the Indian Agricultural Research Institute.

WHAT DO WE MEAN BY INTEGRATED DEVELOPMENT?

When we talk of integrated development, we are not talking just in economic terms In fact, all aspects of life and activity, which are subject to manipulation and controlled change, come within the sphere of development The goal of development thus becomes the enrichment of the quality of life and its availability at minimum levels to all sections of the population. Development is not merely the provision of opportunities for resource development in the light of appropriate science and technology but also their actual utilisation and, therefore, the creation of the necessary facilities for such utilisation Thus the power structure, its class composition and its unequal incidence the interests it serves, institutions economic, social and political— state of the law, the state of kno ledge and use of science and te nology, information and commu cation, bureaucracy, monitor and evaluating the progress of de lopment—all these fall within scope of development Developm thus becomes an inter-disciplina concept, which is no longer exclusive concern of the prof sional economist or scientist technologist.

Integrated rural development volves the development of both tural and human resources and t has to be done within defined are It also requires the identification the poor and specific measures des ned to lift them above the level poverty. Integrated rural develo ment does not only mean agric tural development or increase agricultural productivity. It has include all productive activity su as secondary and tertiary, and p mary other than crop-raising. N only has it to include all prod tion and means designed to impro productivity, but also to provide

full employenmt, and an equitable distribution of the proceeds of development with particular reference to the elimination of poverty. It should be clear therefore that while science and technology can certainly help, they cannot do it by themselves nor function as a magic wand.

VILLAGE AS UNIT OF DEVELOPMENT

To begin with, it is necessary to recognise that development, whether of natural or human resources, is area-bound and has to have viability and effectiveness of integration in area terms. The area that is talked about today for development is the village We want the village as the unit for rural development and take it for granted that it is both an effective and a viable unit for the purpose. But the village is not a homogeneous concept. In fact, we have never undertaken a conceptual analysis of the village but treat it as a description that includes within its range all human settlements that the census classifies as a village. But, is the census village a viable unit? Does it contain the area and population base necessary for integrated development? Can we bring about either full employment or distributive justice and elimination of poverty or provision of a minimum of developmental and welfare services or popular participation or even maximisation of output or productive application of science and technology by treating the village identified by the census as the unit for development? I have no doubt in my mind that the answer to these questions is in the negative, and that we will not get the full dividends from developmental programmes nor achieve the admitted goal of rural development without a significant enlargement, by regrouping or otherwise, of the majority of the areas which the census now classes as villages

I shall now illustrate my thesis by referring to the facts of the case. According to the census of 1971, India had a rural population of 438.9 million who were living in 5,67,338, inhabited villages. But the distribution of this rural population by number and population size is of a skewed character that is parallel with the skew phenomenon that characterises the urban population, the distribution of income and wealth, and sharing of the good things in life, and in fact, the entire social and economic structure of the Indian policy. I give below the percentage distribution of India's rural population by number and population size of India's villages in 1971:

Village population size		Number	Population
Less than 500		55 34	16.37
Between 500 and 999		23.08	21.50
Between 1,000 and 1,999		14 23	25.77
Between 2,000 and 4,999		6.25	23.82
Between 5,000 and 9,999		0.86	7.45
Above 10,000		0.24	5. 9
	Total	100.00	100.00

Of India's 5,67,338 villages, as many as 3,52,023 had a population of less than 500 each, while of this number, more than 50 per cent had a population of less than 200 each. How is it possible to have either developmental or welfare services, which would have quality and effectiveness, for settlements containing 40 or 100 families? What kind of economic viability can such small population units have in terms of either production or distribution or employment or needed changes in their Power and social structure, And in the absence of economic viability, what can be the effectiveness of the vast amounts we are spending on their development as individual units? These are basic questions which have received inadequate, if not nil attention, in all the discussions we are having on rural development or in the programmes that are formulated for such development. It is high time that we started paying attention to this basic problem of the minimum rural settlement that should form the basis for the planning and implementation of all programmes of integrated rural development The problem is not only to determine the size of such a minimum unit but also to devise ways and means for bringing such minimum units into existence by grouping clusters of villages with necessary social, economic and resource links into new viable villages and establishing the necessary transport facilities between the villages composing any given cluster so that each cluster of villages constituting a new village can function as one integrated unit

The seriousness of the problem of uneconomic and unaviable village size becomes even more evident when we desegregate the national totals and look at the position in the major states of the Indian Union. Leaving out Kerala which stands in a class by itself, and to which shall revert later, the proportion of the number of villages with population between 500 each to the total number of all villages in each state varies from 18.9 per cent in Tamil Nadu to 66.4 per cent in Madhya Pradesh and 73.1 per cent in Himachal Pradesh, while the proportion of the rural population residing in villages with less than 500 persons to the total rural population in each state varies from 2.8 per cent in Tami Nadu to 38 percent in Madhya Pradesh and 66.8 per cent in Himachal Pradesh.

The problem of uneconomic or non-viable villages is much sharper in the northern, central and eastern regions of the country with the exception of Haryana, followed by the western region, Maharashtra having a worse position than Gujarat. The situation is much better in the southern states with the exception of Karnataka, while Kerala stands in a class by itself.

According to the census, Kerala has a rural population of 84.8 per cent But the composition of his rural population classified by village population size is totally different from that of the rest of India, with nearly 87 per cent residing in villages with a population of more than 5,000 each and less than one per cent residing in villages with a population of less than 2,000 each, classed as rural because of the dominance of agricultural and allied activities in the occupational distribution of the population It is obvious that rural settlements in Kerala are quite viable from the point of view of developmental and welfare services, as the bulk of their rural population live in villages having a population of 5,000 and more persons. This fact is undoubtedly a major explanation of the vast progress that Kerala has made in the provision of educational and health services to its rural population, as compared to other states, its relatively greater success in family planning and reduction of the birth-rate and death-rate in rural areas, and the greater capacity for cohesion and collective

organisation it has been able to achieve among its rural population.

While it may not be possible for the other states in the Indian union to emulate the example of Kerala and have their rural population residing in settlements with 5,000 people and above. Kerala's striking position in its village composition and its developmental experience clearly indicate the need for enlarging the size of the operational village in the rest of India My own view is that a population of 5,000 would be an ideal size for a viable village unit, but this seems to be beyond the bounds of practicability in the foreseeable future I suggest therefore two alternative models for village restructuring and re-composition in order to make the Indian village a viable unit for integrated rural development. One is to aim at a village with not less than a population of 1,000 persons and the other with a population of not less than 2,000 persons. The first model would involve a re-structuring of 4,51,623 villages with a population of 166 3 million in order to convert them into 1,66,286 villages or 36 8 per cent of their existing number The second model would involve a re-structuring of 5,33,596 villages with a population of 279.4 million in order to convert them into 1,39,724 villages or 26 2 per cent of their existing number As the second model will also present immense difficulties in implementation, I would suggest the first model for adoption

The task appears to be gigantic but not as formidable as it appears at first sight Except in states like Himachal Pradesh and Tamil Nadu and Kashmir and parts of states like Madhya Pradesh, Bihar and Orissa with their triba belts, U.P. with its hilly areas and Rajasthan with its desert background, most Indian villages are in close proximity to one another, separated by a distance of 2 to 7 or 8 kilometres; and it should not be difficult to reconstitute them into single villages with rural roads designed to link thee clusters of villages into one village rather than merely attempt to link all villages to the towns as is the case with the present rural roads programme. An exercise undertaken recently by me in connection with my project for integrated human resource development of a backward district in Karnataka state has given me the feeling that it is possible to find such clusters for being formed into single villages, and this has given me some confidence for putting forward a proposal for the re-structuring of villages to form them into viable villages or rural settlements that can form a more economically efficient base for integrated rural development than the existing villages with their very small populations

Reconstitution of villages is a state subject But the state governments already have the power to undertake such a reconstitution Thus, for example, the Karnataka Land Revenue Act of 1964 empowers the state government to, I quote; "Subject to such conditions and in such manner as may be prescribed, alter or add to the limits of any village or amalgamate two or more villages or constitute a new village for the purpose of this Act" Then again the Karnataka Village Panchayats and Local Boards Act of 1959 includes a similar provision for village reconstitution, I quote: "Whenever the government, after making such inquiry as may be prescribed, is satisfied that any area comprising a revenue village or a group of revenue villages has a population of not less than one thousand and five hundred but not more than ten thousand, it shall by notification in the official gazette, declare such area to be a village" All that is now required is to include the concept of viability for integrated rural development as a major criterion for the re-structuring and enlargement of existing villages, bringing within its scope education, health, cooperation, panchayats, other developmental and welfare services, and use of science and technology for improvement of equipment and skills in rural production.

Other Major Factors

There are three other factors bearing on rural development to which I would like to make a brief reference The first is the emphasis that is now being laid on distribution of agricultural land to landless labour It needs no special arguing to show that the possession and cultivation of agricultural land does not by itself ensure the abolition of poverty, if the size of the holding cultivated falls below a particular minimum. A recent study of a taluk in East Godavari district has revealed that even with a 100, per cent irrigation and according intensity of 1 7 to 2, the annual income earned from

Number			Population		
Rank	State	Percentage	Rank	State	Percentage
1.	Himachal Pradesh	93 07	1	Himachal Pradesh	66 81
2.	Orissa	71 87	2.	Orissa	33 78
3	Madhya Pradesh	66 35	3	Madhya Pradesh	32.32
4.	Jammu & Kashmir	60.70	4	Jammu & Kashmir	25.02

	ALL INDIA	55.33		ALL INDIA	16.37

cultivating household to cross the poverty line. And 35.7 million operational holdings out of a total of 70.5 million or more than 50 per cent are of a size of less than one hectare of land. The average size of an operational holding in this category is only 0.41 hectare, and its irrigated component is only 0.12 hectare. Though these marginal and sub-marginal holdings cover only 9 percent of the total area of land operated in Indian agriculture, they account for more than 50 percent of India's cultivator household. Would it not be desirable to use any land available for redistribution to increase the size of the holdings of these marginal and sub-marginal farmers rather than add to their number by giving lands to the landless labourers? A number of studies have shown that the marginal and sub-marginal farmers, whose land holdings are obviously below the minimum economically viable size, have an income level not different from that of agricultural labourers in fact in some areas agricultural labourers earn a higher income than these marginal and sub-marginal farmers From the strictly economic point of view and for speeding up the process of industrialisation, is it wise deliberately to increase the number of the under-employed in the rural economy? Is not this tenuous link to land, where the holding is sub-marginal and incapable of giving an acceptable minimum living, a disincentive to the motivation to initiate projects of non-agricultural activity and thus diversify the economic structures and lead to larger production and more full time employment?

In my considered opinion, it was wrong to club together marginal and sub-marginal cultivators and landless labourers as one economic category to whom the same prescriptions are sought to be applied for the elimination of their poverty. The task of integrated rural development is hampered by not having a policy of an economically viable minimum agricultural holding, which should be extended to the maximum possible extent to the existing marginal and sub-marginal farmers and make Indian agriculture a more worthwhile occupation for the vast number of cultivators who now account for such a small proportion of the total agricultural output. I would further suggest that landless labourers should be placed in a position where their wages would give them an income that brings them above the poverty line instead of keeping their number at a level which keeps them prepetually below the poverty line. For dealing with surplus agricultural labourers, I would suggest that we devise programmes of full time employment or self-employment activity in the non-agricultural field that would speed up the process of industrialisation and give a more balanced structure to the Indian economy

Population Size	Number of villages		Population of villages	
	Number	Percent of total	Number	Percent of total rural
Below 500	6	0.38	1151	0.1
500 to 999	18	1.14	13,201	0.10
1000 to 1999	57	3.62	86,695	0.60
2000 to 4999	395	25.11	1477,542	10.30
5000 to 9999	587	37.33	4143,999	28.88
Above 10000	510	32.42	8625,456	60.11
Total	1,573	100.00	14349,574	100.00

The second factor is the basic connection that exists between development, and effective and motivated participation in the developmental process by the vast body of the rural poor belonging to the category of marginal and sub-marginal farmers Such participation by the poor among the cultivating classes is not possible unless there is a fundamental change in the existing rural power structure in regard to the utilisation of the facilities created by government for rural development, and a radical alteration in the existing structure of ownership of land and other productive assets among the rural population. Some steps in this direction are being taken under the rural provisions of the twenty-point programme and the popular movement for literacy, family planning and afforestation under the five-point programme; but we have a long way to go before we can succeed in reorienting and reconstituting the rural power structure for facilitating the process of rural growth with social justice and the elimination of rural poverty The magnitude of the task on the side of ownership of all assets, including land, equipment, and houses, has been brought out clearly by the recently published survey by the Reserve Bank on the assets of rural households. According to this survey, more than one third of the total number of rural households owned assets valued at less than Rs. 2,500 each. They included one-fifth of the total number of cultivators, nine-tenth of the agricultural labourers, more than seven-tenth of the artisans, and about two-thirds of "other" non-cultivators. The average value of assets per household in this group worked out to only Rs. 987, of which buildings alone accounted for Rs 423, and durable household assets for Rs. 137. Productive physical assets taken together averaged only Rs 392 of which again land alone accounted for Rs 242 Live-stock accounted for Rs 122 while implements and machinery accounted only for Rs. 28 and financial assets for only Rs. 20 The vast inequality in agricultural land holdings has been revealed by the Agricultural Census of 1970-71, 52 percent of the holdings being below one hectare each and accounting for only 10 7 per cent of the gross cropped area, while 0 9 or less than one per cent of the holdings were each above 20 hectares and accounted for 10 5 per cent of the total gross cropped area or almost as much area as was accounted for by 58 times their number. Unless some radical steps are taken to bring about a more equitable distribution pattern of land and other productive assets in the rural areas, it is difficult to see low it is possible to bring about either integrated rural development or the abolition of poverty in rural India

The third factor is the inability of science and technology by itself to solve the problem of rural poverty. Science and technology are, as we have seen in our experience of the green revolution, neutral to size only in theory, indivisible assets and varying degrees of access to divisible assets making for a widening of the income gap and a continuing of poverty at the lower and lowest levels of asset holdings. It is good that in recent years, Indian science and technology has turned its attention to the development of technology that would be labour intensive, based on local resources, and usable by rural personnel with limited or nil financial resources. But it would be

THE PROBLEMS OF JUTE INDUSTRY

P.C. UPADHYAYA

JUTE INDUSTRY is one of India's oldest industries with 67 mills in existence at present. The first modern power driven mill was established at Rishra near Calcutta in 1859 with the initiative of an Indian and an Englishman Today barring a few units, all mills stand clustered on both sides of the river Hooghly near Calcutta

Jute is a glossy fibre and grows on a plant which is three metre high The plant is retted in clear water to obtain the golden fibre. After the partition of our country in 1947 our jute mills faced great shortage of raw jute While all the jute mills were situated in India. out of 2.3 million acres of pre-partititoned area under jute crop, Pakistan got more than 1.8 million acres. The same product now had to be imported from Pakistan. To ease the situation, the Government took immediate steps to cultivate jute in India Table I shows the production of raw jute since partition From this table it is clear that though immediately after partition a substantial improvement in the production of jute did take place yet the position in recent years cannot be called satisfactory. In fact, a situation of stagnancy is prevailing in this crop

The importance of raw jute in jute products is obvious from the fact that it accounts for 65 to 75 per cent of the total conversion cost. Labour cost comes to 12 to 18 per cent and the balance is accounted for by overheads Thus the value added to the raw material is proportionately less and the fortune of the industry rests to a marked extent on the amount of production of the fibre and the price.

The middlemen have been operating since the beginning of the jute industry. The price difference between the price paid by the manufacturers and that received by the growers is around 25 per cent. If the cost of storage by the manufacturers till the manufacturing process begins, is also taken into account, the difference spreads to 40 per cent. Thus there is an urgent need for correction in this matter, so that the grower gets his due and the manufacturer also does not have to pay such a heavy price The jute market today is highly unorganised As much as 60 per cent of the produce is sold to the money lenders who together with other middlemen appropriate the major part of the profit

Shri Upadhyaya is Lecturer in Commerce, R R. College, Alwar.

Fair Price for Growers

In order to give fair price to the growers, the Jute Corporation of India has been made responsible for buying jute at the minimum support price of Rs 135 per quintal from the grower. However at present the Corporation does not operate fully. Its purchases are only 12 to 13 per cent of the total crop. According to the estimates made raw jute production during 1975-76 was very low, (around 5 million bales) resulting in an unexceptionable increase in its price For example throughout 1975-76, the market quotations of Assam Bottoms (a variety of jute) ruled at an average of Rs 178 per quintal against the statutory minimum price of Rs 135. A bumper crop of 7-8 million bales is expected during 1976-77. However paddy-jute price ratio is also favourable this year in West Bengal hence there will not be much diversion of jute land to paddy cultivation Weather conditions have also been favourable right from the beginning in Assam, Bihar, Orissa and West Bengal which are the major producers. In order to increase total jute production the Indian Jute Industry Research Association (IJRA) is engaged in developing high yielding varieties of jute capable of withstanding drought, flood and rot. It claims to have succeeded but is at the final stage of implementation.

TABLE I
Production of Raw Jute

Pre-partition	(millions of bales)
Output	6 5 to 7.5
1947-48	1 65
50-51	3.50
55-56	5.40
60-61	5.20
65-66	5 80
70-71	6.10
71-72	6.80
72-73	6.10
73-74	7 80
74-75	5 50
75-76	5 00
76-77	7 50 to 8 (expected)

Jute can be divided into better quality jute and lower quality jute. It has been found that in India better quality finds way into the traditional uses as gunnies and hessian and manufacturers are not able to derive full benefits.

Full economic exploitation of the jute crop is the need of the day. This can be possible only if the leaves find way towards the vegetables, the stick towards paper-making and the fibre towards some sort of wearable cloth or other non-traditional uses? Since jute is grown in an extensive area and the size of each lot depends on acreage, the problem of an organisation to handle the collections of leaves etc. has to be faced and solved.

West Bengal produces over 60 per cent of jute and 90 per cent of jute goods. This is the reason why this State has to depend on other states in the matter of food and even textiles. The extension of area under jute cultivation is to a large extent responsible for this trend. Because of the differences with Pakistan this had to be done. Jute mills could not be allowed to close down and the State had to undertake Jute cultivation despite the fact that the West

Bengal land is not as productive as the waterlogged areas of East Bengal, its cost of production is higher and the quality of jute produced is also poor.

With the emergence of Bangladesh however there may be some easing of the situation. We have a favourable balance of trade with this country and she can supply us jute, without starving her people, as a corrective measure. Bangladesh has much more jute than her industry can absorb and the situation is not likely to be reversed for a long time to come. Even the theory of comparative advantage demands that we should buy superior jute from Bangladesh so that our products may compete better in the world market Moreover the recent decline in the European jute industry has resulted in reduced exports of jute from Bangladesh to Europe Thus Bangladesh must sell jute to India

Jute Products—the Falling Demand

The figures below in Table II reveal the present crisis in the jute industry In the last few years the output of jute manufactures has declined considerably and the performance in the field of exports has been unimpressive

Jute industry thrives because of foreign demand the fall of which is the basic reason for the present crisis Recently American purchases of jute goods have found a very small part of their normal offtake because synthetic materials have proved their competitive strength inspite of the oil crisis In fact they have undertaken special R&D (Research and Development) efforts and are going to so scale their output that in their opinion jute goods would not have any chance to compete at all

Indian government gradually abolished export duty on jute goods to make them competitive but the recent 57 per cent devaluation of Bangladesh currency has put our jute goods back at their original place Such competitions should be eliminated through inter-national agreements

Recession in the American economy and the resulting reduced housing construction activities is another reason for the falling American demand. Though the economy is showing recovery, the constructional activities are still lagging behind. Houses are the chief sources of demand for jute goods.

Even in the markets of EEC and Japan, synthetic materials are proving to be quite competitive inspite of the rise in oil prices. Thanks to their R&D efforts.

Recently Russia is emerging as an important buyer of hessian but the quality and price of Bangladesh jute goods being more attractive Indian goods are likely to suffer.

Due to all these reasons the huge stocks of jute goods are accumulating with mills causing storage problems and blocking huge funds, though currently internal market is absorbing more of jute goods than before.

The Rising Cost of Jute Products

There was a short crop of raw jute in 1975-76 causing rise in prices and recently wage agreements with labour have also increased the cost of production. The best issues involve social causes and though a bumper crop is expected during this year i e 76-77, not much gain can be expected since statutory minimum price is fixed. Unfortunately unscrupulous speculators have created more problems for the industry by causing undue rise in the market price of jute goods In 1974 many foreign buyers could have switched over to jute goods from synthetics but for the rise in prices due to heavy speculative activity that year.

Something has to be done about the high freight rates charged by various shipping lines carrying jute products. In some cases the price of jute goods rises by as much as 28 per cent due to high freight As per GATT observation the freight cost should not exceed 12½ per cent of the f.o.b. value of export products. Either shippers should reduce their freight rates or government should reimburse the excess to render the jute goods more competitive

Problem of Modernisation

The spinning section of the industry is almost modernised and new products are being developed to diversify the markets

The main problem is the modernisation of the milling section. For this finance is needed. The financial health of the industry has been poor since long According to an RBI study since 1965-66 profitability has been very low in this industry and the rate of dividend on ordinary capital since then has been around only 3.4 per cent The government's policy is to make funds available for modernisation through Industrial Development Bank of India (IDBI), but the condition is that this should not result undue hardship to the labour Naturally the industry is very cautious about modernisation

The industry was thought to have

TABLE II
Production and Exports of Indian Jute Manufactures

Year ending June	Production ('000 tons)	Exports ('000 tons)	Percentage share of export in production
1951-52	960	808	84 2
52-53	906	687	75 8
53-54	880	824	93.6
54 55	1011	876	86.6

73-74	936	562	60.0
74-75	938	583	62.2

(*Source* : Commerce July 31, 1976)

a bright future in sacking and hessian cloth to be used as bagging and wrapping material. But since 1957-58 carpet backing and other varieties of jute manufactures have become more popular and valuable. At present we are producing about 20 individual items of jute products, according to the 'Annual Survey of Industries'. As one of the biggest foreign exchange earners, the industry is very vital to Indian economy. However today most of the jute mills in India are hovering between survival and closure. Out of 67 mills, 12 mills remained closed in July '76 and many were declared sick. The Indian Jute Mills Association calls the whole industry as a 'sick industry'. Some of the reasons for its sickness originate outside India say unnecessary price war among the producers of jute products. Recently there has been a move for an international jute community. India, Bangladesh, Nepal, Burma and Thailand are the major developing countries producing jute and jute goods These countries had a consultative conference in Dacca in the first week of October '76 They have drawn a programme aiming at stabilising the prices of jute and jute goods and export earnings in real terms Finding out new uses of jute through intensive research is an integral part of their programme They have also announced that their next step would be an international commodity agreement for the setting up of an internationally supported buffer stock of jute and jute goods

The New Agreement with EEC

"An agreement on trade and commercial cooperation in jute" has been made with EEC which will expire on December 31, 1979. A Joint Cooperation Committee has been formed under this agreement which will examine among other things ways and means of diversifying the end uses of jute products The other important tasks for the Joint Council Committee are to make suggestions for cooperation between Indian and European research establishments, and industrial and commercial interests. This jute agreement is in keeping with the Indo-EEC commercial cooperation agreement.

Tariffs and quotas are an important part of our agreement with the EEC. Our aim is to have duty free entry for all the categories of jute goods into the Common Market but until two years from now this aim will not be fulfilled However from January 1977 the highest tariff will be below 5 per cent Jute yarn will find duty free entry from January 1, 1977 into all the nine markets The new agreement has succeeded in achieving progressive elimination of Community quotas and tariffs

So far as UK is concerned today our quotas are about 50 per cent higher for carpet backing and specialities such as wall coverings By the end of 1979 when the recent agreement with EEC expires the quotas will have doubled for the EEC as a whole. Britain and Denmark are already granting duty free entry for all our jute products

However mere elimination of tariffs and quotas will not lead to higher exports Foresight is also needed to push up exports, and the jute interests have to gear themselves to take advantage of the opportunity being made available

Jute industry can survive only if it expands its market. In order to do so R&D efforts and modernisation of mills are a must So far as the unemployment problem with modernisation is concerned, some alternative way has to be found. The issue is very delicate, the government is not in a mood to nationalise the jute industry. Closing the industry may be an alternative but it would result in more unemployment than modernisation of the industry Since spinning section has been only recently modernised it would not be wise to close the industry

The recently formed Jute Manufacturers Development Council may provide an answer The Council will make intermill comparisons in order to weed out the inefficient units It is also raising funds and inviting research projects for financial assistance There is definitely a case for merger of sick units with the efficient ones in the context of modernisation

The recent step of the government to instruct IDBI to look into the modernisation needs of the industry is a step in the right direction and an early action in the matter is required □

AN AUTHORITY FOR THE CAUVERY VALLEY

T.G. NALLAMUTHU

WHILE MANY other states, have more than one major river, Tamilnadu's dependence on Cauvery is so great that any fluctuation in its flow can tilt the fortunes of this state alarmingly For example when the south west monsoon is good, the catchment areas in Mercara (Karnataka) get copious rain and the flow into Mettur is sufficient to irrigate eleven lakh hectares in Tanjavur and Tiruchirapalli districts, after irrigating a few lakh hectares in Karnataka But when the rain is below normal or delayed, as was the case this year, lakhs and lakhs of farmers in Tanjavur and Tiruchirappalli are affected and agricultural production of Tamilnadu and the whole country suffers serious setback

Cauvery is different from other major Indian rivers in many respects Besides depending entirely on the south-west monsoon its flow is far less as compared to even

Cauvery is the life line of Tamilnadu. The 800 kilometre long river flows through its major part in Tamilnadu, enriching the lives of lakhs and lakhs of people.

Krishna and Godavari, let alone Narmada, Ganga and the Brahmaputra The water flow in the Cauvery is only about fifty per cent of Krishna in the best years In contrast water utilisation in Cauvery for irrigation and power is 95 per cent Thanks to the foresighted leadership of the Chola Kings and pioneering engineers of Karnataka, Cauvery was harnessed over a hundred years ago for the welfare of the people That is why the Cauvery water dispute is much different from other water disputes, and needs urgent solution While in the case of Narmada, Godavari and Krishna water is being wasted into the sea pending an agreement among the concerned states, in the case of Cauvery, not a drop of water is wasted While the delay in the settlement of other river water disputes does not much affect the existing irrigated areas and existing agricultural production, in the case of Cauvery the continued dispute threatens the life of lakhs and lakhs of farmers in Tanjavur and Tiruchirapalli and also the economy of the state It is in this context that the centre has seized the initiative and taken upon itself the responsibility to solve the dispute instead of referring it to a tribunal for arbitration. The experience of other river water disputes has shown that tribunals take several years and in the end the award is rejected or not implemented by one state or the other. Therefore, the present effort to find a lasting solution to the Cauvery waters dispute is very welcome

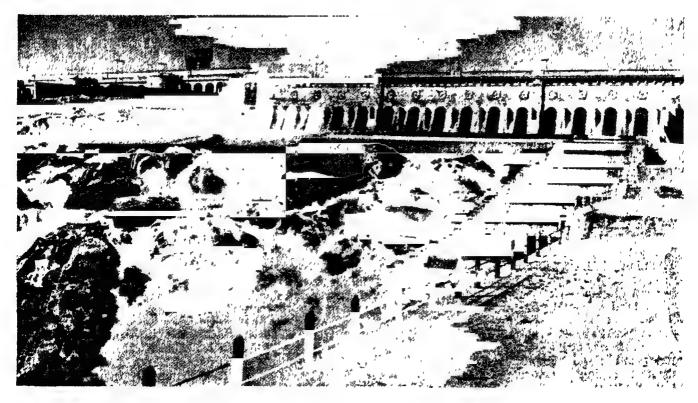
Shri Nallamuthu is Senior Correspondent, AIR, Madras.

The Mettur reservior holds the key to the irrigation potential of Tanjavur district, considered to be the granary of Tamil Nadu

The Cauvery waters dispute is almost a century old. Tamilnadu was the first to utilise the Cauvery waters because of the vast delta in Tanjavur. The water was impounded in Mettur and Kallanai for irrigation. The first agreement between Tamilnadu and Karnataka was reached in 1892 over the construction of a dam across the Cauvery at Kannambadi near Mysore Dispute arose whether it should be a mere power project or it should cover irrigation also. Therefore another agreement was reached in 1924, enabling the construction of a dam for irrigating 50,000 hectares, while at the same time ensuring a certain minimal water flow into Tamilnadu. This agreement was to be renewed after fifty years Therefore efforts were started in 1968 to reach a new accord. Meanwhile Kerala joined the dispute and said that the 1924 agreement was not binding on it and it was free to utilise the waters of Kabini and Bhavani, the two tributaries of Cauvery which have their origin in Kerala Meanwhile, Karnataka declared that the agreement had lapsed and therefore it was free to utilise the water as it desired. This caused anxiety to lakhs and lakhs of farmers in Tamilnadu during lean years The last round of talks was held in November 1947 when the three chief ministers came very near to an agreement In fact they agreed in principle, to set up a Cauvery Valley Authority, but differences on the quantum of water now being utilised by the states and the amount of water that could be saved by Tamilnadu and Karnataka could not be bridged and therefore the accord was stalled. Thanks to the new spirit of understanding and mutual, cooperation generated has the emergency, an agreement has now been made possible though much headway is yet to be made with regard to the actual sharing of the waters both during normal years and lean years. The sense of urgency displayed both by the centre and the states is enough proof that final solution is round the corner.

Hogenakal falls on Tamilnadu-Karnataka border can yield 250 MW of Power

The cauvery valley authority will be the second of its kind in the

A view of the Krishna Raja Sagar Dam, Karnataka


OUR CORRESPONDENT PASSES AWAY

THE CHIEF EDITOR and the members of the staff of YOJANA deeply regret to announce the untimely death of their distinguished colleague Shri Siddharthan Kariyal on February 10.

Still in his thirties, Shri Kariyal was a brilliant journalist and as a Correspondent he had undertaken a number of tours to report on development and change Among his most distinctive contributions were his reports on Sikkim, the Andaman and Nicobar Islands and Arunachal Pradesh.

Shri Kariyal is survived by his mother, wife and two children.

The sprawling Cauvery River, irrigates lakhs of hactares of land in Tiruchi and Tanjavur districts. Tiruchi Rock Fort can be seen in the background.

country, after the Damodar Valley Authority. The decision to set up an authority instead of merely finding the solution on the share of the three states indicates that the centre will continue to exercise supervision and control over the planning and execution of future projects and the integrated working of the existing projects for the most economic use of natural resources

The exact functions of the authority have yet to be decided by a committee of secretaries of the three states and it will be considered at the next meeting of the Chief Ministers. Another committee representing the three states and the centre will work out the manner of sharing the available water in lean years. The committee will also work out quantities of surplus water that might be presently available Another important highlight of the agreement is on economising water use in the delta, so that the surplus could bring more and more hectares under permanent irrigation. In this context the Centre's assurance that the savings will not affect the existing requirements of established ayacuts, has been welcomed by the people of Tamilnadu.

The Tamilnadu Government has already made a perspective plan for the modernisation of the canal system for improved water management and the world bank has also shown some interest in it This project will be a gigantic one and will take at least fifteen years to yield substantial result In fact according to the perspective plan, the remodelling and relining of canal systems in the state will require over Rs 3000 million Raising so much of resources will be difficult, but the determination of the centre and the states to bring more land under cultivation for increasing agricultural production would go a long way in achieving this object

The New Delhi agreement is a landmark, throwing open possibilities of greater use of the existing flow For example, the water fall at Hogenakkal on the Karnataka Tamilnadu border could be used for the urgently needed power (250 MW) as well as irrigation in the backward areas of the region. There is also scope for reuse of the flow below Mettur for generating more power (300- :00 MW) All these projects and many more had been held up for want of a climate of understanding and cooperation among the concerned states. With the new agreement there is no doubt that thousands of more hectares of land will be brought under irrigation in the Cauvery valley contributing to India's self sufficiency in agricultural production. □

Yojana Quiz

1. Name the following·
   (*i*) Bird that never builds a nest
   (*ii*) City of Sky scrapers
   (*iii*) Reptile that changes its colour
2. What is the importance of the following dates in Indian History?
   (*a*) 2 October, 1869
   (*b*) 8 August, 1942
   (*c*) 20 October, 1965
   (*d*) 18 May, 1974
3. What is the
   (*a*) Biggest planet
   (*b*) Largest Ocean
   (*c*) Longest lake
   (*d*) Planet furthest from sun
4. Where the following units are situated?
   (*a*) Bharat Dynamics Ltd ,
   (*b*) Bharat Earth Movers Ltd.,
   (*c*) Mishra Dhatu Nigam
   (*d*) Garden Reach Workshops
5. With the exception of two rivers the trend of the rivers of Tamil Nadu is from west to east down to the Bay of Bengal. What are those two rivers?
6. The only Indian incidence of wild horse is reported from.
   a) Gir forest, Gujarat
   (*b*) Sundarbans, West Bengal
   (*c*) Vedaranyam in Tamil Nadu
7. The Champion Reefs Gold mine—one of the deepest working mine in the world is in
   (*a*) Karnataka, India
   (*b*) South Africa
   (*c*) California, USA
8. With what games do you associate these
   (*i*) Bye
   (*ii*) Cannon
   (*iii*) Chinaman
9. Name a metal that is not solid?
10. What weight of air do we carry?
11. Why does an individual's nose run when he cries?

Answers

1. (*i*) Cuckoo, (*ii*) New York, (*iii*) Chameleon
2. (*a*) Birth of Mahatma Gandhi. (*b*) Quit India Movement was launched by the Indian National Congress. (*c*) Chinese invation of India. (*d*) India's first atomic explosion at Pokhran in Rajasthan
3. (*a*) Jupitor, (*b*) Pacific, (*c*) Caspian Sea, (*d*) Pluto
4. (*a*) Hyderabad, (*b*) Bangalore, (*c*) Hyderabad, (*d*) Calcutta
5. The Kodaiyar and the Pazhayar
6. (*c*) Vedaranyam in Thanjavur district, Tamil Nadu
7. (*a*) Kolar Gold Fields, Karnataka, India with a depth of 2,885 metres.
8. (*i*) Cricket, (*ii*) Billiards, (*iii*) Cricket
9. Mercury
10. 14.72 lbs per sq inch.
11. When a person cries, some tears gather in the eyes and there is a watery discharge from the nose when tears are carried from the eyes to the nasal cavity

Quotation Box

No other developing country really has an open society as we have. Most of them have much one-person-catred systems.

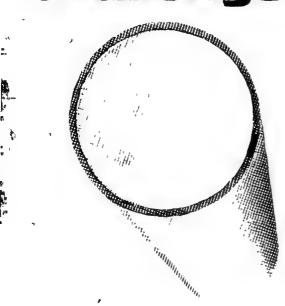
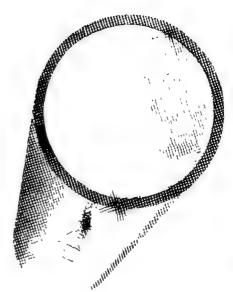
The Wall-to-Wall Challenge




Take a close look at a bazar tube It is thin-walled Also, it isn't galvanised properly, the zinc coating is thin and patchy You naturally pay less for this tube—but in the long run it will cost you more because it will not last long

Examine an ITC tube, popularly known as TATA pipe. It has a thicker wall—complying with the specification IS: 1239 (Part I)—1973 It is also properly galvanised. You pay more for right quality—for long years of trouble-free service.

The strength of your tubes lies in the wall thickness

Correct wall-thickness of ITC tubes enables threads to be cut to perfect form, leaving adequate material at the root This ensures strong and reliable joints that don't break or leak

Protected against corrosion

The duration of protection given by zinc varies directly with the thickness of the coating applied ITC galvanised tubes (G I pipes) have a zinc coating that always meets the requirements of the specification.

Stress-free

ITC tubes, made by the Fretz Moon process, are free from any kind of stress since the forming, welding and sizing are done in the hot state. Being hot finished, ITC tubes can be cold bent.

ITC the most trusted trade mark in steel Tubes

Cooperative Banking
A New Approach

ANAMOL SINGH

UNDER THE CHANGED order during 1975-76 the nation has witnessed several outstanding attainments such as a growth rate of over 5.5 per cent, putting the economy back on its normal growth path, price stability with a check on inflation, significant rise in the rate of domestic saving and investment and a move towards an eventual emergence of a viable external payment position. The Cooperative Banking has also taken great strides after the declaration of internal emergency and the inception of New Economic Programme in mid-1975 An unheard growth rate of 8 per cent in agriculture sector proved a reality during 1975-76 partly due to favourable weather condition and partly due to a high level of investment in the agricultural economy.

This for instance is reflected in substantial increase in the agricultural inputs like better seed, fertilisers, insecticides, power and water The performance in respect of good grains production was particularly noteworthy Total production of foodgrains is expected to establish an alltime record of over 116 million tonnes. This would have not been possible if a network of 26 state cooperative banks, 341 central cooperative banks, 1,53,000 primary agricultural credit societies and 19 central land development banks functioning in the country had not rendered yeoman service to the agriculture sector by pumping required capital through their lending programmes and projects.

Cooperative Credit Policy

The main aim of the Cooperative Credit Policy during 1975-76 continued to be to subserve the national objective of development within the framework of monetary discipline. The main emphasis continued to be on the reduction of regional disparities in cooperative credit development and the narrowing down of the existing credit gaps. The principal programmes undertaken are (1) reorganisation of the primary agricultural credit societies into viable/potentially viable ones (ii) organisation of new societies like the Farmers' Service Societies (F.S.S) and large sized multipurpose societies (LAMPS) particularly in the tribal areas, (iii) rehabilitation of weak central cooperative banks and state cooperative banks, (iv) gearing the movement to meet the needs of the weaker sections of the community, (v) toning up of recovery, (vi) introduction of universal membership, (vii) observance of financial discipline and seasonality in advancement and recovery, (viii) linking of borrowings of cooperative banks' with their efforts to mobilise deposits, (ix) provision for common cadres and trained staff, (x) arrangement for a full time, capable top executive as managing director especially at the state level.

Twenty Point Economic Programme

Cooperative banks paid special attention to the implementation of 20 point economic programme As the measures taken for the liquidation of rural indebtedness considerably dried up the credit line from non-institutional sources such as money lenders, the task of distributing consumption loan at the instance of Government of India and R.B.I. was taken up by cooperative banks and societies.

Provision for the loans to individuals against gold and silver ornaments were also made. With a view to making alternate sources of institutional credit available to the borrowers affected by debt relief measures, loans for consumption purposes were allowed along with production credit to farmer members of primary credit societies belonging to weaker sections for specified purposes such as medical aid, education, death ceremonies, marriages etc. The quantum of such loans however was limited to 10 per cent of the total short term advances or Rs. 250 per member whichever is less. Cooperative banks were also permitted to grant jewel loans to individuals not exceeding Rs 1000 per borrower but the aggregate of loans and advances of all types against individuals should not exceed 10 per cent of the banks' total time and demand liabilities.

Till the end of November 1975 as many as 12.5 lakh small and marginal farmers and agricultural/landless labourers were identified as eligible for benefits under the S.F.D.A. schemes. Of these 6.1 lakh were enrolled as members of cooperatives during the period July, 1975 to November 1975. Short term loans to the extent of 193 million were distributed to these members through cooperatives. In addition medium term and long term loans to the tune of Rs 84 million have been issued to them by cooperative banks since the inception of the scheme. The state cooperative banks ensured that not less than 20 per cent of the central cooperative bank's advances to primary credit societies were issued for financing small/economically weak farmers. Drawals on the credit limits in excess of the free portion (generally 60 to 70 per cent of the limit) were required to be matched by corresponding advances issued to societies for financing such farmers.

Under the public distribution system for supply of essential goods, the recognised primary agricultural credit societies, the F.S.S. and the LAMPS are to attend distribution work in the rural areas. These societies were made eligible for additional share capital contribution in excess of the normal limit of Rs 10,000. Involvement of the funds of central cooperative banks in financing these societies for this purpose has been agreed upon. It has been made a legitimate charge on their funds. To meet the growing

---

Shri Singh is Lecturer in the Cooperative Training College, Lucknow.

working capital requirements of Urban consumer stores in this context, urban cooperative banks have been entrusted with this responsibility.

The principal areas in which cooperative banks are assisting in the implementation of 20 point economic programme are (i) assistance to the landless labourers and other weaker sections of the community who are being allotted land and house sites, (ii) assistance to those released from bonded labour for undertaking viable productive ventures, (iii) increased flow of credit to take care of credit gaps created by the moratorium on recovery of debt from landless labour, small farmers and artisans and progressive implementation of the programme of liquidation of rural indebtedness, (iv) support to programme for supply of essential commodities and (v) assistance to handloom weavers.

TABLE I
Progress of Cooperative Credit Movement in India

(Amount in Rupees Crores)

Types of Institution	Cooperative Year		
	1972-73	1973-74	1974-75
Central Cooperative Banks			
(1) No.	349	341	391
(2) Owned Fund	254	281	314
(3) Deposit	647	719	812
(4) Working Capital	1412	1595	1838
(5) Loans issued	1246	1246	1520
Primary Agriculture Credit Societies			
(1) No (in thousands)	155	154	153
(2) Membership (in thousands)	33528	34956	35851
(3) Owned Funds	323	353	391
(4) Deposits	84	89	97
(5) Working Capital	1265	1360	1523
(6) Loan issued	776	762	889

Task Ahead

A lot has been achieved, yet much remains to be accomplished by the cooperative banking movement. Large credit gaps still persist in our agricultural economy leaving the productive needs of a large section of our population starving. Fields still stand unlevelled, unreclaimed and eroded. Vast tracts of land still have no irrigation facilities Old and outdated agricultural tools have not still yielded place to modern and improved implements Improved methods of cultivation and application of optimum dose of inputs have still to be adopted by a sizeable group in the country side. Modern agricultural machinery is still rare.

A large section of our population, particularly the weaker sections have not joined the movement yet A majority of those who have joined, are not availing of any facility from the cooperative credit organisations Of those who have dealings, majority do not make use of various facilities adequately. Though many formalities to make them viable have been observed, the real strength and vitality have yet not come. Their operations are still lopsided and the so called good of diversification of services is far from realisation. The basic function of resource mobilisation is not up to the mark resulting in chronic dependence over external sources. The genuine orientation of lending operation to productive needs has still to be attained. Poor recovery and large overdues are still a great menance to the movement. Factional politics, officialdom and vested interests are hovering over the institutions making their management uncooperative and unbusiness like.

A remedy has to be found as there exists no alternative. The solution lies only in the human element associated with these organisations be they officials, or non-officials or employees. First and foremost necessity is to tone up the administration at official levels make it sincere, dedicated and honest to the purpose. They are to be imparted necessary skill and made responsive to the needs of the movement. Necessary sense of discipline is to be inculcated among them to make them really the friend, philosopher and guide of the movement. To rule and to interfere is none of their business. It should be made clear that they are to guide, control and to direct the activities of the institution.

Similarly, in case of non-officials a code of conduct should be evolved. A fool-proof system is to be developed to check misuse of power, position and the resources. Self guided flights, tours, persuance of political ends and other such decisions by them are to be curbed. This class as a whole should be aware that their role is to take only policy decisions and not interfere with the execution of the decisions which is the responsibility of executives Only men with the necessary background and expertise can run cooperative business. There should be full cooperation and close mutual check and counter check between the official wing and non-official wings. The class which needs utmost care is that of executives and employees working in the institution. As a matter of fact, the future of the institution depends to a large extent on the quality of staff at its service. If they are adequate, qualified, trained, efficient and responsive, the institution is bound to grow and prosper. This will not happen on its own unless there is a just and effective system of employees recruitment, selection, orientation, placement, training, promotion, compensation. incentives, working conditions, service conditions, and welfare activities and amenities This doubly holds good in case of few key executives. This three sided approach to the human element accompanied with time-bound, need-based and closely supervised action plan may prove a panacea for the movement. □

THERE CAN BE

NO DEMOCRACY

WITHOUT DISCIPLINE

P. P. Dichloro Diphenyl Trichloro-Ethane, or DDT as it is commonly known was discovered by Prof. Paul Muller in 1939, when the era of synthetic pesticides began. DDT was introduced in India in 1947-48, and actual production commenced in 1956 Since then, its use is steadily increasing and 4200 tonnes of DDT was consumed in 1975. In comparison to other pesticides, DDT is effective, cheap and remains active for long periods of time both in inorganic and biological environment. Its excessive use poses health hazards not only to livestock but even to humans. However, its plus points are more than the minus ones and one cannot discard it entirely. The author discusses these in detail in this article on,

HEALTH HAZARDS OF DDT

R.C. GUPTA

IN THESE DAYS of intensive agricultural practices, pesticides are invaluable in the promotion of farm productivity and protection of agricultural products during storage, besides their use in the control of certain waterborne diseases such as malaria, typhus, yellow fever, etc. To avoid the annual damage to agriculture by insects, noxious weeds and rodents, estimated at Rs 5,0000 million, in our country, the use of pesticides is steadily increasing both in tonnage and in variety The excessive, use of pesticides however is posing health hazards not only to livestock and wild life, but even to human beings, either directly or indirectly through the food chains. Besides, pesticides could have other damaging consequences such as adverse effects on soil fertility and phytotoxicity They can also interfere with desired use of soil and water, causing major problems of pollution However, serious incidents as a result of pesticide use are yet to happen in India and the total ban on the use of DDT in countries like America and Canada is a warning to others. It is, therefore, imperative that the problems arising out of the increased use of pesticides, particularly DDT, in this country are throughly studied to avert an ecological catastrophe.

Exposure to DDT

During use, human beings are exposed to DDT at the time of production, formulations, packaging, transportation and application to vegetation. These occasions provides opportunity for contact, inhalation and even ingestion of toxic constitutes of DDT. In addition to occupational exposures entry into the food channels of man and his economic species may occur through residues in or on raw agricultural commodities or in processed or packed foods produced therefrom Thus traces of DDT may be ingested by the young and old, the sick and the healthy and for long or short periods at various stages or even through out life. This led to the monitoring of various food stuffs in the different parts of the country. The details of which are discussed below and summarized in Table 1.

Cereals, pulses and their products

A total of 314 samples collected from various sources such as farmers' houses, FCI Godowns and markets of Hyderabad, Delhi, Mysore etc. were analysed by different workers. Seventy four per cent samples were found to contain residues of DDT. A personal communication from Dr. K. Krishnamurthy of the Indian Grain Storage Institute, Hapur, revealed that mixing of DDT with the grains is a common practice in villages around Hapur and Delhi.

Operation of gas liquid Chromatograph for analysis of DDT in our food stuff.

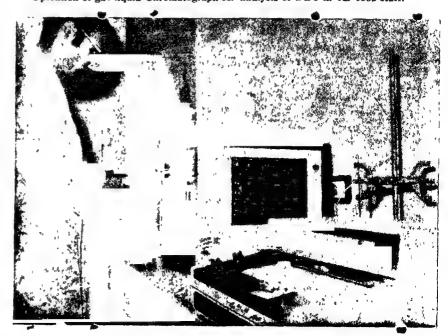
Shri Gupta is a Scientist in the Industrial Toxicology Research Centre, Luckno.


TABLE 1

DDT contamination of food samples

Commodity examined	No. of samples examined	No. of samples found contaminated	Residue level (ppm)
Wheat grains	219	182	0.05 — 6
Wheat flour	2	2	12 — 15
Cereals	77	34	Tr. — 0.8
Rice	4	4	9 — 16
Pulses	12	12	5 — 35
Oil seeds	15	15	1 1 — 41
Oils	14	8	5.0 — 25.7
Vegetables :			
Beans	6	6	0.4
Ladies finger	10	5	1.0
Brinjal	31	17	0.08 — 8.0
Cabbage	8	3	Traces
Potato	18	18	0.1 — 169
Tomato	20	5	0.05 — 0.08
Milk	5	4	0.003 — 0 005
Butter	5	2	0.4 — 0.5
Eggs	6	6	0 04 — 0 02
Fish	2	1	Traces
Fat of buffaloes, goat and cows	63	61	0.538

Oilseeds and Oils · Twenty nine samples of different oil seeds and oils from Delhi have been reported to contain DDT. The residues were very high in mustard oil, sesame oil and coconut oil while samples from Hyderabad did not contain any DDT

Vegetables · Out of 93 samples, as many as 54 samples (58 per cent) are reported to contain DDT which in a majority of cases was higher than the tolerance limit set by the Food and Drug Administration of U.S.A

Milk and Milk products . Out of 5 samples of milk from Pantnagar 4 contained DDT and analysis of two samples of butter also contain DDT below 0 5 ppm.

Eggs : Six samples of eggs collected from Pantnagar are reported to have contained DDT which was higher than the tolerance limits laid down by the authorities

Fish and Meat · Out of 65 samples of fish and fat from buffalo, goat and cows from Hyderabad and Pantnagar, 62 samples contained DDT

Storage of DDT in body tissues of man

On direct or indirect exposure of human beings, DDT tends to accumulate in their body fats. Studies have shown that the daily content of DDT in meal in our country might be about 0.2664 mg. while concentrations of DDT in body fact vary from 12.8 ppm to 31 ppm. This level of DDT in human fat is the highest in the world; the level of DDT in different countries of the world has been reported to contain 1.8 ppm to 19.2 ppm. (Table 2) The effects of higher concentration of DDT on man have been undesirable and alarming. Some disturbing effects could be related to cause many human and animal diseases like influenza, hepatitis, cardio-vascular derangements and even cancer, mutations and congenital *in utero* malformation. It is also believed that DDT may promote fungus infection, allergy, sinusitis, gastro-intestinal troubles, dehydration, malnutrition, pneumonities, and sometimes even to impotence and insanity.

TABLE 2

DDT in body fat of human beings in different countries

Country	Total DDT (ppm)	Per cent DDE in total DDT
Australia	1.8	56
West Germany	2.3	57
England	3.3	67
Denmark	3.3	82
Canada	4.9	67
Italy	5.0	64
France	5.2	67
Czechoslovakia	9.6	43
Hungary	12.4	48
Israel	19.2	56
India	12.8 — 31	37

Remedial Measures

Although DDT is a major long term contaminant of the total environment yet, when one puts the benefits and the risks of DDT in the balance, one finds the needle clearly pointing towards the wisdom of continuing the use of DDT in agriculture and public health programmes till a substitute of DDT is discovered. It is, therefore suggested that one should follow strictly the following safety measures:

1. DDT should be applied only in recommended dosages to crops when pest population has exceeded the economic threshold, i e, the level at which a significant crop loss may be expected if not controlled
2. Cattle should not be allowed to graze on the treated crops
3. The produce should be harvested after the waiting period is over.
4. Legislation should be passed to ban the mixing of DDT in food grains and farmers should be advised to use malathion and pyrethrum as food grain protectants in recommended dosage.
5. Consumers should be advised to peel, scrub or washed throughly with water all the vegetables and fruits before use, because such home processing of agricultural produce removes 80 to 90 per cent DDT residues. □

International Co-operation in Bio-Gas Technology

SUBHASH J. RELE

EXCEPT GIVING A fillip to the hotel business, seminars and workshops are not normally result-achieving. A week-long international workshop jointly sponsored by the United Nations Economic and Social Commission for Asia and the Pacific and the National Committe on Science and Technology on Biogas Technology and Utilisation was, however, an exception. The ESCAP needs to be complimented for its initiative in bringing this so-far-neglected subject on the international stage for the welfare of the poorer nations. Thanks to the oil crisis, the ESCAP countries have woken up to the new realities facing them and also given them an opportunity to develop their own resources. It was good to know that there is now no mystique about Bio-gas Technology in ESCAP region.

The objective of the Workshop was to develop an unconventional source of energy from renewable resources and to improve the value of organic waste materials for use as fertilisers. Besides India, the countries which participated in the workshop included Bangla Desh, Bhutan, Indonesia, Malaysia, Nepal, Pakistan, Fiji, Republic of Korea, the Philippines, Papua New Guinea, Thailand and Samoa. It is not encouraging to note that the governments in ESCAP countries are now convinced of the vast potentialities of bio-gas as an important source of fuel and organic manure. Some months back a preparatory mission of the ESCAP had visited a few selected countries of the region, and its report foresaw a great future for the development of Bio-gas plants in the region

Often, subjects like bio-gas do not receive the attention they deserve as do the sophisticated technologies Our ivory tower planners disdain the Bio-gas Technology as a reversion to the primitive methods of obtaining energy. They do not agree with the view that the bio-gas plant is an example of making a little go a long way; of finding multiple uses for a material found all over India. While inaugurating the workshop, Mrs. Indira Gandhi stressed the need for the evolution of intermediate technology approach to the special condition in the countries of the ESCAP region.

Shri Rele is a free-lance writer

The participants discussed the various technological, economic and social problems of bio-gas programme The bio-gas plant has several advantages. It can operate successfully on a small scale with a gas output as low a 2 cubic metres per day. This again is a subject on which further work has to be done Participants, however, were agreed on this The operation of these plants will not only help solve the increasing unemployment problem in ESCAP countries, but will also generate sufficient power and energy. Several novel ideas were thrown up. The main thrust of the proposal was the formulation of a national programme by each country of the region with the involvement of local government institutions as also the statutory bodies. There was a consensus among the participants on the need for an integrated programme for bio-gas system on the development of fuel, fertiliser and food There was no hair-splitting here. The participants who came out in favour of intermediate technology to solve some of the burning problems of the ESCAP region were expressing a point of view that is now shared by a number of countries and people. Belatedly though, they realised the danger accruing from attaching too much importance to urban-oriented sophisticated technology. Again countries can learn a lot from one another. In fact, the general tone reflected a pragmatic approach There was, of course, nothing original in the plea for preparation of training manuals for planning, design, construction, operation and maintenance procedures But the plea is not less relevant for the matter. The workshop suggested a planned approach for setting up bio-gas plants in the country of the region. In view of the significant role which bio-gas technology can play in rural development, the workshop propo ed provision of adequate faciliti for fabrication, construction, desig and operation of bio-gas plan elying on local materials. This tech nology can serve as a spring-boar for hastening the pace of rural deve lopment. The workshop called fo adequate financial assistance an incentives to the programmes. Th conviction is growing that interna tional cooperation for specific acti vities like training, research, ex change of equipment, etc. could worl wonders.

Plenty of waste that can be Converte into Energry

It is now admitted that the tre mendous resources of vegetable an organic wastes in our country an the world over could make avail able a huge amount of energy t meet the farmers' needs in the coun tries of Asia and the Pacific region Implementing a wide-ranging bio gas programme is a propositio calling for different kind of involve ment motivation. There is no reaso to believe that the ESCAP regio lacks in this.

As far as India is concerned, fourteen-year long efforts by the Khadi & Village Industries Commission have resulted in a "rich harvest" of bio-gas plants all over the country and to-date over 15,000 such plants have already been constructed The Fifth Five-Year Plan envisages the installation of about 1 lakh such plants As the energy crisis is unlikely to ease in the foreseeable future, the need for setting up more plants than the envisaged ones is very urgent. The excuse of financial stringency cannot stand any more. The commercial banks have shown enough initiative in financing the plants. The Union Government is giving 25 per cent of the cost of setting up a plant as a subsidy. There is no reason why this cannot be doubled. At present, attention is being focussed on how to maintain the level of gas production during the cold weather especially in northern India. So also is the question of raising the productivity of gas manufacture in a given time so that the size of the plant and its cost could be reduced. The KVIC, meanwhile, perfected the techniques of utilizing the slurry for compost making and using the gas for running an engine. It is the most cheering news that the KVIC is going in

(*Contd. on Page* 34)

REGIONAL REPORT

Young Entrepreneur's Feat

RAMAN PATEL

Ahmedabad Correspondent

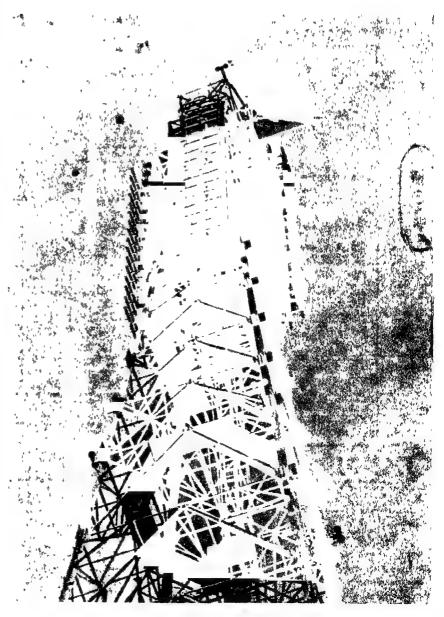
HOW A YOUNG mechanical engineer, with perseverance and determination, can push his way forward and contribute his mite in the nation building effort is illustrated, in the person of Shri Sham Antoorkar. Antoorkar has developed, designed and fabricated two types of antennae, one for the TV transmitter and another Parabolic dish type antenna, for the use of the Indian Space Research Organisation (ISRO). It is perhaps for the first time that such antennae have been made in this country. Prior to this successful effort, we were importing such types of antennae.

Antennae form a very vital part in the telecommunication system and have a wide range of applications in the Defence, Posts & Telecommunication, TV and AIR broadcasting etc. His antennae found ready acceptance by the ISRO when the country embarked on the SITE Programme. ISRO set up a TV transmitter at Pij near Nadiad for its experimental TV Programme. Antoorkar's antenna, which came in handy, fulfilled all the specifications and requirements stipulated by ISRO.

Antoorkar graduated as a Mechanical Engineer from Aurangabad (Marathawad University) and struggled hard for two years to make his own mark. He served with a small chemical engineering factory where he developed "metal coated oxide resistors" which have a longer life and better performance compared to the traditional resistors, which are used in the electronic industry. This drew him in the field of Electronics. He approached the Principal of M.G. Science College, Ahmedabad with a request to allow him to conduct his experiments. He was allowed to use the college laboratory and his products stood the tests, taken at the Physical Research Laboratory, Ahmedabad. Success in all these efforts, encouraged him to fabricate a transmitter antenna. The antenna system fabricated by him costs between Rs 2 and 3 lakh against the cost of the imported one which varies between Rs 5 and 8 lakh depending upon the variations in specifications. Antoorkar has also fabricated an antenna called the "Low Range Broadcasting System", which costs only about Rs 1 lakh, and is much cheaper than the TV transmitter antenna.

He has set up his own small manufacturing unit with the help of loan assistance from a nationalisd bank.

He has also designed and fabricated successfully what is called the "Computer Stationary Manufacturing Machine" with a production capacity of 100 ft. of perforated paper per minute. The machine can produce perforated paper, required for computers, in desired sizes and shapes. □

A parabolic dish type antenna built for the first time in country


Alphabetic literacy is important for the citizen, society and the Nation's progress. Independent of this form of literacy, science literacy however aims at achieving a certain level of science knowledge in the citizen. Today science confronts the citizen on many related public issues such as health, energy, food, agriculture, natural resources, outer space, communication, environment, transportation etc. Science literacy should make citizens not only conscious of these issues but also help them apply science more effectively in day-to-day life and avoid its pit-falls says

Dr. ZAKA IMAM

SCIENCE LITERACY

A Solution to our Many Problems

IT IS ESTIMATED that close to a billion people in the world today live in deep poverty with no access to scientific knowledge on such basic issues as health, nutrition and modern agriculture which could ease their sufferings considerably. There are no two opinions that knowledge is good But in the world of today when science affects almost every aspect of our lives, there are people who have low to practically zero level understanding of the current developments in various fields of science

Science is the major organ of enquiry in human society for exploring into the nature It is however not needed to be merely directed to satisfy man's desire out of his curiosity to know the nature Instead, its objectives (perhaps ever changing in demand) to name a few, are finding, a long term solution to man's problems of not only desired material gains in the form of food, shelter and clothing for all but also in achieving realization by all of the equality and dignity of all mankind, finding solution to confrontations in the world, preserving man's environment and finding out future resources as well as inhabitable places or possibility of inhabitating the outer space And, therefore, while emphasis on science to explore more and more of the vast potentials of the world (universe can be the limit) continues, man in the street needs to be adequately informed about the achievements of science and future impact of science on the society. This is important because the society is not only constituted of scientists, in fact majority is that of non-scientists. And of course for many other reasons too such as (i) to make best use of the scientific knowledge by the society, (ii) to involve public in debate on science related public issues and science policy and (iii) to make public know how good public fund that goes in scientific research is put to An understanding of science in the public mind, therefore, so as to make it understand the application of science in the best possible way and to gain an approach and develop a scientific insight to participate in science related public issues in the rational way and to avoid pitfalls of science is the aim of what we can call the science literacy.

Science Literacy

This is independent of alphabetic literacy because it can be achieved through ordinary language science (popular science) using media like radio, television, documentary film on science and photographic exhibitions. For literate people, however, science writings in ordinary language are an additional means of achieving science literacy Science literacy can be of a varied nature from knowing how to put together a nutritious meal to knowing how to enjoy the laws of physics

The Gap

At the root of many of our problems are socio-economic inequities which are further aggravated by an another type of gap, "the science information gap." Scientific research and development is one thing and its application by the society for whom of course science is meant, is the other thing. The interactions between science and the society ar[e] best possible by filling this informa[-]tion gap by the use of ordinary lan[-]guage science aimed at setting up [a] standard of science literacy. Scienc[e] with no access to knowledge gaine[d] through science, to the public mee[ts] a dead end. That is, if there exis[ts] a gap between scientific achieve[-]ments and the public knowledge t[o] grasp the applications in the righ[t] way, we can expect many odd re[-]sults. One such example to quote i[s] from a family planning doctor wh[o] was once visited by one of he[r] patients complaining that she (th[e] patient) had conceived despite us[-]ing the method advised by her (th[e] doctor). The doctor, naturally asked the lady if she ever misse[d] the devise The lady confessed tha[t] she used it always the way docto[r] had explained, "I pulled the condo[m] on the thumb of my husband ever[y] time before intercourse." Imagin[e] there are people around so ignoran[t] of the very basic biological fac[t] that pulling condom on thumb woul[d] not prevent of conception. Perhap[s] the lady thought that condom coul[d] work like magic. Science is no mag[ic] but phenomena based on the fac[ts] of nature. The very common sens[e] which people apply elsewhere fail t[o] apply where it concerns science. O[r] conversely people fail in applyin[g] science where science could hel[p] solve their problems Like othe[r] countries, specially under develop[-]ed and developing countries, w[e] have social and religious taboo[s] customs and prejudices which ar[e] not only irrelevant but scientificall[y] absurd Science literacy can def[i]nitely help root out such road block[s] in the passage of the country' progress.

The Problems

Present day confronts citizens wit[h] many science related public issue

such as health, energy, food, agriculture natural resources, outer space, communication, the environment transportation etc. Science literacy, therefore, can make a citizen not only conscious of these issues but also make them capable of drawing common sense Judgements to apply science effectively. Use of modern appliances and techniques in agriculture all need some level of science literacy.

Under nourishment or over nourishment (two forms of malnutrition) can be found in human populations the world over, the first being, however, predominantly a problem of the underdeveloped countries Malnutrition diseases, such as kwashiorkor and marasmus, are now known to be not mere consequence of protein deficient diet but also related to mother's less efficiency and stupidity. Educating mothers in hygiene, nutrition and child care can solve these problems directly and at a much faster speed than by launching programmes to feed the under nourished Of course supplementing diet by providing milk and soya products will also prove effective. Though socio-economic inequities are at the root of many such problems, the popular science covering topics on major issues such as health, food and agriculture, by way of achieving the required level of the science literacy, can offer atleast a partial antidote. Acquisition of knowledge, that prerequisite to good health, is a properly balanced (nutritive) diet, can lead to considerable achievement in solving the problem of malnutrition. For example, children and adults alike can be made to learn the benefits of taking seasonal fruits and other nutritive food instead of *chaat* which can spoil one's appetite (it is an observable fact that often bad food habits and intake of low dietary food is not related to one's poor economic status but to negligence of dietatics). Knowledge that so called refreshing cold drinks have poor nutritive value can put one to the best use of his money by going for sugar cane or fruit juice. Infectious diseases in a community can also be avoided by the use of science literacy. Besides these, every couple can best understand its role in the population balance of the country and get rid of inhibitions and prejudices and take up family planning, if they reach a certain level of science literacy. The family planning would then come natural to masses. That likewise illiterate, literate also needs to be informed through popular science, is evident from the growing menace of modern mothers not breast feeding their infants. This is due to the ignorance of the factual scientific information that the nature's best comes in the mother's milk. And conversely also attracted or misguided by the advertising practices of manufacturers of infant formulas and weaning foods, and partly for fashion, the mothers deprive their near and dear of this boon. Admixed with misconceptions and prejudices it is customary knowledge among such mothers that breast feeding destroys one's figure, though breast feeding does not Instead it provides antiinfective nutritional food very much needed for the development of human central nervous system There is an old wives tale that breast feeding has a contraceptive child spacing effect and this effect has been proved to be scientifically correct

Science Literacy—Three Forms

Prof. Benjamin S.P. Shen of the University of Pennsylvania has distinguished science literacy into three forms: 'Practical', 'Civic' and 'Cultural science literacy'. According to him all these three forms of science literacy besides their difference in objectives also differ in audience, content, format and means of delivery. Among the various forms, according to Benjamin, practical science literacy is one of utmost importance because it aims at directly influencing the living standard of masses because a little of scientific information can mean difference between health and disease, life and death. The use of communication satellite ATS-6 in India, to deliver health and agricultural information to villages in some states, is cited by him as the example of the efforts to achieve this sort of science literacy In his words: "The aim of the civic science literacy is to enable the citizen to become more and more aware of science and science related issues so that he and his representatives can bring their common sense to bear upon them and, in this way participate more fully in the democratic processes of an increasingly technological society". Dr Benjamin also points out that general hesitation in the face of scientific issues stems mainly from lack of familiarity with them and science in general. The cultural science literacy, though of no direct use, develops out of one's curiosity to know science. It is like science student reading literature, learning music or enjoying poetry. But, the cultural science literacy does not extend beyond intellectual community.

Popularisers Needed

To achieve science literacy there is need for skilled popularisers, who can make scientific subtleties clear to the layman with the help of writings and audiovisual media Fresh graduates in science with aptitude for this vocation may be encouraged to take carrier in science writing or preparation of material on science for the mass media by granting them fellowships The fellowships could be given by scientific institutions, Education Ministry and Ministry of Information and Broadcasting. Scientists engaged in active research, can do equally well by considering their important role in increasing science literacy standards of masses as their social responsibility. They can participate equally and of course very effectively (i) with mass media in preparing material on sicence, (ii) by publishing their wiritings of popular nature on the subjects of their interest and (iii) by helping organise scientific exhibitions seminars etc. for the public. The importance of mass media to put the things in right perspective is immense. Newspapers need to evolve policies to give not only enough coverage to scientific events--necessarily not to be of the order of breakthrough in science or sensational science news but even those of general utility. Some leading dailies can very well afford to have a regular feature or column on scientific topics of interest to public In the recent past there has grown an increased interest in popularisation of science. And we can find that today newspapers are giving a little more place to scientific squabbles, though of course not yet satisfactory, seeing the role of science in nation building There are a few popular science magazines in our country which find popularity generally among science students and layman intelligentsia with considerable background in science. The popular science magazines however, separate science from the daily life. I, therefore, believe that mass media has much responsibility in popularising science a daily likewise radio and TV programmes along with current events of all nature, can place science as an event of every day life. Popular science is however needed not only in the under developed and developing countries but also in developed countries which too lack an adequate level of science literacy among masses.

A few scientists who communicate science to laymen are often looked down by their fellow scientists. This attitude is worth condemnation and must change. Instead, all scientists should take part in popularising science. A much closer interaction and cooperation between scientists and science journalists should be soughts. □

Towards Modernisation

Modernisation of Working Women in Developing Societies *by Dr. Raj Mohan Sethi; National Publishing House, New Delhi,* 1976; *Pages* VII 168; *Price Rs.* 35.

COMPARATIVE SOCIAL research on the conditions of women in different countries has been hitherto the specialised field of international agencies because this expensive undertaking is most generally beyond the resources of our domestic institutions Hence, we have so far been on the receiving side and not the givers of homilies to others based on our perception of conditions abroad Besides, we have become more pragmatic rather than politically-oriented in this respect in recent decades

That the author has, for the first time, attempted a systematic analysis of the position of women in two modernizing societies viz India and Turkey is no mean achievement However, the choice of Chandigarh and Ankara, Turkey for the above purpose confines the analysis of the cognitive structure to the urbanised, the educated and employed women of these two cities, the one characterised by its recent emergence as the metropolis of post-partition Punjab and the other of over four decades of established supremacy as the Centre of women's emancipation amongst surrounding Islamic societies The casual circumstances leading to the attitudinal changes towards modernity in the two countries are also historically divergent and diachronic. The exposure to English education of Indian women over its cultural base anchored on Hinduism and Islam and its resultants are of far greater impact elsewhere in India than in Chandigarh, if properly viewed.

A well-written introduction elaborating the basis of modernization and westernization in theoretical terms conducts the reader to the research design that is usually neglected in similar endeavours of doctoral dissertions. The treatment, however, is somewhat over-emphasised as though the aim of the author is to postulate the scientific validity of the conclusions and results of the research project. In regard to the study the primary interest in going through it lies in grasping her nimble and suave handling of statistical methodology with the presentation of the empirical results with more than the usual candour and confidence displayed in similar efforts.

The weakest point in the book is

Books

evidently the large number of generalisations based on inadequate sociological empiricism underlying it, particularly in the author's choice of the indices of modernity and the construction of schedules thereon. Much the same could be stated about the reliance placed on coefficients of correlation based on index items for both Indian and Turkish women in as much as these appear to the present reviewer as being too tenuous to throw light on the settled attitudes and behaviour posited on modernization in depth Let us admit that most of these transcend the criteria of the choice of indices adopted by the author The economic considerations promoting attitudes of a modernity among working women, the environmental impact of the cities on them alongside Western influences of the desirable and undesirable kind etc., also remain to be included in the analysis more thoroughly. These cannot be taken for granted particularly in the Indian situation.

The questionable aspect of the 'systemic approach' about whi[ch] the author speaks of in the soc[io-]psychological context is the mann[er] in which cultural differences ha[ve] been discussed and their axiolo[gi]cal features skeletized for the pu[r]pose of the analysis. In this respe[ct] the author appears to have rath[er] liberally subscribed to the writin[gs] of several scholars abroad who[se] knowledge of the two societies or f[or] that matter, the values implicit [in] traditional society and their cu[l]tures does not appear to be ve[ry] deep. While some of our ow[n] scholars have eagerly supplied t[he] reasoning for lending support [to] the theories of modernization an[d] westernization, these do not eith[er] legitimate them or confer the stam[p] of finality to their erudite view[s].

If we overlook this gullible aspe[ct] that has permeated the choice [of] assumptions and methodology, t[he] present work must be classed [a] pioneer in the field of comparati[ve] social research through a readab[le] book whose anchorage on trad[iti]aional as tending to highlight t[he] aspiration levels based on perceive[d] changes covering a small and i[n]adequate sample, orientations derive[d] from too brief period of stay i[n] Turkey, with markedly less succes[s]ful appreciation of the social re[a]lities implicit in the Turkish la[n]guage and culture, as to enable her t[o] draw tenable comparisons wi[th] Hindu and Sikh women of Chand[i]garh Both are happily tradition[al] and modern in alternating sequenc[e] depending on their economic i[n]dependence or the afluence of the[ir] husbands Let us hope that it is th[e] rediscovery of the modernity [of] abiding traditional values that wi[ll] preoccupy the author in any re[vi]vision of the book that he migh[t] contemplate after deeper and sub[s]tantial study.

The book has been very well pro[]duced, moderately priced and give[s] also a set of useful references, biblio[]graphy and index.

THE MARCH OF MAHARASHTRA

Nehru Birth Anniversary Souvenir, *14th November, 1976; Maharashtra Pradesh Congress Committee, Bombay.*

THE MAHARASHTRA Pradesh Congress Committee has issued, for the first time, this souvenir on the birth anniversary of Jawaharlal Nehru, with the object of presenting various view points on the numerous topics which are of interest to the citizens, particularly of Maharashtra.

People's education in current affairs has indeed assumed greater significance in the context of the national emergency and the subsequent developments These developments together with the world energy crisis and international inflation have brought about a radical change in our political and economic situation And the primary responsibility for people's education lies on the shoulders of the leaders of public opinion, particularly those of the ruling party It is therefore only appropriate that the MPCC should have taken a lead in this direction

Moreover, Maharashtra can legitimately claim credit for many poineering socio-economic reforms The employment guarantee scheme; district level planning, family planning legislation, cotton monopoly purchases, tribal sub-plan are some examples. The Souvenir contains articles on these and similar topics by knowledgeable persons These programmes have significance stretching across the boundaries of the State and outsiders will find this Souvenir an authentic source of relevant information

It would be unfair to apply to a publication of this kind rigorous standards of critical review. However, one still feels that with a little more advance planning the object of the Souvenir could have been achieved in a far greater measure The text of speech of the Chief Minister of the State reproduced in the Souvenir was apparently delivered on an occasion which has very little relevance in this context. There are a few contributions e.g. on world turmoil, role of motivation; etc. which are rather esoteric and might as well have been left out

There should have been also more material to justify the title, "March of Maharashtra". For instance, the article on Maharashtra's agriculture is a good analysis of the past experience and the future prospects in this field. But one searches in vain for similar treatment of other sectors, particularly industry. Maharashtra enjoys a popular image of a highly advanced State. But if the industrial concentration in the Bombay-Poona-Nasik triangle is left out the State is as backward as any other State in the country. The State is predominantly agricultural and the great amount of uncertainty associated with this major occupation makes the life of the people in the State extremely vulnerable Only about 10 per cent of the area of the State is under irrigation as against 75 per cent in Punjab, 45 per cent in Tamil Nadu and Haryana and 23 per cent in the country as a whole. Only another 10 per cent has an assured adequate rainfall and another 40 per cent has assured but comparatively less rainfall. The remaining 40 per cent has very scanty rainfall. This extreme dependence on rain explains the great fluctuation in agricultural output and subsequently the economic fortunes of the people of the State. Thus foodgrains production in Maharashtra was more than 77 lakh tonnes in 1961. It dipped as low as 30 lakh tonnes in 1972-73 and attained the peak of 91 lakh tonnes in 1975-76. The March of Maharashtra is thus not all that straight and steady.

The Souvenir could have brought out the real challenges and opportunities in sharper focus Even so, it does serve to reassure the readers that the State is on the right path and given determination on the part of the administration and people's cooperation, it is possible to achieve significant results for the amelioration of the lot of the poor and the underprivileged

—M.R. Kulkarni

Integrated Rural Development

Contd from Page 14

sometime before this new venture yields concrete results and on a sufficiently national scale. Meanwhile, as the Prime Minister has pointed out in the case of gobar gas plants, the remedy may prove worse than the disease by depriving the poor of their inexpensive asset without giving them a reasonable share in the energy and fertiliser products of such plants. I am all for using science and technology for dealing with rural development and solving the problem of rural poverty But it should not be treated as a substitute for not dealing with the basic problems of the viability of the village unit, the more equitable distribution of productive assets among rural households, the greater access on the part of the poor to the inputs and other facilities afforded by government for their benefit, the democratisation of the rural power structure, and the creation of the necessary consciousness and organisation among the rural poor for ensuring their effective participation in, and influencing of the rural developmental process □

Cooperation in Bio-Gas Technology

Contd. from Page 27.

for integrated bio-gas projects for the type in use in the Pacific countries like Philippines. In no other field there is greater need for exchange of ideas and information than in this.

Bio-gas programme is poised for a big leap. International co-operation will definitely help to give it a boost. Technologists are now busy working on designs suitable for different climatic regions. This must be so in other countries also. Dr. S.R. Barooh, the Fertiliser Commissioner, however, feels that there is scope for setting up 6 million plants at the rate of 10 plants in each of the six lakh villages. Judged by the results and the potential in terms of 220 million tonnes of cattle dung during a year, which is currently used as fuel, it should be conceded that the pitch of the effort has not been high enough. The main drawback is the absence of a clear-cut focus in the policy on bio-gas plants. □

Development Notes

Irrigation Scheme in Raisen District

The State Agriculture Department has finalised a Rs 7 million scheme with the assistance of the Agriculture Refinance Corporation for developing irrigation facilities in 475 villages of the Raisen and Gairatganj tehsils in the Raisen district of Madhya Pradesh The scheme when completed would provide irrigation to an additional 1 9 lakh hectares of land

The scheme includes construction of 400 new wells, installation of 700 electric and 200 diesel pumpsets and repair of 600 wells

A similar scheme was launched last year in the Gairatganj, Begumganj and Silwani tehsils of the district with a total provision of Rs 11 1 million to provide irrigation to an additional area of 1 39 lakh hectares.

Central Board for Malaria Control

A high-powered Board, with the Union Health Secretary as Chairman, has been set up to ensure the speedy and effective implementation of malaria control programme, particularly the revised strategy

The Board will look after procurement, supplies and evaluation, review and coordinate research and training activities, exercise all financial powers and set as a clearing house for projects in the field of malaria control All experimental and innovative schemes likely to help fight malaria and costing more than Rs. 5 lakh are to be referred to the Board for scrutiny and approval. Schemes costing less than R 5 lakh may, however, be sanctioned by the Secretary

With the setting up of the Board and the adoption of the modified plan of operation, the anti-malaria drive gets a new result-oriented thrust, whereby Central assistance to the States will be linked to the performance of the States concerned

State Governments have been asked to make arrangements for the proper enforcement of the new plan, which will be assessed by independent appraisal teams.

Gobar Gas at Reduced Cost

A significant breakthrough in cost reduction of constructing a Gobar gas plant has been achieved, by the M P Agro-Industries Corporation The Corporation has succeeded in designing a cheaper gas collector Made of cinder and cement, this collector has the same weight as the steel drum and costs only Rs 250 for a 100 cft unit The steel gas collector costs Rs. 1,200 Besides, the new collector can be manufactured at the site of the installation by a semi-skilled village mason, obviating cumbersome transportation and bottlenecks in its manufacture on a large scale It also obviates the need for any special water tank for curing as the water will be filled in the upturn cement and cinder container itself.

A proto-type improved Gobar gas plant has been functioning successfully at Tikamgarh in Madhya Pradesh for sometime The Agro-Industries Corporation which has so far installed over thousand Gobar gas plants in last one year, is set to construct 15,000 more units in the State by the end of 1978

Electronic Calculators by Small Units

About 50 per cent of the total capacity of 1,83,000 created in the country for the production of electronic calculators has been assigned to the small-scale sector. More than 65 per cent of the capacity in the small-scale sector has gone into production and other units are at various stages of implementation

The production of electronic calculators in the small-scale sector which started with 6,000 nos in 1971, made remarkable progress during 1975, contributing about 55 per cent of the total production of electronic calculators in the country during that year The production envisaged during 1975 would be more than double of last year's production. These units are producing a wide range of calculators with and without memories, pocket calculators, etc.

Rise in Hosiery Exports

The woollen hosiery industry in India exported goods of a total value of Rs 231 2 million in 1975-76, as compared to only Rs 1 2 million in 1961-62. If the present rate is maintained, the industry's export value would touch Rs 500 million by 1980-81

India's total wool and woollen exports today account for some two per cent of the total national exports annually Out of the total wool exports, the hosiery exports account for a little less than one-third In Punjab, almost 70 per cent of the hosiery industry is engaged in export production and it accounts for nearly 40 per cent of the exports from this State. The investment-export value ratio of approximately 1 7 shows the personal contribution and hard work of the entrepreneurs

Bulk of our hosiery exports go to the East European countries pre-dominantly the U S S R and Czechoslovakia. Recently our hosiery goods have also found entry into the Middle East and Gulf countries, African countries and also to the U.S.A. and West Europe.

Gauhati Refinery Capacity Being Increased

The refining capacity of the Gauhati Refinery is being increased from the present design capacity of 0 75 million tonnes to 1 million tonnes per annum in the near future An additional investment of Rs. 4 to 5 crores would be necessary for this From a design capacity of 0 75 tonnes per annum, the throughput had steadily increased to 0.827 million tonnes last year and this year the target was set at 0 84 million tonnes According to indications, the target was being achieved by way of better capacity utilization.

Crude distillation unit processed all time record throughput of 0.827 million tonnes and the kerosene unit also achieved an all-time record throughput of 1,26,630 tonnes during the year The coking unit operated for 330½ days during the year which was the maximum number of operating days since commissioning of the refinery. It processed 3,41,352 tonnes of reduced crude The production and distribution of liquefied petroleum gas (Indane) were 3,102 and 3,031 tonnes, respectively, which was also an all-time record the refinery achieved so far.

Work on Mirzapur Thermal Power Station Begins

Work has started on the construction of India's first 2,000-mw capacity super-thermal power-station in a remote area of the vast Mirzapur district of Uttar Pradesh

The plant will be very close to the Jayant mines of the Singrauli collieries now under construction in M P three kilometres from the UP border. The new mine will meet the entire fuel requirements of the powerhouse A central sector project, the plant will be installed and operated by the National Thermal Power Corporation for supplying power to the proposed national grid connecting all states The Corporation has yet to take charge of the site. In the meantime, preliminary work under way at the site is being supervised by the electricity and irrigation departments of the UP Government.

Central Aid to States for Irrigation

The Centre has agreed to give the States Rs. 48.10 crore as advance Plan assistance in 1976-77 for accelerating work on major and 16 medium irrigation projects in 14 States during the current annual Plan period During 1976-77, an outlay of Rs. 606 crores was originally agreed to by the State governments in their Annual Plans for irrigation work purposes. As a result of a review conducted recently, an additional outlay of Rs 75 20 crores has been suggested by the Planning Commission for speeding up work on 40 projects during the year. While the Centre has agreed to give Rs 48 10 crores, as advance Plan assistance, the concerned State governments have been asked to meet the remaining Rs 27.10 crores from their own resources.

Under the 20 point programme, an additional irrigation of 5 million hectares is to be created in the last four years of the Fifth Plan period from the major and medium irrigation projects.

Upper Wainganga Project

Work is in full swing on the Rs 370 million upper Wainganga project in the Seoni district of Madhya Pradesh which, when completed, will irrigate more than 113,000 hectares of land – about 66,000 hectares in the Seoni district and about 35,000 hectares in the Balaghat district. Excavation for the main dam and three main canals has already started.

The construction of 21 km. approach road and 140 buildings at the construction site to house the offices and staff has already been completed and work was in progress to complete Chhapara and Samnapur residential colonies near the main dam.

It may be mentioned that a reduction of Rupees 70 million in the cost of this dam had been effected and its capacity for irrigation increased by 40,000 hectares by changing the site to higher level and by raising the height of the dam by ten feet.

The area brought under irrigation as a result of this project will yield an additional production of 1.67 lakh tonnes of foodgrains, 1,960 tonnes of sugarcane and 1 86 lakh tonnes of good quality fodder besides providing a large water- spread for pisciculture.

Conversion of Rust into Protective Coating

The Central Electrochemical Research Institute (CECRI), Karaikudi, has developed a coating composition which converts the rust formed on mild steel surface into a black, hard protective coating. The surface so converted acts as a good base for applying paints and helps increase paint life.

At present, such a protective measure is not adopted in the country but if the CECRI process is widely adopted in the country, a demand of the order of 200 tonnes per annum for the rust converting composition is likely to be generated. All the raw materials required for the preparation of the rust converter are indigenously available

New Zinc Units to be Commissioned Soon

The expansion of the Zinc Smelter Project at Debari near Udaipur will be commissioned soon. The roaster a key plant has already been fired and the feeding of concentrates is likely to commence shortly When the expanded smelter goes into production the capacity of the Debari Unit of Hindustan Zinc Limited will be more than doubled from 18,000 tonnes to 45,000 tonnes of zinc metal per annum.

The Visakhapatnam Zinc Smelter Project, with an installed capacity of 30,000 tonnes is also expected to be commissioned in the first quarter of this year These two plants together will add 57,000 tonnes to the total capacity of zinc production of the Hindustan Zinc Limited

EPI Commissions Its First Furnace

Engineering Projects (India) Limited completed its first furnace project on January 3, 1977 with the supply, erection and commissioning of three furnaces for the manufacture of gas cylinders at Bharat Pumps and Compressors Ltd , Naini, Allahabad

EPI has entered into a long term collaboration agreement with DEMAG AG of West Germany to manufacture electric arc furnaces for steel making of capacities ranging from 30 to 300 tonnes and electric reduction furnaces for the manufacture of pig iron, ferro alloys, calcium carbide, non-ferrous metals etc. of capacities from 6 to 100 MVA

A similar long term technical collaboration agreement exists with STEIN SURFACE of France for reheating, heat treatment and special purpose furnaces for both ferrous and non-ferrous metals of capacity above 25 tonnes per hour. EPI has 5 contracts in hand for furnaces of all these types of total value of Rs 120 6 million.

Trombay V Expansion Project

An agreement has been reached between the Fertilizer Corporation of India and Snamprogetti S.p.A. of Italy covering engineering, supply of imported equipment and technical supervisory services for the construction of a 900-tonne per day Ammonia Plant and 1000 tonnes per day Urea Plant at Trombay. The Project, known as Trombay V, is a major expansion of the existing Trombay fertilizer factory complex near Bombay.

While the major portion of the ammonia produced will be utilized for manufacturing Urea in the new plant, a part of it will be used by some of the existing plants at Trombay and by the plants already under construction under Trombay IV Expansion Project.

Trombay V will use naphtha as feedstock in the initial stages and changeover to associated gas when it is available from the Bombay High operations.

While Snamprogetti will provide the basic engineering and technical supervision to the extent required, detailed engineering, project management and construction and other similar activities will be handled by FCI's Planning & Development Division and Trombay's Project Division.

Sunflower — A New Crop For Punjab

The sunflower crop has recently been introduced in the Punjab The best time for sowing this crop in Punjab is from the last week of January to the middle of February At this time it can be successfully grown in the lands vacated by potato, toria and cotton crops It gives an average yield of 5 to 6 quintals per acre.

Earlier the farmers experienced some difficulty in selling the produce Now Hindustan Levers Limited, Bombay in collaboration with the Punjab Agricultural University, Ludhiana have offered a guarantee price of 90 per cent of the groundnut rate prevailing in the market at the time of sale in May and June 1977 The sunflower growers are advised to enter into contract with the Firm by signing the specific form which is available with the Department of Plant Breeding, of the Punjab Agricultural University, Ludhiana This way they can ensure the sale of their sunflower crop

Electronic Regulator for Ceiling Fans

A small sector unit in Delhi has developed an improved electronic regulator for ceiling fans. It incorporates a solid state system which is smaller and lighter than the conventional regulator Because of the all solid-state design, the life of this regulator is semi-infinite Since no power is dissipated in the regulator itself, the regulator operates at room temperature resulting in further enhancement of its own life and the life of the bakelite board on which it is mounted.

The electronic sub-assembly inside the fan regulator is on a paper PC board The entire system is housed in an elegant high-impact polystrene cabin The most significant feature of this item is the considerable overall saving of power It has been computed that, for a 100 watt fan, the total saving per season would be Rs 20 when the tariff is 25 Paise per unit The regulator is currently priced at Rs 55 plus local taxes

Vegetable Oils and Waxes from Indian Plants

Most of India's diverse plant resources go waste but recently some National Laboratories of the Council of Scientific & Industrial Research have developed processes to obtain vegetable oils and waxes from them The Regional Research Laboratory, Hyderabad has carried out expensive studies on processing of cottonseed to obtain oils and other chemicals The work has been done on pilot plant scale of 20 tonnes per day. The laboratory has also developed process for preparation of chemical cotton from cotton linters and production of cottonseed flour from cottonseed cake

In another experiment, the Hyderabad Laboratory, has developed a process for obtaining hydrogenated castor oil from castor seeds The product obtained compares well with the imported product.

The Hyderabad Laboratory has also developed an improved process for the manufacture of dehydrated castor oil for making white and pale coloured paints and enamels, particularly suited for refrigerators

In another experiment, the N.C.L has developed a process for improving the quality of gum ghatti, a natural product of Indian origin which is exported in a substantial amount.

The N.C.L has also found that wax and alcohols can be obtained from sugarcane press mud A suitable pilot plant for the extraction of waxes from the sugarcane press mud has been assembled.

EDITORIAL

Our Economic Performance

The din and dust that accompanies electioneering campaigns on the eve of poll is a periodical phenomenon in an open society. That ours is one such, nobody has doubted The passions and slogans raised on the occasion, though inevitable, do not provide a congenial atmosphere for an objective assessment of economic performance in the period preceding the poll. Even so, a mature electrorate are most unlikely to miss the point that whatever be the outcome of the contest, the last two years have been among the best that free India has seen.

1976 saw the injection of dynamism into India's economy, particularly in areas where it has felt the pinch for far too long—agriculture, industrial production and export performance. There has been a qualitative change in the economic outlook as a result, partly due to satisfactory rains but largely due to a determined effort on the part of the farmers, workers and management to infuse hard work and a degree of realism and self-control in the process of production. An excellent Kharif crop in 1975 followed by satisfactory harvests in 1976 have resulted in the storage of over 17 million tonnes of foodgrains for public distribution, providing a reliable cushion against a possibility of partial drought in the coming season This has largely contributed to the arrest of price inflation and the people have developed confidence in the public distribution system. Fertilizer production has risen and so has consumption with a reduction in its cost to the farmer The area under major and minor irrigation has increased by over 5 5 million hectares which in itself is no mean achievement The year also saw the birth of a new programme integrated rural development based on a detailed survey of local needs, resources and potentialities. Besides, special programmes for hill and tribal areas, backward classes and small farmers continue to make good progress There is clear evidence of acceleration in the rate of agricultural growth.

A noteworthy feature of the last two years in the economic history of India has been the spurt in industrial growth, with about 11 per cent during January-October 1976. Together with the performance in the small scale sector, the progress would be much higher. The Public Sector which had been the butt-end of criticism and ridicule showed the highest growth rate with 12 per cent Power generation, steel, cement, aluminium, fertilizers, Vanaspati, newsprint, baby food, agricultural machinery and commercial vehicles and diesel engines can be picked up as random examples of the spurt in growth rate. Consumer durables have also done very well and the general climate for industrial growth has never been so favourable as it is now. All this would not have been possible without the pragmatic policies adopted by the Union Government Between January-November alone power generation rose by an impressive 17 per cent

Besides, as a result of various administrative measures taken in 1975 and 1976, tax collections and savings have improved and circulation of black money has been vastly reduced.

In spite of the rising trends in prices of consumer articles in recent weeks, the price level of most of the commodities stands below the 1974 line Part of this rise is attributable to speculative tendencies in select consumer commodities like edible oils. Perhaps the most outstanding performance has been in the field of foreign trade. Our balance of payments position has never been so good as it is now, with reserves totalling about Rs. 22,460 million as on December 17, 1976.

The overall picture of satisfactory performance in the economy must be matched with Government efforts to improve the lot of the most deprived sections of our society—the scheduled castes and tribes and slum dwellers. There has been peace in the schools and colleges. Our cities are a bit cleaner and thousands of families have been given farm-land and building sites.

The Economy and the Plan

SANKAR GHOSE

Minister of State for Planning

THERE WAS a distinct and significant improvement in the economic situation in 1975-76 on account of the various measures taken in the wake of the emergency and the launching of the Twenty-Point Programme of the Prime Minister and the increase in agricultural and industrial production Though there has been some pressure on prices during the current year, yet considering the various economic indicators the overall economic situation is encouraging

Even though the weather conditions during this year have not been as favourable as in the last year, the kharif output would be around or only marginally lower than that of last year The prospects of rabi crop are bright Both as a result of the downward revisions in the prices of fertilizers and the measures taken to promote their use, the consumption of chemical fertilizers has picked up The fertilizer offtake in the kharif season increased by about 32 per cent The production of oilseeds and cotton during the current year may be somewhat lower than last year's level, but the production of sugarcane is likely to be higher and that of jute and mesta significantly higher With large stocks of foodgrains of around 17 million tonnes with the public agencies this can be viewed with some satisfaction

The growth in industrial production during the first six months of the current year April-September 1976 at 12.5 per cent compares favourably with the growth of a mere 3 per cent during the corresponding period of the previous year On present indications the industrial output on the whole may be higher by 9 to 10 per cent during 1976-77 than in the previous year The data relating to the output of selected industries for the first 4 months of 1976-77 indicates that sizeable increases in output occurred during this period in industries relating to nitrogenous and phosphatic fertilizers, cement, scooters, paper and paper board, newsprint, aluminium, industrial machinery, caustic soda, etc. Even a number of industries, specially cotton yarn and cotton cloth and passenger cars, which were subject to recessionary conditions in 1975 recorded significantly higher

As a result of planned development and various policy measures taken in the last two years, the Indian economy is now in a stronger position than ever before. There is today greater economic discipline and a new dynamism. A favourable climate has thus been created for resuming the process of planned growth with greater vigour and confidence

levels of output during this period The performance of public sector enterprises has also continued to be satisfactory.

The improvement in industrial production has been on account of a variety of factors On the whole, the power supply position has been better and the availability of strategic inputs like steel, coal, cement has been easier There has been a signifiacnt improvement in the industrial climate The man-days lost during January-June 1976 of 6 03 million was considerably lower than 17 10 million man-days lost in the corresponding period last year

The balance of payment position during the current year has been promising Exports during the first seven months at Rs. 2750 crores have been higher by about 33% than in the corresponding period last year. Imports on the other hand have been lower by about 10 per cent to Rs 2675 crores. There was thus a trade surplus of Rs. 75 crores against a large deficit of about Rs 916 crores in the same period in 1975-76 The foreign exchange reserves have shown a further improvement and reached the level of Rs. 2450 crores by the end of November 1976 as against Rs. 1885 crores at the end of March, 1976.

Price Line

The index of wholesale prices which rose from 283 at the end of March 1976 to 315.7 in the middle of September 1976 stood at 313.5 on November 27, 1976. The rise in prices has, however, been more of a sectional character Nearly three-fourths of the increase in prices has been on account of three major commodity groups, namely, edible oils and oilseeds, cotton and sugar and allied products. In fact, half of the rise is explained by the rise in the prices of edible oils and oilseeds The prices of certain other commodities like rice jowar and potatoes also came under pressure mainly on account of seasonal factors but of late the prices of commodities like gur, sugar, jowar and potatoes declined and those of rice and pulses showed a steady trend. On the other hand, the wholesale indices of chemicals as also machinery and transport equipment have registered a decline, the wholesale indices in their case being lower by 7% and 1.7% respectively over the end of March 1976. The index of manufactures rose by 5.1% since the end of March 1976 but here again a significant part of the increase had been on account of the increase in the prices of cotton yarn and mill cloth

In order to contain the rise in prices, various measures have been taken in the last few months which have included arrangements for imports of essential commodities like edible oils, raw cotton, tightening of credit against sensitive commodities like oilseeds, edible oils and raw cotton, larger releases of sugar and anti-hoarding operations The supplies of foodgrains through the public distribution system are also being stepped up

Recently a national policy for edible oils and fats has been evolved which, besides stipulating for the removal of formal and informal restrictions on inter-State movement of edible oils, includes extension of price support to groundnut and sunflower seeds, arrangement of adequate imports of edible oils and continuation of restriction on the use of groundnut oil by the vanspati manufacturers In view of the overall shortage of cotton and in order to reduce the pressure on their prices, recently the Government extended the period of free licensing of imports of viscse and polycosic staple fibres and exempted them from the levy of customs duty. The import of polyester fibre has been decanalised and placed on free licensing. Adequate arrangements are also being made for the import of sizeable quantities of cotton. The Government is keeping a vigilant watch on the movement of prices, particularly of essential commodities, and is determined to take all such corrective action as become necessary from time to time.

There has, however, been a faster growth in money supply. This has increased by 10.9% during the current year till November 19, 1976 as compared to an increase of 5.3% in the corresponding period of the previous year. Besides a much larger accretion to foreign exchange assets of the banking sector (Rs. 717 crores), a major factor responsible for the larger increase in the money supply during the current year has been a substantial increase in the bank credit to the commercial sector, namely, an increase of Rs 1421 crores against an increase of Rs. 861 crores in the previous year Even though a large proportion of the increase in the bank credit to the commercial sector was on account of food procurement credit (Rs 637 crores), yet the increase in non-food credit to the commercial sector has also been larger However, in order to keep the expansion of money supply within reasonable limits the Reserve Bank is following a policy of credit restraint and has recently further raised the ratio of cash reserves for the banks and has stressed on the commercial banks the need for the adoption of a stringent credit policy vis-a-vis the commercial sector

The Annual Plan 1976-77 of Rs 7852 crores envisages a sizeable step up in public investment, the total outlay being higher by 31.4% than the original outlay of Rs. 5978 crores for 1975-76

In the Fifth Plan, the public sector outlay has been stepped up from Rs 37,500 crores in the draft plan to about Rs. 42,303 crores inclusive of inventories This is more than two and a half times the outlay of Rs. 16,774 crores that was provided for the public sector in the Fourth Plan.

Irrigation

The outlay on irrigation and flood control has been raised from Rs 2681.00 crores in the draft plan to Rs 3440.18 crores in the final Plan, the investment in power has been raised from Rs. 6190 00 crores to Rs 7293.90 crores and in industry and mining from Rs. 9029 00 crores to Rs 10200 60 crores. Though the revised provision in the Fifth Plan for education and social services is lower, the outlays for the last two years of the Plan in these sectors are higher than those for the first three years.

We have to take all steps to ensure that the economy grows at the rate of at least 5.2 per cent per annum in the last three years of the Fifth Plan. And in order to achieve the physical targets of the Fifth Plan steps have to be taken the ensure that food production goes up from 104.7 million tonnes in 1973-74 to 132 million tonnes, or at least to 125 million tonnes, in the terminal year of the Plan, oilseeds from 8.7 million tonnes to 12 7 million tonnes, nitrogenous fertilizers from 1.06 million tonnes to 2 7 million tonnes, cement from 14 67 million tonnes to 20 8 million tonnes and finished steel from 4 87 million tonnes to 8 80 million tonnes

The target of production of crude oil has been raised from 12 million tonnes as envisaged in the draft Fifth Plan to 14.18 million tonnes by 1978-79 in the Final Plan In the energy sector, production of coal has to go up from 79 million tonnes in 1973-74 to 124 million tonnes in 1978-79 Power generation has also to go up in order to meet the anticipated demand of power of about 70 billion kwh by 1978-79

The finalization of the Fifth Plan proves beyond all shadows of doubt that the economy has turned the corner We have succeeded in insulating our economy from the runaway inflation, and we can now forge ahead with our planned developmental programmes with greater vigour

Plan Strategy

Our plan strategy is based on the diode of development and social justice. We have to ensure that benefits of development percolate to the grass-roots. One of the most efficient means of doing so is to generate employment But employment cannot be generated by a mere increase in public expenditure in the less productive traditional sectors. The rural youth has to be so employed that they contribute substantially to the augmentation of the net national product. We are accordingly going in for the improvement of irrigational facilities and the modernization of livestock breeding, poultry farming, pisciculture, rural handicrafts and allied activities The nationalization of the land-tenure system and the distribution of land among the land-less are also necessary for the creation of more employment opportunities for the rural poor. In order to increase employment and output, the Fifth Plan lays considerable emphasis on programmes for the small farmers, agricultural labourers, and the urban unemployed

Planning has by now become a way of life for our nation. In fact, our strategy of planning is basically Indian and is not based on any foreign model. Though we have to learn from the experience in planning of other countries, we can pursue only our own model of planned development. A Plan that is modelled upon foreign experience alone is like an exotic plant that cannot strike roots in the country. Our plans have to be based on the needs and aspirations of the people and have to be suited to our conditions and experience

In choosing the path of planning we opted out of laissez faire We did so not because of any doctrinaire obsession but because of our determination to eliminate the anomalies and anarchy of uncontrolled economic forces leading to poverty and inequality

Though we have not chosen the path of laissez faire, we have also not chosen the path of regimentation Our planning is not totalitarian. It does not prevent the development of the initiative of the people Our planning is democratic and people-oriented.

Participation of the entire nation in the formulation and the implementation of plans is the alpha and omega of planning People's involvement is not an exogenous attribute to the process of planning; it is an essential corollary of the social philosophy underlying planning.

Planning does not consist merely of a set of techniques. In fact, the input-output matrices or the equations of programming or any other sophisticated tool used by the planners are only some formal and computable methods of expressing the aspirations of the nation. The success of the plan depends not on these forms, but on their real content. The correspondence of a plan to the historical and economic realities of the nation gives it its real content

A plan is not merely an economic document It alters radically our social and cultural life A rational reorganization of the economy necessitates major changes in habits, values and attitudes Hard work, discipline, dedication to national as distinct from sectional causes and a spirit of justice are essential for the successful implementation of a plan. The entire nation has to strive for the creation of these habits, attitudes and values It is only an attitudinal revolution that can nave the way for effecting an economic transformation. A new kingdom of the mind is the only guarantee for the creation of a new, better and a more scientifically planned economy.

The Proposed Age at Marriage

ASOK MITRA

THE NATIONAL Population Policy stated by the Union Minister of Health and Family Planning in Parliament on 16 April last is a document of sagacity, statesmanship and integrated vision. It would however be a pity to pigeonhole it with expressions of praise and approval. The best tribute to it would be to discuss it constantly and thereby keep its many messages alive in the public mind. There are so many aspects to the Policy Declaration that a discussion on more than one of them at a time would demand in ordinate space and time. We have therefore chosen only one aspect for discussion and this is the one with which the operative part of the Policy Declaration opens: age at marriage

For India as a whole the mean age at marriage for females increased from 16 1 to 17.2 (rural 15.7 to 16.7) and for males from 21 4 to 22.2 years (rural 20.8 to 21.6) between 1961- and 1971. But the Report on the First All India Survey of Family Planning Practices in India conducted by the Operations Research Group of Baroda in 1970-71 gave the estimated mean age at marriage as 23.8 years for males and 18 3 years for females for the period of marriages 1966-70.

The Union Minister of Health and Family Planning, in the National Population Policy Statement in Parliament on 16 April 1976, stated: "It has, therefore, been decided that the minimum age of marriage should be raised to 18 for girls and 21 for boys, and suitable legislation to this effect will be passed."

While this announcement must be enthusiastically welcomed, particularly in the context of the Minister's opening statement in this regard that—"Raising the age of marriage will not only have a demonstrable demographic impact, but will also lead to more responsible parenthood and help to safeguard the health of the mother and the child," —the proposed legislation will largely have the effect of blessing a state of affairs already attained and not of ushering in a fresh aspiration in the life of the people. For one thing, taking the past trend in its stride, the mean age at marriage for females may already have moved into 18 and that of males to about 23 by 1976, if one takes into account the upward trend in educational enrolment and the intensification of the struggle for employment since 1971. Secondly, although the mean age at marriage means that a substantial proportion of the population is still below that figure, it also means that a very substantial proportion of the population is already above the mean, for whom the new legislation will carry no forward-looking message, on the contrary plenty to feel smug and even conservative about. For already in 1971 even in the rural areas of all states and union territories except Madhya Pradesh, Rajasthan, Bihar and Orissa, the mean age of marriage of females had substantially exceeded 18. This mean age had been exceeded as long ago as 1971 even in the rural areas of Punjab, Assam, Kerala, Tamil Nadu, Manipur, Tripura, Goa, Daman & Diu. By and large therefore, the country is generally poised in 1976, even without legislation, for exceeding 18 as the mean age ta marriage for females. So far as males are concerned the minimum of 21 in the proposed legislation had already been exceeded as far back as 1971 not only in the urban areas of all States and union territories (except Rajasthan), but even in the rural areas of all states and union territories except Rajasthan, Uttar Pradesh, Madhya Pradesh and Bihar The average difference between male and female ages at marriage is about 5 years at present suggesting that the mean age at marriage for males may well be pegged above 23 For males, therefore, the proposed legislation looks backward even on the current situation, instead of looking forward to establish new norms and aspirations in the mind of the people.

As has been acknowledged generally not only by scholars but by discerning persons of wide general experience, the age at marriage which will really mean a difference t[o] lity and the health of the mo[ther] one that is above 20, more pr[...] above 22, and not 18. First, we must mention [...] cation. Raised marriage age [...] essentially demand that scho[...] formal education for girls is a [...]

Shri Mitra is Professor, Centre for Regional Development, Jawaharlal Nehru University and Director, ICSSR & FPF Projects.

to be followed either by higher or vocational education. Otherwise it will be difficult to keep girls usefully occupied or to prepare them for their future. A raised minimum marriage age without education will be so much national waste by way of denial of household or economic enterprise to a young woman. Secondly, education for grown-up girls will demand a revolution in social attitude and behaviour. Unmarried girls will have to be respected as full and estimable citizens, which is still far from being the case Third, more and more useful employment outside of home as well as within will have to be generated to harness the full potential of this enormous human resource. Fourth, attitudes towards employment outside of home even after marriage will have to be modified which too would mean a great augmentation of the appropriate use of this human resource This in its turn will exert its wholesome pressure in favour of equal pay for equal work for men and women. Fifthly, strongly entrenched attitudes toward the code of conduct and ethics so long unilaterally imposed upon young unmarried women will have to change very rapidly, particularly with respect to the right of personal association. Sixthly, attitudes towards marriage as an irreversible sacrament, toward divorce, separation and single living will have to be modified including attitudes toward motherhood out of wedlock, for surely, the number of women would grow who would like to experience the joys and responsibilities of motherhood without being compelled automatically to accept the constraints of wifehood. Seventhly, since raised age at marriage is bound to give a great fillip to the small family norm, serious thought will have to be given to the employment of women, after they have stopped child bearing and rearing their young through the age of six. This will mean an extension and suitable employment programme for women aged 28 or 30 onwards. Lying-in facilities at rural health centres will have to be improved beyond recognition to cater to first and subsequent confinements at higher ages. This will also demand other public health, social and economic policies that will improve the survival of children. In the next place, higher ages at marriage, particularly for women, will vastly augjment the ranks of family planning acceptors Thus raising the minimum age of marriage for women ought to prove one of the greatest and more effective agents of social, economic and cultural change in our country.

The function of a legislation is not only to confirm a social trend but to take it forward to what in the available state of the art is a new realisable goal, which will facilitate further

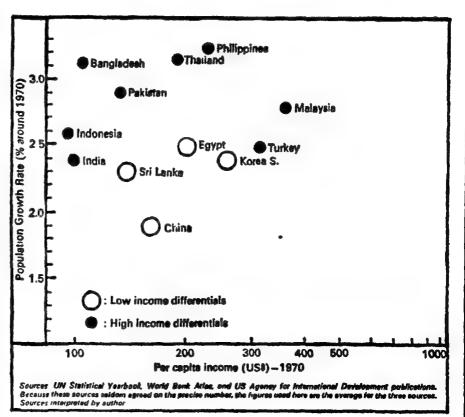
Contd on page 10

Population and equality

An analysis of population growth rates has been made by the Rural Development Committee at Cornell University in a study of local organizational systems and rural development performance It included countries ranging from China and Japan in the Far East to Turkey and Egypt in the Near East.

The comparisons, shown in the accompanying graph, took into account differences in the level of per capita income. As it turned out, those countries which had the more extensive and effective organizational systems reaching down to the local level—and definitively more impressive performance in terms of agricultural productivity and provision of welfare—were also countries with the more equitable distribution of income. This was due in large part to land reform but also to policies giving more equal access to public services and using labour more fully in production processes.

Sources UN Statistical Yearbook, World Bank Atlas, and US Agency for International Development publications. Because these sources seldom agreed on the precise number, the figures used here are the average for the three sources. Sources interpreted by author

Further, these countries showed lower rates of population growth. As seen from the graph, at any given income level, the more organized and equitable cases are all in the lower population growth rate brackets.


Horticulture In NE Region

A. V. BHULESHKAR

ALTHOUGH CLIMATICALLY the North-Eastern region has been well-endowed for the development of horticulture, plantation and forestry, not much has been done so far to exploit the available natural resources for the scientific promotion on these types of cultivation in this region The main constraints for its non-development can be attributed to insufficient infrastructure facilities, paucity of finance and lack of technical expertise to guide the systematic growth required to make a breakthrough on a formidable scale. The responsibility for not attending to the problems of such type of industries also rests with the officials of this region who have not shown much interest in the past to familiarise themselves with the local resources and conditions or made much effort to avail the institutional finance, from the various agencies to bring about longterm sustained growth

The pre-investment survey conducted on these aspects in the North-Eastern region, comprising the seven states of Arunachal Pradesh, Meghalaya, Mizoram, Nagaland, Assam, Manipur and Tripura by the Agricultural Refinance Corporation, a subsidiary of the Reserve Bank of India, has brought to the fore, the vast scope and potentialities that exist in the development of these types of activities in this region It is gratifying to state that the response of different state authorities to undertake cultivation of horticultural crops, plantations and afforestation on scientific lines is encouraging which will enable the flow of institutional finance for the development of such categories of industries in future

In his foreword to the Report on the "Pre-Investment Survey of North Eastern Region for Development of Horticultural crops Plantations and Forests," Shri M.A. Chidambaram, Managing Director of Agricultural Refinance & Development Corporation has pertinently pointed out that "The problem of horticultural development is different and more difficult in view of the highly competitive market for the processed fruit products both within the country and outside. For this reason no scheme for the development of horticultural crops can succeed without a complimentary scheme for the processing of the fruits which in turn would succeed only if the market link is effectively forged"

The study team's main recommendation is to set-up as a joint sector a "Horticulture and Development and Processing Company" having equity participation from Central Government, State Government and one Private Party which should shoulder the management responsibility, and this has been envisaged to make arrangements for ensuring quality production and competitive marketing both in India and abroad This proposal can, indeed, be true for many agricultural commodities in view of perishable nature of the produce Thus, the company should be organised on the basis of vertical integration of production, processing and marketing with the established manufacturers of processed foods and this point has been rightly emphasised in the report as many instances of such a type of vertical integration are found in many agricultural commodities in Britain and Western European countries The areas where initially modern processing units could be started are: Silchar or Lakhimpur in Assam; Jiriban in Manipur; Kumarghat in Tripura, and Damadubi in Meghalaya. Since there is ample scope for development of horticultural crops such as pineapple, orange, lemon and banana in this entire region, the study team has felt that a well-knit arrangement could be worked out with the proposed company and the State Horticultural Departments in the respective states for improved cultivation of pineapple and other fruits

With regard to plantation crops, a special revolving fund has been suggested to be set-up in the ARC with an initial contribution of Rs 150 million from the Central Government to assist especially medium and sick tea estates, as this would rehabilitate them from the bank finance made available from this proposed fund

Development of rubber and coffee plantations can be promoted by th establishment of public sector undei takings by State government About 66,000 hectares can be culti vated in Assam, Tripura and Megha laya initially. Similarly, essentia oil bearing crops such as citrone and pepper-vine can be cultivate in about 7,000 hectares, at the rat of 1,000 hectares in each of the seve states in this region, through publi sector undertakings to be establish ed for development of plantatio crops As regards forest develop ment it has been suggested immediat steps should be undertaken fo formulating schemes for plantation of forest trees such as pine in Megha laya, Cinnamon in Manipur an Holling ir Assam. For the imple mentation of these schemes adequat finance should be made availabl through public sector undertaking t be set-up by the respective state go vernments

India produces some 22 millio tonnes of fruits and vegetables an it was estimated that by the end c the Fourth Plan the production wi go to 32 million tonnes It has bee reckoned that nearly 25 to 30 pe cent of these perishables are waste in marketing operations starting fro picking to the final marketing stag Presently, only one per cent of th total production is used for process ing purposes If the wastage is mini mised and more is utilised for pro cessing, there can be enough nutr tious feed for internal consumptio and for export.

It may be mentioned that the 1. oz. per capita intake of fruit i India is the lowest in the world. I has been estimated by the India Institute of Foreign Trade, tha given the necessary financial hel price incentive and an efficie marketing organisation, India ca export about 1,40,000 tonnes c fruit products and earn valuabl foreign exchange to the tune of R 275 million. It has been purporte that the present yield of horticultu ral produce can be enhanced furthe provided the necessary technica guidance and long-term finance i rendered timely to the growers Th is true for not only the North-Easter region but also for the other majo fruit producing states such as Maha rashtra, West Bengal and Andhr Pradesh

Source: Survey of India's Export Potential of Fresh & Processed Fruits & Vegetables ITFT-June 1968 - Vol IB.

It may be mentionedhere that be-ides meeting the internal demand or fresh fruits, there is ample cope for exporting fruit products rovided as the pre-investment Re-ort of the region points out "we re able to compete successfully oth in respect of quality and price f products" The report has come ut with the conclusion that "Our roduction of fruits as well as ex-orts constitute such a small propor-on of world production and ex-ort that it is held by experts that e export potential of India can be ealised without much difficulty". he following table clearly indicates e position of India's share of Fresh ruits Production and Exports for e year 1965.

Similarly our yield per hectare in ertain agricultural crops is very w. For example our yield per ectare for oranges is just 10 tonnes compared to 30 tonnes in Spain, r pineapples it is a meagre 12-5 tonnes as compared to 60-70 nnes in Phillipines, and for toma-es 7 tonnes as against 30 tonnes USA and 25 tonnes in France. ence quite a lot needs to be done t only to increase our overall pro-ction, but also our per hectare eld of production. This can be done rough scientific promotion of this pe of cultivation helped by ade-ate finance, agricultural inputs d expert guidance.

In view of the peculiar position the terrain consisting of hills and lleys in the North-Eastern region, other major problem that needs to overcome is of transportation urthermore, there is an impera-e need to settle the present land nure system as most of the land is ld by tribal Chiefs. The findings the Report has stated that "this has direct relevance for the deve-lopment of crops through individual loans." For ensuring successful bank lending for investment in horticul-ture, plantation and forestry deve-lopment, the problem need to be tackled on three fronts: (i) Market-ing, (ii) Hill Area Development Approach and (iii) Strengthening the organisational setup by estab-lishing public sector undertakings. ☐

Proposed Age at Marriage

Contd from Page 8

social and economic change in the right direction. The desirable direc-tion in the present context of our country is, rightly, higher ages at marriage for both males and females than are ruling at present. Legisla-lations on age at marriage are not taken up every other year. The Sarda Act was passed in September 1929 and the next legislation putting the minimum age at marriage for females at 15 came no earlier than 1949. The Hindu Marriage Act (25 of 1956) merely confirmed the minimum age of marriage for Hindu girls at 15, and that of boys at 18. It may be argued that since the mean age at marriage for females in 1949 was already as high as 15, the 1955 legislation was merely blessing a situation already attained, and by the same token the proposed legis-lation would be ratifying a state of affairs already fairly achieved. But 1976 is not 1955 and the country can perhaps take a bigger dose of forward-looking legislation, consis-tent with the induced as well as natural current climate of family and social and economic effort. Instead of pegging a desirable as-piration to a level already largely attained by the country under its own steam, the proposed legisla-tion might think of minima which would propel the country forward from where it is. It is much better for a new piece of legislation to be a pacesetter than a status quoist.

Persons interested in population in whichever way it impinges upon present and future national life will welcome the proposed legislation for two other extremely important rea-sons. This legislation will depend upon two crucial factors for its implementation. Compulsory regis-tration of all births for proof of age on the eve of marriage if not on the eve of admission to institutions or jobs, and compulsory registration of all marriages to lend meaning to the minimum age of marriage legis-lation. These two legislations are bound to open up a whole universe of change, particularly in the status of women in our society. These two concurrent and underpinning legis-lations, rigorously enforced, will along give teeth to the minimum age of marriage legislation, which would otherwise largely remain spurned and ignored.

New Banking Policy

N. RAMACHANDRAN

COMMERCIAL BANKS have been in existence for over a century in our country. If we trace the progress of the banking system over a period of years, we can well say that banking system has been able to show good progress. The three major indicators of growth of the banking system are: growth in deposits, advances and expansion in the number of branches No doubt banks have grown in size over a period of years. We witnessed a period of consolidation between 1951 and 1969. Consolidation was facilitated through mergers/amalgamations of small uneconomic units with viable bigger banks. This way the number of banks operating in the country got reduced, while this was in no way at the cost of expansion of branches In fact the number of offices increased steadily Control over their functioning was strengthened by the Reserve Bank through licensing and inspection

The following table reveals, the trend of the growth of banking system in our country between 1951 and 1969

The table reveals the growth of the banking system, commencing from the planning era A survey of this nature, no doubt, brings to light the part played by banks in our country. But a qualitative assessment of their functioning revealed that banks were expected to perform much more than what they really did.

They have to play a changed role keeping in tune with the changing economic environment and growth strategy. For a country of our size and population it is no wonder that there is still a big backlog in developmental effort with 40 per cent of the population living below the poverty line In such a context there is greater need for supporting and supplementing the efforts of planners.

A close look at the deployment of credit in the past revealed that banks did not attach much importance to

"An Institution such as the banking system which touches and should touch the lives of millions, has necessarily to be inspired by a larger social purpose and has to subserve national priorities and objectives".

—Smt. Indira Gandhi

the growth of primary sectors like agriculture and allied activities as also the welfare of weaker/neglected sectors Till 1969 the major share of bank finance went in favour of industry and other traditional sectors only

Agriculture which plays a crucial role in our country, which generates more than 50 per cent of National Income, is responsible for more than 55 per cent of export earnings providing employment opportunities to more than 70 per cent of population, got a meagre share of hardly 2 per cent of total bank credit all these years It was realised that unless there is a major shift in the lending policy/practices forthwith any talk of promoting growth or na tional resurgence can only be a myt because of the very nature of ou economy with its strong base in th rural sector.

Further the following factoı emphasised the need for a radica change in the management of th banking system in our country.

1. Prevalence of wide gaps in re pect of geographical coverag of banks. Several states wei highly unbanked or unde banked, especially the nort and north-eastern regions suc as Madhya Pradesh, Utta Pradesh, Bihar, Orissa, Assar Jammu & Kashmir, Megha laya, Nagaland etc.
2. The problem of expansion banking offices in rural area was not thought of in the rigl perspective till June 1969. Tl percentage of rural branch to total branches of all banl were only of the order of 2 per cent in 1969 (i e. 18 branches out of 3262 branches Another indicator was the lo credit deposit ratio in rur areas. The few rural branch in existence merely siphon off funds for investment urban and metropolitan are without evincing keen inte rest in the development of ru areas.
3. The policy of planning impli formulation of lending polici in consonance with soci economic objectives. But t 1969, banks did not acco priority for adherence to s cial objectives. Alternative they were more concerned wi

Indicators of Growth

	Dec. 1951	Dec. 1956	Dec. 1961	Dec. 1966	June 196

Others	4	1	1 2	4 0	4.0
	100	100	100	100	100

safety of funds and their advances were highly security-oriented. Problems of rural credit remained outside the province of bank credit. Bank's loanable funds were disbursed only to people who were well off or had substantial means. In short, private sector banking exhibited greater concern for security of funds, quantum of return and profitability.

4. There was also need for professionalising bank managements. Those who had been connected with banking industry had no opportunity to associate themselves in the management of banks.
5. Lastly, banks are also expected to play a developlmental and promotional role in the context of planning This called for a systematic and planned approach towards branch expansion, credit planning/allocation and resource mobilisation.

Social Control :

The need for bringing banks under social control measures was felt for a long time, so that lending policy of banks could be suitably aligned with the social priorities. The National Credit Council formed in 1968 was entrusted with the task of identifying gaps as well as the deserving categories of small borrowers to meet their credit needs fully. Similarly problems of rural credit, small scale industries weaker/neglected sectors etc came to the fore, needing the attention of NCC for getting their due share in the total bank credit. Social control measures initiated in 1968 brought in its wake several administrative and legislative measures like Reconstitution of Boards, of Directors of banks, shift in lending policies, appointment of Banking Commission etc.

Nationalisation of Banks

The steps taken to achieve social control were not commensurate with the needs of the situation. Soon it was realised that social control measures by themselves cannot do much wonder. It was necessary to bring about rapid transformation in the banking system so as to see to the ushering in of a socialistic era Accordingly, 14 major banks with deposits of Rs 50 crore and above were nationalised on 19th July, 1969 The Prime Minister in her broadcast to the nation stated that Nationalisation would achieve the following objectives

1. Removal of control over the banking system by a few;
2. Provision of adequate credit to agriculture, small scale industry, exports ete;
3. Professionalisation of bank managements;
4. Encouragement of new classes of entrepreneurs;
5. Provision of adequate training to personnel and reasonable terms of service for the bank staff

Nationalisation marked an important era for the banking system Nationalisation brought 82.7 per cent of aggregate deposits and 83.6 per cent of aggregate bank credit under the direct control of the government, banks were called upon to undertake an accelerated expansion of their activities both geographically and functionally. They were expected to fill up the credit gaps and bring about desired changes in the deployment of credit, particularly to meet the needs of sectors which were hitherto starving for bank credit. They were expected to tackle problems of rural credit in the right perspective, through a phased programme of branch expansion in rural areas and also through evolution of suitable, integrated credit schemes, specially designed to meet rural credit needs. They were expected to remove regional imbalances in the spread of banking offices in the country. All these measures undoubtedly required necessary organisational/structural changes.

II

ASSESSMENT OF NATIONALISED BANKING

I. Deposit Mobilisation :

Deposits as percentage of national income moved up from 15.3 in June 1969 to 25 by December 1975. Deposits moved up from Rs 4646 crore to Rs 13,482 crore during the same period. Per capita deposit moved up from Rs 88 in June 1969 to Rs 246 by December 1975.

Similarly number of deposit accounts moved up from about 1 crore in June 1969 to about 5 crore by middle of 1976. For a country like India, banks are yet to make much headway. Mobilisation of deposits is all the more required for catering to the needs and competing claims of different sectors—in addition to meeting increasing credit needs of food procurement and also credit needs of public sector, especially since nationalisation. As such banks have to devise various schemes of deposits The need for observing the principles of flexibility and innovativeness in — deposit mobilisation hardly requires any emphasis No doubt banks have to reckon with several factors such as competition among banks; competition from corporate sector and other non-banking financial intermediaries in their task of deposit mobilisation.

II. Deployment of Credit :

Bank credit has increased from Rs 3,523 crore in July 1969 to Rs 9,769 crore by December 1975. The number of borrowal accounts increased from 10 lakh in June 1969 to 65 lakh by the middle of 1976. The priority sector absorbed Rs 2,377 crore out of Rs 9,769 crore in December 1975 (accounting for 24.3 per cent of total credit). The following are the different perspectives in credit management:

(a) Evolution of a credit plan at the micro and macro levels to plan for wise and judicious deployment of funds to the preferred sectors to meet the social objectives.
(b) A scale of priorities was drawn so as to identify the

needs of weaker/neglected sectors.

(c) Change in the concept of lending from the security-oriented approach to purpose-oriented/production-oriented approach.

(d) Area approach in lending and supervised integrated credit schemes gained more currency. Several new credit schemes came into operation specially designed to meet the needs of weaker/neglected sectors.

Banks should provide finance at concessional rate of interest at 4 per cent under *Differential Interest Rates* scheme in backward areas to help the economically backward people (satisfying certain criteria in regard to income and land holdings).

The table gives the public sector banks advances under differential Interest Ratesscheme since the inception of the scheme

PUBLIC SECTOR BANKS ADVANCES UNDER DIR

	Dec. 1972	June 1973	June 1974	June 1975
No. of Borrowal Accounts	26,202	1,08,173	2,74,826	3,47,32(
Total Amount Outstanding (in Lakhs)	87.3	432.7	1,123.4	1,484.(
DIR Advances as % to total Bank Credit	0.02	0.08	0.17	0.1§

Special schemes have also been evolved to promote employment opportunities, through self employment schemes Branch officials have been delegated with adequate powers to expedite credit sanctions leading thereby to quicker disbursement of credit. The following sectors were identified as priority/weaker sectors for the purpose of disbursal of credit,

1. Agriculture,
2. Small Scale Industry and
3. Exports falling under *Priority Sectors*

Transport operators (owner drivers), retail Traders, Small Businessmen, Professional and Self-employed, Loans for pursuit of Education etc. under weaker/neglected sectors Thakker Committee formed in 1970, recommended the establishment of Credit Guarantee Corporation of India to cover the risks involved in lending to weaker/neglected sectors. The corporation was formed in 1971.

Banks had to meet the credit needs of public sector projects such as Electricity Boards, Water and Drainage Boards, slum Clearance Boards, Housing Boards etc. In short, banks have to have a development/growth-oriented outlook while exercising their lending function.

As a result of the marked shift in the lending policies, we have a new class of borrowers today. In the past banking system never considered the following categories of people as worthy risk for extending credit. But things have changed so much that banks' share of advances to these categories of people show increasing trend. The examples of new class of beneficiaries are: Launderers; barbers; tailors; cobblers; roadside hawkers; vegetable vendors, small businessmen; artisans; physically handicapped; indigent students; tribal people; refugees; lepers; beggars; prisoners in jails; ex-convicts; destitutes, orphans; sanitary workers etc.

Apart from these, banks provide several social services such as conducting classes on health, sanitation, adult literacy, family planning etc in rural areas.

They also associate in the collection and distribution of medicines freely to the poor through drug banks and supply books to indigent students through Book Banks Besides they impart technical training to artisans and craftsmen; instructions in management principles; accounting etc. to businessmen and entrepreneurs.

The pattern of advances to the priority sector by public sector commercial banks since 1969 is presented in Table 1 at the end.

Similarly the trend of growth of borrowal accounts relating to priority sector advances of nationalised banks between June 1969 and September 1975 is presented in Table II at the end.

Financing Exports :

Export Trade constitutes a vital sector of the nation's economy. Liberal credit facilities are therefore made available to exporters as part of the overall scheme for export promotion. As at the end of June 1969 export credit amounted to Rs 270 crore only but by April 1976, it had moved upto Rs 981 crore. The extent of financial assistance rendered since 1969 is gvien below:

Twenty Point Economic Programme:

The Prime Minister said that the object of the 20 Point Economic Programme is an honest attempt to help the havenots and the weaker sections in the country. It is a programme of the people, fo[r] the people and by the people. Each one should participate in it to mak[e] it a success.

With the announcement of th[e] 20 Point Economic Programme by the Prime Minister on July 1, 1975 the role of banks has considerabl[y] enlarged.

A striking feature of the 20 Poin[t] Economic Programme is its realistic approach and the sense of urgency it has generated in the countr[y] through multipronged attack on th[e] immediate problems facing th[e] country, more particularly to increase the production of essentia[l] commodities, to ameliorate the conditions of the weakest among th[e] weaker section of the population. Banks are exhorted to effectively respond to the emerging need[s] of the community by associatin[g] themselves with the programme i[n] so far as they relate to provision o[f] finance to landless labourers, bonded labourers, small and margina[l] farmers, artisans etc.

Out of 20 points, the following 1[2] points are of much relevance:

1. Procurement and distributio[n] of essential commodities;
2. Assistance to landless labourers being allotted house sites
3. Assistance to landless labourer[s] being allotted land;
4. Assistance to released bonde[d] labourers;
5. To fill the credit gap followin[g] moratorium on rural indebtedness and its progressive liquidation;

Scheduled Commercial Banks Advances to Exports

Year	Export Finance (in crore)
June 1969	270
Dec. 1969	303.1
Dec. 1970	366.1
Dec. 1971	459.3
Dec. 1972	461.5
Dec. 1973	689.4
April 1974	749.0
April 1975	834.0
April 1976	981.0

6. Implementation of minor irrigation programmes;
7. Assistance to handloom sector;
8. Workers association in industry;
9. Assistance to holders of national permit for road transport;
10. Scheme of supplying essential commodities to students in hostels;
11. Scheme of supplying books and stationery to students at controlled prices;
12. Apprenticeship Scheme for enlarging employment and training opportunities

These are the key areas where banks have a definite role to play For effective implementation of the 20 Point Programme, banks have to continuously monitor the progress made by them and take necessary corrective steps wherever required.

III. Branch Expansion :

The most significant achievement has been the rapid expansion of the branch network in the country. The total number of branches has increased fom 8262 at the end of June 1969 to 20446 at the end of December 1975 As a result the population per banking office got reduced from 65,000 to 27,000 during the period under review.

Poorly Banked States :

Banks have also consciously endeavoured to go into areas that in the past were altogether neglected by them. As a result the rate of opening of branches in poorely banks states has been much higher than the national average. The table shows the progress achieved by Commercial Banks in reducing the regional imbalances in their branch network

It would be observed that population coverage of commercial banks has greatly improved in states like Assam, Meghalaya, Nagaland, Bihar Orissa, Uttar Pradesh, Madhya Pradesh. Jammu & Kashmir, which were poorly served by the banking system. Please refer to Table III for a detailed analysis of branch network between 1969 and 1975.

Going to Rural Areas

In the pre-nationalisation period banks presence in the rural areas was more in the nature of an exception than the rule During post-nationalisation period, banks have made concerted efforts to spread their branch network in rural areas. While there were only 1,832 rural branches in June 1969, the number of rural branches has increased to 7,376 by December, 1975 — the percentage share of rural branches to total branches showing an increase from 22 per cent in June 1969 to 36% by December 1975. Further, the number of new branches opened in rural areas during post-nationalisation period accounted for as high as 48% of the total number of branches pened by them. Table IV at the end presents the trend of growth of banking offices centrewise in our country between June 1969 and December 1975.

Lead Bank Scheme

The concept of Lead Bank Scheme was evolved as a result of the deliberations of the Nariman Committee, appointed by RBI in 1969 Under the scheme, all the districts in the country, with the exception of certain metropolitan cities and union territories have been allotted among public sector banks and few private sector banks The leadbank has to assess the resources and potential for expansion of branches and diversification of credit facilities in the district allotted to it, to act as consortium leader to invoke the cooperation of other banks operating in the district for mobilisation of deposits and to locate the actual and potential credit needs The role of the lead bank is to supplement the efforts of the developmental authorities. In pursuance of the objectives of the lead bank scheme, public sector banks have strengthened their branch network and established necessary machinery for securing coordination between the activities of financial institutions and the developmental agencies at district levels/state levels The first phase of the scheme has already been completed and attention is now given towards formulating specific bankable area schemes, aimed at facilitating the flow of increased credit into sectors which occupy critical positions in the overall schemes of economic development of particular areas

The lead banks have started formulating credit plans for their lead districts for identifying sectoral requirements of credit and drawing up a programme for meeting these demands. They have familarised themselves with the economic and social structure of these areas allotted to each one of them and are actively collaborating with other development agencies for harnessing their growth potential.

Regional Rural Banks

As part of the implementation the 20 Point Economic Programm a new institution in the form Regional Rural Bank has be created. The need for such an insi tution was felt which could combir the local knowledge and familiarit with the rural problems which th cooperatives possess and the degre of organisation, ability to mobilis deposits, access to central mone markets and a modernised outloo which the commercial banks have These institutions will be basicall scheduled commercial banks bu will differ from the existing com mercial banks, in that their area o operation will be limited to a speci fied region in any state. They wil grant loans and advances to smal and marginal farmers; agricultura labourers; rural artisans; smal entrepreneurs and persons of small means engaged in trade/productive activities. The lending rates will not be higher than the prevailing lending rates of cooperative societies in the particular states Five regional banks (2 in U.P., one each in Rajasthan, West Bengal, Haryana) were established on October 2, 1975 to being with. Till now 22 banks have been established and steps are under way to see that 50 regional banks are established all over the country before this year end

Consumption Loans :

While loans for consumption purposes were not encouraged by banks in the past, they havenow become a necessity with the avowed objective of extinguishing money lenders in gradual stages from the rural-urban sceme. It is observed that consumption loans are sought after by landless labourers, artisans. urban workers and middle class people for meeting barest necessities of life like food, clothing, medical bills as also for social exigencies and purchase of consumer durable. As such banks have to come out with suitable schemes with sufficiently longer repayment schedules so that loans could) be recovered in convenient instalments, without risk. However, there must be machinery for collection and appropriation of dues from out of the wages paid, right at the source of payment.

Similarly loans are also required by craftsman, retailers and small traders for payment of wages, electricity, tax dues as also for maintenance of their families, till income is generated or income is realised out of sales. Here again such proposals are also to be considered as bankable

and suitable repayment schedules fixed so as to be of service to such people. The feasibility of levying specially lower rate of interest for consumption loans extended to weaker section of the society be considered in the light of the peculiar difficulties experienced by such class of people.

Conclusion :

The aim of the banking policy in India is to uplift the underprivileged class in rural India from subsistence to surplus existence A bank is a community based organisation and it should take steps on an ongoing basis to blend its business goals with social obligations. The progress of the banking system is quite phenomenal both quantitatively and qualitatively.

No doubt banking industry has come a long way after nationalisation. The banking system has undergone a total metamorphosis. It is well poised for a major break through to become effective instrument for economic development and social change. Conceptually Indian Banking has become mass banking over the years.

The pace and expansion of the banking system during post-nationalisation period has been very fast placing heavy demands on its ingenuity and resources The capacity of the banking system to play the role of a catalyst in development has considerably improved Banks have by and large responded to meet the new challenges

However a study of this nature brings to light the various problems of concern to the banking industry in the current context.

First and foremost is rendering efficient *customer service*. Banking is essentially a service oriented industry. Customer is the bread and butter of the banks. Banks have to devote continual attention to ensure customer satisfaction. Customers want prompt, courteous and personalised attention. The Report of the Talwar Committee is expected to pave the way for providing better and efficient service to the customers.

2. *Development of Credit* : New obligations have been cast upon the banking system to fulfil the credit needs for socio-economic purposes. We witness structural changes in the organisation as also in the credit structure taking care of the simple needs of smaller people as well as increasingly complex needs of sophisticated and diversifying industrial sector. But the small man and poorer sections of the population are still woefully starved of finance in short need for helping the poorer among the poor Their problems need to be analysed in greater depth and specialised schemes will have to be drawn to rescue them from the strangle hold of moneylenders—a really challenging task, indeed! Similarly problems of credit to agricultural sector have assumed huge proportion. In addition, Banks have to support village industries food processing programmes and the tertiary sectors in rural areas Further, banking industry has been called upon to play a developmental role, which has been put in sharper focus by the 20 Point Economic Programme launched by our beloved Prime Minister

3. *Branch Expansion* : Banks have to make much headway in this regard. We require a minimum of 50,000 offices for a country of our size so that problems of growth and development especially in the rural sector could be tackled with a pragmatic approach This will also ensure securing a better and more equitable geographical dispersal of offices. The recent efforts at extension of banking facilities through rural branches has raised the credit deposit ratio in rural areas from 36 per cent in 1969 to 53 in 1974 The perspective plan for branch expansion between 1976 and 1978 includes plans for opening large number of branches particularly in unbanked areas in Eastern and North-eastern Regions

4. *Resource Mobilisation* : Need for introduction of novel and innovative schemes of deposits hardly requires any emphasis, especially at a time when banking system is to meet increasing credit needs of different sectors Deposits are the wherewithal of the banking system to serve the Community. With the increase in rural branches and improved/revolutionary cultivation practices, agricultural incomes have shown an increasing trend. Banks will have to take effective steps to tap rural savings. It is suggested that there be reduction in margin/rate of interest on loans against deposits, to help banks in mobilising deposits. The cumulative/recurring deposit schemes of banks if recognised on a par with postal CTD's for rebates/reliefs from income tax are likely to become more popular and help banks to boost their deposits. The problem of competition for deposits among banks by adoption of several methods (which are invariably at the expense of the depositor) is a matter for developing a code of conduct among banks.

5. *Modern Management Techniques* : Modern Management Techniques including automation/mechanisation have to be employed to the desired extent expecially in an expansionary phase Development of management science to improve decision making by resorting to new tools is an urgent necessity today. A few of the areas where management science techiques as an aid to managerial decision making may be made applicable are: Profitability planning; loans and deposits forecasting; credit rating; Bank Cost Accounting; Manpower Planning; asset management; market analysis etc.

6. *Operational Efficiency* : Operational efficiency is to be improved by giving serious thought to reviewing procedures, practices as also cutting down delays in such matters as opening of accounts, encashment of cheques, appraisal of loan applications etc A few of the areas where attention cold be focussed are:

(a) simplification of forms, procedures etc
(b) review of reporting techniques
(c) proper techniques of cash/asset management
(d) rendering efficient customer service
(e) ensuring fair degree of profitability
(f) setting up well designed Management Information Systems to help in policy formation, performance evaluation and control
(g) setting up O & M/Economic research departments
(h) Increasing productivity of employees through fixation of man hours for each job
(i) effective supervision and control
(j) redesigning internal organisation structure to ensure flexibility, growth and development
(k) installation of Costing System
(l) to make headway in operations research.

7. *Recovery of Loans* : Need for flexible system of making recoveries of loans to avoid timelags, expense etc Present practices consume lot of time and also involve considerable cost.

8. *Credit Information* : Absence of suitable credit information agency is keenly felt. Setting up of a credit information bureau will help all banks to make use of the same for taking proper credit decisions.

9. *Inter-bank Transactions* : Service/Collection charges for inter-

6. Implementation of minor irrigation programmes;
7. Assistance to handloom sector;
8. Workers association in industry;
9. Assistance to holders of national permit for road transport;
10 Scheme of supplying essential commodities to students in hostels;
11. Scheme ot supplying books and stationery to students at controlled prices;
12. Apprenticeship Scheme for enlarging employment and training opportunities.

These are the key areas where banks have a definite role to play For effective implementation of the 20 Point Programme, banks have to continuously monitor the progress made by them and take necessary corrective steps wherever required.

III. Branch Expansion :

The most significant achievement has been the rapid expansion of the branch network in the country The total number of branches has increased fom 8262 at the end of June 1969 to 20446 at the end of December 1975 As a result the population per banking office got reduced from 65,000 to 27.000 during the period under review.

Poorly Banked States :

Banks have also consciously endeavoured to go into areas that in the past were altogether neglected by them. As a result the rate of opening of branches in poorely banks states has been much higher than the national average. The table shows the progress achieved by Commercial Banks in reducing the regional imbalances in their branch network

It would be observed that population coverage of commercial banks has greatly improved in states like Assam, Meghalaya, Nagaland, Bihar Orissa, Uttar Pradesh, Madhya Pradesh, Jammu & Kashmir, which were poorly served by the banking system. Please refer to Table III for a detailed analysis of branch network between 1969 and 1975.

Going to Rural Areas

In the pre-nationalisation period banks presence in the rural areas was more in the nature of an exception than the rule. During post-nationalisation period, banks have made concerted efforts to spread their branch network in rural areas. While there were only 1,832 rural branches in June 1969, the number of rural branches has increased to 7,376 by December, 1975 — the percentage share of rural branches to total branches showing an increase from 22 per cent in June 1969 to 36% by December 1975. Further, the number of new branches opened in rural areas during post-nationalisation period accounted for as high as 48% of the total number of branches pened by them. Table IV at the end presents the trend of growth of banking offices centrewise in our country between June 1969 and December 1975

Lead Bank Scheme

The concept of Lead Bank Scheme was evolved as a result of the deliberations of the Nariman Committee, appointed by RBI in 1969. Under the scheme, all the districts in the country, with the exception of certain metropolitan cities and union territories have been allotted among public sector banks and few private sector banks. The leadbank has to assess the resources and potential for expansion of branches and diversification of credit facilities in the district allotted to it, to act as consortium leader to invoke the cooperation of other banks operating in the district for mobilisation of deposits and to locate the actual and potential credit needs The role of the lead bank is to supplement the efforts of the developmental authorities. In pursuance of the objectives of the lead bank scheme, public sector banks have strengthened their branch network and established necessary machinery for securing coordination between the activities of financial institutions and the developmental agencies at district levels/state levels The first phase of the scheme has already been completed and attention is now given towards formulating specific bankable area schemes, aimed at facilitating the flow of increased credit into sectors which occupy critical positions in the overall schemes of economic development of particular areas.

The lead banks have started formulating credit plans for their lead districts for identifying sectoral requirements of credit and drawing up a programme for meeting these demands. They have familarised themselves with the economic and social structure of these areas allotted to each one of them and are actively collaborating with other development agencies for harnessing their growth potential.

Regional Rural Banks

As part of the implementation of the 20 Point Economic Programme, a new institution in the form of Regional Rural Bank has been created. The need for such an institution was felt which could combine the local knowledge and familiarity with the rural problems which the cooperatives possess and the degree of organisation, ability to mobilise deposits, access to central money markets and a modernised outlook which the *commercial banks* have. These institutions will be basically scheduled commercial banks but will differ from the existing commercial banks, in that their area of operation will be limited to a specified region in any state. They will grant loans and advances to small and marginal farmers; agricultural labourers; rural artisans; small entrepreneurs and persons of small means engaged in trade/productive activities. The lending rates will not be higher than the prevailing lending rates of cooperative societies in the particular states. Five regional banks (2 in U.P , one each in Rajasthan, West Bengal, Haryana) were established on October 2, 1975 to being with. Till now 22 banks have been established and steps are under way to see that 50 regional banks are established all over the country before this year end.

Consumption Loans :

While loans for consumption purposes were not encouraged by banks in the past, they havenow become a necessity with the avowed objective of extinguishing money lenders in gradual stages from the rural-urban sceme. It is observed that consumption loans are sought after by landless labourers, artisans. urban workers and middle class people for meeting barest necetsities of life like food, clothing, medical bills as also for social exigencies and purchase of consumer durable. As such banks have to come out with suitable schemes with sufficiently longer repayment schedules so that loans could) be recovered in convenient instalments, without risk. However, there must be machinery for collection and appropriation of dues from out of the wages paid, right at the source of payment.

Similarly loans are also required by craftsman, retailers and small traders for payment of wages, electricity, tax dues as also for maintenance of their families, till income is generated or income is realised out of sales. Here again such proposals are also to be considered as bankable

and suitable repayment schedules fixed so as to be of service to such people. The feasibility of levying specially lower rate of interest for consumption loans extended to weaker section of the society be considered in the light of the peculiar difficulties experienced by such class of people.

Conclusion :

The aim of the banking policy in India is to uplift the underprivileged class in rural India from subsistence to surplus existence. A bank is a community based organisation and it should take steps on an ongoing basis to blend its business goals with social obligations. The progress of the banking system is quite phenomenal both quantitatively and qualitatively.

No doubt banking industry has come a long way after nationalisation The banking system has undergone a total metamorphosis It is well poised for a major break through to become effective instrument for economic development and social change. 3. *Branch Expansion* : Banks have to make much headway in this regard. We require a minimum of 50,000 offices for a country of our size so that problems of growth and development especially in the rural sector could be tackled with a pragmatic approach This will also ensure securing a better and more equitable geographical dispersal of offices. The recent efforts at extension of banking facilities through rural branches has raised the credit deposit ratio in rural areas from 36 per cent in 1969 to 53 in 1974 The perspective plan for branch expansion between 1976 and 1978 includes plans for opening large number of branches particularly in unbanked areas in Eastern and North-eastern Regions

4. *Resource Mobilisation* : Need for introduction of novel and innovative schemes of deposits hardly requires any emphasis, especially at a time when banking system is to meet increasing credit needs of different sectors Deposits are the wherewithal of the banking system to serve the Community. With the increase in rural branches and improved/revolutionary cultivation practices, agricultural incomes have shown an increasing trend. Banks will have to take effective steps to tap rural savings. It is suggested that there be reduction in margin/rate of interest on loans against deposits, to help banks in mobilising deposits. The cumulative/recurring deposit schemes of banks if recognised on a par with postal CTD's for rebates/reliefs from income tax are likely to become more popular and help banks to boost their deposits. The problem of competition for deposits among banks by adoption of several methods (which are invariably at the expense of the depositor) is a matter for developing a code of conduct among banks.

5. *Modern Management Techniques* : Modern Management Techniques including automation/mechanisation have to be employed to the desired extent expecially in an expansionary phase. Development of management science to improve deeision making by resorting to new tools is an urgent necessity today. A few of the areas where management science techiques as an aid to managerial decision making may be made applicable are · Profitability planning; loans and deposits forecasting; credit rating; Bank Cost Accounting; Manpower Planning; asset management; market analysis etc.

6. *Operational Efficiency* : Operational efficiency is to be improved by giving serious thought to reviewing procedures, practices as also cutting down delays in such matters as opening of accounts, encashment of cheques, appraisal of loan applications etc A few of the areas where attention cold be focussed are:

(a) simplification of forms, procedures etc
(b) review of reporting techniques
(c) proper techniques of cash/asset management
(d) rendering efficient customer service
(e) ensuring fair degree of profitability
(f) setting up well designed Management Information Systems to help in policy formation, performance evaluation and control
(g) setting up O & M/Economic research departments
(h) Increasing productivity of employees through fixation of man hours for each job
(i) effective supervision and control
(j) redesigning internal organisation structure to ensure flexibility, growth and development
(k) installation of Costing System
(l) to make headway in operations research.

7. *Recovery of Loans* : Need for flexible system of making recoveries of loans to avoid timelags, expense etc. Present practices consume lot of time and also involve considerable cost

8. *Credit Information* : Absence of suitable credit information agency is keenly felt. Setting up of a credit information bureau will help all banks to make use of the same for taking proper credit decisions.

9. *Inter-bank Transactions* : Service/Collection charges for inter-

(Figures in brackets indicate percentage to total credit).

bank transactions be done away with atleast among nationalised banks so that the benefit accruing as a result of this be passed on to the customers

10 *Uniformity in Systems, Procedures ; & Practices* · Standardisation of systems and procedures and streamlining of administrative methods are desired among the nationalised banks

11. *Systematic development of human resources* is quite essential to cope up with the manpower requirements. The problem of rendering efficient service centres round on the ability of the banking system to have talented staff which could be achieved through suitable recruitment, selection and training programmes. Thanks to the efforts taken for the setting up of National Institute of Bank Management in 1969, an apex body for training of bank personnel. The Institute is engaged in providing training to higher level personnel in management and functional areas; research into problems of concern to the banking industry; providing consultancy to individual banks to translate policies and also offering education at postgraduate level.

12. *Flexibility in Operations* . The expansion of the magnitude which the banking system has witnessed in the recent past, has thrown up tremendous challenges and brought to the fore serious problems of internal administration and control The scope and coverage of guarantee organisations have been (CGO & CGOI) considerably enlarged. The definition of small scale industry itself was revised by raising the amount of investment in plant and machinery to Rs 10.00 lakh. Various incentives have been provided for promotion of industries in backward regions. The insurance cover for deposits of commercial—cooperative banks was increased to Rs 20,000/- effective from 18th July

TABLE II

Borrowal Accounts of Public Sector Banks to Priority Sector

(In '000)

	June 1969	June 1971	June 1973	June 1975	Sep 1975

Prof/Self-Employed	8	42	107	207.5	221
Education	2	7	10	12	15
TOTAL :	260	1136	1873	3301	3718

The total number of borrowing accounts moved up from 2,60,142 to 37,18,898 between June 1969 and September 1975

1976. Reserve Bank has come out with ceilings for maximum rate of interest on advances as also interest rates for overdue advances. The credit policy pursued by Reserve Bank was development/growth oriented and banks could respond to the directives of RBI from time to time. Further, Banks have to coordinate their efforts with cooperatives and other developmental agencies.

13. *Role of Employees* : The greatest asset of a bank are its men. The performance of the banks in the developmental and catalytic roles is inextricably interwoven or linked with attitudes of employees towards their organisation, superiors and last but not the least customers. There is need for national outlook and sense of participation for employees working in banks. If banking is to succeed, employees must know how to move with customers and create good image in them. Proper training and motivation will help to achieve the desired results. The problem of motivating employees to give out their best willingly and creatively is an art. Successful management believes that with proper orientation and motivation, it could be possible to bring about necessary attitudinal changes in employees. The importance of human relations hardly requires any emphasis in this context. Bank employees will have to identify themselves with the way of life, problems, hopes and aspirations of the people in the areas where they serve. Banks have to bestow attention in such areas as training, job enrichment, job enlargement, job satisfaction, suitable appraisal systems etc. for improving efficiency and enlisting employees support. Management has to make work assignments a more satisfying experience for every employee and at the same time tap his energy, enthusiasm, knowledge and creativity to the fullest extent.

14. *Development of Successful Managers* : Good management is a critical input in the success of a business. Bank Manager, who is the man on the spot, is everything rolled in to one agent, legal adviser, accounts specialist, technical expert, personnel manager, management specialist, financial wizard etc. He has to play different roles successfully. Manager has therefore to face tremendous challenges. Added to his usual roles, he is presently to accept the role of a pioneer for implementing the 20 *Point Economic*

Yojana Quiz

1 First telegraph line opened between England and India.
(*a*) 1757
(*b*) 1851
(*c*) 1865

2 First exhibition of Cinema in India was on
(*a*) 3 February 1801
(*b*) 7 July, 1896
(*c*) 1 June 1905

3. First talkie film in India was shown at Elphinstone Picture Palace, Calcutta in
(*a*) 1896
(*b*) 1910
(*c*) 1929

4. When was the playback system in the films introduced in India?

5. The first woman Chief Minister in India was :
(*a*) Sarojini Naidu
(*b*) Sushila Nayar
(*c*) Sucheta Kripalani

6 Name the places:
(*a*) City of dreaming spires
(*b*) Eternal City
(*c*) World's loneliest island
(*d*) Garden of India

7. The deepest lake in the world is
(*a*) Dal
(*b*) Ozero Baikal
(*c*) Lago Titicaca

8. What is the world record for rope-skipping?

9. Three lions from the Gir forest were released in U.P where?

10. What is the widest waterfall in the world ?

Answers

1. (*c*) 27th January, 1865, 2. (*b*) First exhibition of Cinema in India was by Lumiere Brothers on July 7, 1896.
3. (*c*) The film Universal Melody of Love was shown in the year 1929
4. In 1934 in a Bengali film Bhagyachakra directed by Nitin Bose
5 (*c*) Suchota Kripalani U.P 1963-67, 6 (*a*) Oxford, (*b*) Rome, (*c*) Tristan da Cunha (Mid-Atlantic), (*d*) Bangalore, 7. (*b*) **Ozero Baikal** (Siberia) average depth nearly 2,300 ft deepest part 6,365 ft.
8. 32,089 turns (without a break) by J P. Hughes in 3 hrs. 10 min on October 26, 1953 9 Chandraprabha Sanctuary
10 Khone falls (Laos) with a width of 6 7 miles and a flow of 1,500,000 cu ft per sec.

Quotation Box

Democracy cannot be a one-sided thing. It can only work if all sections subscribe to it and are willing to curb their liberty to that extent where it treads on the liberty of others. Only then democracy can function.

ABUJHMAD—The Land and Its People

N. D. SHARMA **Photographs : P. K. KAPOOR**

There are several text-book examples of development efforts in the tribal and backward regions of India Perhaps none can be so interesting for the challenge that such regions throw up as Abujhmad in Madhya Pradesh Here you have the classic example of a people in whose vocabulary change finds no place Insular shy, sensitive and contented, the people of Abujhmad are poor even by Indian standards

The following spot report by Shri N D. Sharma who trekked in this district and talked to people there reveals the many facets of the problem of development

THE 14,000-odd inhabitants of the Abujhmad region in Bastar district in Madhya Pradesh are referred to as the "Children of Nature". They are a simple, sturdy, hard-working people, deeply attached to their land, their numerous deities and their beliefs They are completely unaware of the modern, civilized world

Abujhmad covers an area of about 2,200 square kilometres in Naryanpur, Bijapur and Dantewara tehsils in the southern part of the district It is a rough, rugged and mountaneous terrain, impossible for outsiders to penetrate except during the few summer months Flooded streams and dense forests infested with wild animals make walking in the area a hazardous venture for the good part of the year

Till about a decade ago Abujhmad was practically a landlocked island shrouded in complete mystery. Only second-hand and third-hand accounts of the life of the people were available Hardly anyone ventured to go there and see for himself how the tribals of the area lived A book on Bastar (published in 1967) says, "Persons who have crossed Abujhmad from end to end during the last 100 years could be counted on the fingers of one hand".

Things have, however, changed a bit during the last six or seven years. A few official survey parties have visited the area, thanks to the initia-

tive of an enterprising administrator, Mr B.D. Sharma, who was Collector of Bastar district for a number of years. Based on the reports of these survey parties, a core programme for the development of Abujhmad has been prepared. Its implementation, though, requires a very high level of dexterity on the part of those entrusted with the task.

The Abujhmadias, as the inhabitants of the area are known, are a very sensitive, shy and proud people. They obviously resent any offer of outside help. I got an opportunity of visiting the area and talking to the people last April when I accompanied Mr Arvind Netam, Union Deputy Minister for Education and Social Welfare, in his four-day *padayatra* across Abujhmad. We entered the region from the south – at Bedre village – and walked northward covering a distance of some 100 kilometres.

By our standards, the Abujhmadias are a very poor people. Kallu (about 35) of Lanka village could not tell me what might be the biggest amount of money with a single family in his village but he recounted several families who he said did not have even a single rupee with them. Kallu, who had once worked as a casual labourer in the adjoining Chanda district of Maharashtra and could speak a little bit of Hindi, had seen 20-rupee and 100-rupee notes. But none of the other five persons I talked to could even claim to have seen such currencies. Two of the five had not seen even a ten-rupee note.

Through Kallu I asked a group of Lanka women what they expected the Government to do for them.

The women, many of them carrying emaciated babes in their arms looked at Kallu, then at me, apparently trying to understand my question. There was no reply.

The question was repeated with a little modification: "The Government wants to help you. What are your needs?"

The women chuckled. Again there was no reply.

Still I asked the village man to repeat the question once again. He repeated it.

This time the women discussed among themselves for a while. Then some of them replied almost at the same time: "We do not need anything."

The feelings of Abujhmadias in regard to outside help were better expressed by an old lady, named Gogai, at Padmeta village in the interior of Abujhmad. She was asked the same question: "If the Government were to offer help to you, in what form would you expect it?

Gogai replied, "My two sons look after me very well. I do not want anything."

'Well, do your sons need any assistance from outside?" I asked.

"No, they are strong enough to fend for themselves."

"O.K., you have two sons. What about those who have no sons or no one to support them and are not strong enough to work for themselves", I persisted.

Paddy husking is done by the tribals in the time honoured fashion. The rice thus pounded retains much of the bran which is rich in Vitamin B

A village market is usually held once or twice a week. People come here to sell and buy. Barter is very common.

Without the slightest hesitation, Gogai said: "The community takes care of them."

After a short pause she added· "If someone comes to our village, we do not expect anything from him."

The men and women standing nearby nodded in support The happiest among them appeared to be Gudchha, Patel of the village, who had been trying to convey to me the same thing in our half hour meeting. As I left Gogai's place, the Patel rushed to her and told her something which I understood to be his gratitude towards the old lady for giving right answers to my questions.

The entire Abujhmad region has been kept out of normal administration for the last 40 years or so Revenue, forest, excise and police laws have been made inapplicable to the inhabitants of the area. They manage their own affairs according to their tribal customs.

An outsider wishing to go to Abujhmad has to obtain prior permission from the authorities Photography in the area is restricted. Under no circumstances is a movie camera allowed inside the territory The officials explain that these steps have been taken with a view to protecting the innocent tribals from contractors, preachers, filmshooters and other species of exploiters An inevitable outcome of these steps has been the complete isolation of the inhabitants of Abujhmad from the rest of the world

No wonder that the Abujhamadias still live a primitive life They belong to a branch of the Gonds and speak a dialect called Madia By and large, they have dark complexion but sharp features though occasionally one would come across a man with surprisingly fair colour. Only those who have worked at one time or another as casual labourers at some faraway places can count upto ten

An Abujhmadia's first love is his land where his forefathers lived and cultivated A village named Kutul was once deserted because of prowling tigers. This was in the latter half of the sixties. The village remained deserted for six years. The villagers would come there once every year for "dhoomamati" – worship of their fatherland In 1971 when the danger from the tigers was removed, all the villagers returned to their old place

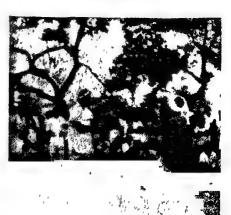
The number of villages in Abujhmad has been estimated in an official survey report at 200. There are not many villages with populations nearing the figures of 200. Some villages have as few as half a dozen families, the number of persons in a family averaging between four and five. A large number of villages have populations of 50 to 100.

Houses are made of bamboos, bushes and grass – without a trace of cement or brick Each house has a courtyard fenced by the bamboos. Houses are generally neat and clean. The Abujhmadias' household things are very few. Metal utensils are extremely rare. Their main diet is *kosra*, an inferior variety of rice, which they grow – along with some pulses and vegetables – on slanting hillocks after clearing and burning the woods. They cultivate a given area for two or three years and then shift the site of cultivation to another nearby hillock. This is called 'penda' cultivation similar to jhooming Sometimes, as they change over to a new site for "penda" cultivation they shift their village also.

"Penda" cultivation always depends on moderate rains In any case the crop is never sufficient for them So they supplement their agricultural produce with forest fruits roots and flowers and meat which now has become scarce.

Their principal meal consists of boiled kosra—liquid as well as dry—with a little salt. An Abujhmadia walks 100-150 kilometres to some peripheral town to buy salt or cloth the only important commodities they need from outside Their clothing requirements are very little They require just a small piece of cloth to wrap round their loins They get salt or cloth in exchange for agricultural or forest produce which they carry with them. Money hardly plays any role in their lives

They are a sturdy people but find themselves helpless in the face of

Cock fight is a very popular sport at the village market


deadly diseases, common in the area. A health survey conducted in Abujhmad notes poignantly that the Abujhmadia "has a great but totally underserved reputation for his skilful use of herbs and roots to treat the sick. Actually the helplessness of the Abujhmadia in the face of the simplest injury or ailment is pathetic. A simple sore caused by a thorn is neglected till the limb becomes one big vast sore".

The primary need of the Abujhmadias is, thus, of medical facilities. Some discussion has already gone on how this can best be provided. Posting a doctor here and a doctor there will not serve any purpose as the area is so vast and the villages are widely scattered A mobile dispensary on a jeep is unthinkable as there are no roads in the entire region. One plausible suggestion is ,o organize a few peripatetic eams of doctors which could visit fixed centres on fixed days of the week and administer drugs to the sick. Another suggestion worth consideration is to stock the *ashram pathshalas* (residential primary schools) with some patent medicines and give a short training to headmasters in the administration of these medicines There are already eight such schools in Abujhmad and more will be opened in course of time

Their next requirement is of salt and cloth. For this, shops can be opened at selected villages where the tribals should be able to buy these and other essential things at reasonable prices.

However, the real difficulty will arise when efforts are made to open up Abujhmad for development. The Abujhmadias look upon outsiders as harbingers of evil The official survey report points out that a sizeable number of the inhabitants of Abujhmad consist of those who have, during the past decade or so, migrated from the adjoining tribal areas where some development work was started. Similarly, the construction of a road near the Abujhmad border led the tribals to withdraw deeper inside the territory.

The survey report warns—and very rightly—that it would be tragic if the Abujhmadia is harassed in the name of development. Any road construction programme in the area has therefore, to be taken up with great caution. There is also a fear that roads will bring a large number of traders, contractors and others who will start exploiting the Abujhmadias as they have done in other

Like all tribal folk, the people of Abujhmad love to dance and sing to the beat of drums

Below: An enthusiastic crowd watching a folk dance

[illegible] by [illegible] [illegible] taking up road construction programmes in Abujhmad, it will be important if some sort of land survey is made in the area and records of land ownership are prepared. This will prevent encroachment by outsiders. But preparation of such records will not be an easy task for at least two reasons. First, there is no concept of private property in Abujhmad. The land belongs to the community, not to individuals. Secondly, they view with suspicion anything being done by outsiders. So, this task will have to be handled with great care.

It is a moot point whether introduction of irrigation schemes in Abujhmad at the present stage will bring about improvement in the agricultural yield. The survey report says that 85 per cent of the fallow land in Abujhmad is that on which "penda" cultivation had been done earlier. It is also true that the yield in "penda" cultivation is never sufficient for their bare sustenance. But the Abujhmadias are greatly attached to their "penda" cultivation. Introduction of anything which may interfere with their "penda" cultivation has, to wait till the tribals themselves see the futility of such an exercise and feel the need for better methods of cultivation, which can give them greater yields at less trouble.

Meanwhile, a detailed survey of soil in the area can be done with a view to finding out what else can be grown there and if it is possible to grow fruit-bearing trees like guava, mango, fig, etc. The Abujhmadias' right in the forests should not, be disturbed. Thought can also be given to setting up—though gradually—dairy farms, piggeries and poultry farms in the area. The people can also be trained in small scale industries. The [illegible] part of Abujhmad, to give an example, abounds in bamboos and the inhabitants of this region can be given training in bamboo work.

[illegible] the transportation out of Abujhmad and sale of their products—agricultural, forest or otherwise—would have to be entrusted to some governmental agency. One suggestion is to set up centres at [illegible] places where the Abujhmadias can bring their commodities for sale. From these centres the commodities can be transported out of the region by the agency constituted for the purpose. Till roads are constructed, introduction of mules in the region for transportation can be considered.

Mr Arvind Netam questioned a number of Abujhmadias on the general administrative structure in the adjoining region with which the Abujhmadias are somewhat familiar. Each one of them strongly resisted any idea of introducing the systems of patwaris and forest guards. An Abujhmadia is keenly aware of the manipulations which petty officials are capable of. They would be happy with their present system of "self-management" in their territory. Some of the headmen said they would not mind construction of a road in the area but would not like a merchant to come and settle on the roadside. They would continue with walking long distances to make their purchases rather than have a trader from outside settle down there. The Abujhmadias think that in the adjoining areas a number of money lenders and traders who came from outside have deprived tribals of their lands. Naturally, the Abujhmadias resent any suggestion for bringing about any change in the present set-up.

In his report to the Prime Minister about his impressions of Abujhmad Mr Netam has cautioned that a "stereotyped programme of development" is likely to do more harm than good to the Abujhmadias. He has suggested that the entire Abujhmad area may be managed by a "panchayat" comprising the village leaders of the area. They should be given enough powers for the management of their economy including the development programmes in which they should be assisted by sympathetic and dedicated officers. It is necessary that all those who opt for service in this area "which is one of the most difficult terrains in the central India" are suitably compensated and their services recognised according to Shri Netam. □

MADHYA PRADESH

An Impressive Record in Family Planning

MADHYA PRADESH HAS achieved a near miracle with its excellent performance in family planning this year by completing 8,04,739 sterilizations till December 14, 1976. This represents a 300 per cent improvement in achievement and, thus Madhya Pradesh became the first State to cross the figure of three-times the annual target—2,67,500. This has been possible in the first eight months of the current financial year.

Compared to a meagre 29.6 per cent achievement in 1973-74, today's 300 per cent achievement speaks volumes about the measures taken by the State Government to strengthen the infrastructure and to create a favourable atmosphere to persuade large numbers of rural population to accept the small family norm.

The achievement rate district-wise represented a healthy competition among the district officials who vied with each other in motivating the people living in remote rural areas. The performance individually in 45 districts with relation to their respective annual targets is very interesting. Two districts have done six times, three districts have done five times, five districts have done four times, five more districts have done three times, seven districts have done two times, and twenty-one districts have completed their annual targets.

Maintaining the present tempo of the campaign, during the current fortnight and in the coming three months, the State Government hopes to achieve much more tangible and substantial results and win the national prize for best performance in family planning. The State also hopes to get a large amount of Central assistance, eight per cent of which is linked to the achievement in family planning under the National Population Policy.

Another remarkable thing that deserves mention is that in the State during the current campaign, the trend towards the costlier tubectomy operation has been reversed with greater preference to cheaper and easier vasectomy operation. As compared to the last year's ratio of 42 per cent vasectomies as against 58 per cent of tubectomies, the State has now achieved the ratio of 92.7 per cent of vasectomies as against 7.3 per cent tubectomies.

The State Government hopes to reach about 2 million couples by March, 1977. The State had been brought to the notice of the Family Planning Bureau and the response from the minority communities was quite encouraging. □

The Fundamental Duties

M. N. MORJE

The chapter on Fundamental Duties has been introduced not to smother rights but to establish democratic balance. Our Constitution was notable for highlighting directive principles along with Fundamental Rights. Neither can bear flower and fruit without performance of the duties.

—Smt. Indira Gandhi

The Concept of duties is very ancient to Indian Civilization. The Fundamental Duties are found in Edicts of Ashoka, Teachings of Bhagwat Geeta, Bible, Quran and in the teachings of great kings and saints. It was suggested by some of the opposition leaders that it would be necessary to provide for the punishmeut in the event of committing breaches of Fundamental Duties. This suggestion could not be accepted as it would have resulted in ignoring the historical, social, religious approach towards the duties. The jurisprudence of any religion has taught us that duties come first and the rights as benefits arising from duties well performed.

WHILE DEFENDING the chapter on Fundamental Duties in Parliament Smt. Indira Gandhi, the Prime Minister of India made the above observation. When the debate on Constitutional Amendement was going on some of the jurists and the Members of the Opposition opposed introduction of chapter on the Fundamental Rights. This was a little surprising because the Constitutions of several nations have incorporated a clause on fundamental duties. What is the nature of such fundamental duties?

A brief study of other nations' constitutions such as those of U.S.S.R., the Republic of China, Federal Republic of Germany, Japan, the Republic of Czechoslovakia, Spain, Venezuela, Italy, Federal Peoples' Republic of Yugoslavia, Republic of Argentina, Finland, Romania, Korea, the Kingdom of Nepal, Republic of Albania, Egypt and the Republic of Guatemala is given.

The founding Fathers of the Constitution did not think it necessary to include a specific chapter on Fundamental Duties, at the time of framing the Constitution, perhaps because they assumed that rights follow obligations of citizens in any civilised society. They thought that every citizen would cherish and follow the noble ideals which inspired our struggle for freedom. They believed that every citizen shall uphold the respect and sovereignty, unity and integrity of India. They thought that it was implicitly binding on every citizen to perform his duties towards his country, overlooking religious, linguistic, regional and sectional diversities. After working the Constitution for 27 years events have proved that statutory emphasis on duties should balance the provision on rights. We cannot think of a citizen, leave alone a society or a nation, where rights are enthroned as sacrosanct and little is done to balance them with duties.

The new chapter in our Constitution enumerates 10 Fundamental Duties. After making a broad comparative study of several Constitutions, it will be found that although some of the duties are found in the other Constitutions, some of the important duties are not included in the constitution of other countries It may be so, because the problems of our country are different. The problems arising out of the religious, linguistic and sectional diversity, composite culture, resulting from different religions prevailing in the country are of a special nature and need to be tackled if we have to produce unity and secularism. India is an economically underdeveloped country and the problem of poverty is closely linked with scientific advancement.

After going through Constitutions of most of the nations I find that many duties prescribed for the citizens are similar or common. Duty to defend the country and undergo military training; duty to work in accordance with his abilities and to contribute by his work to the common weal; duty to respect the religion of others; duty to pay the taxes as provided by law etc. It must be noted that some of the countries including Venezuela have prescribed the duties not only for their citizens but also foreigners living in these countries.

It will be interesting to compare the duties prescribed in these constitutions with those incorporated in our own constitution.

U.S.S.R.

Articles 130 and 131 of the Constitution of U.S.S.R. specifica[lly] refer to fundamental duties

Article 130 states that it is the du[ty] of every citizen of the U.S.S.R. [to] abide by the Constitution to obse[rve] the laws, to maintain labour disc[ip]line, to honestly perform pub[lic] duties and to respect rules of [so]cialist intercourse. Article 131 sta[tes] that it is the duty of every citiz[en] of the U.S.S.R. to safeguard a[nd] fortify public socialist proper[ty] as the sacred and inviolable found[a]tion of the Soviet System, as t[he] source of wealth and might of t[he] country, as the source of prosperi[ty] and culture of all working peop[le]. Persons committing offences agai[nst] public socialist property are enemi[es] of the people.

Peoples' Republic of China

The Constitution of the Peop[les'] Republic of China specifically ref[ers] to the Fundamental Rights a[nd] duties of the citizen in Chapter [...] of the said Constitution. Artic[les] 100 to 103 refer to fundamen[tal] duties of the citizens.

Article 100 states that the citize[ns] of the Peoples' Republic of Chi[na] must abide by the Constitution a[nd] the law, and observe labour disc[ip]line, observe public order and r[es]pect public morality. Article 1[01] states that the public property of [the] Peoples' Republic of China is sac[red] and inviolable. It is the duty [of] every citizen to take care of a[nd] protect the public property. Art[icle] 102 states that the citizens of Peop[les'] Republic of China have the duty [to] pay taxes according to law. Art

---

Mahabaleshwar N. Morje is Advocate, High Court, Bombay and Former Professor, Government Law College, Bombay.

103 states that it is the responsibility of every responsible citizen of the Republic of China to defend the motherland, and that it is the moral duty of the citizen of Peoples, Republic of China to perform military service.

Federal Republic of Germany

Under the Constitution of the Federal Republic of Germany, the following Articles refer to Fundamental Duties.

"Men who have attained the age of eighteen years may be required to serve in the Armed Forces in the Federal Border or guard or in a Civil Defence Organization etc."

Article 14 refers to right of property, right of inheritance, expropriations *Art.* 14(1) refers to property and the right of inheritance guaranteed. Their contents and limits shall be determined by the laws *Art.* 14(2) Property imposes duties. Its use should also serve the public weal.

Expropriation shall be permitted only in the public weal, and the compensation determined by establishing an equitable balance between the public interest of those affected. In case of dispute regarding the amount of compensation recourse may be had to the ordinary courts.

Art. 15 refers to socialisation, Article 18 refers to forfeiture of basic rights, and Art. 19 refers to restriction of basic rights.

Constitution of Japan

Chapter III of the Constutution refers to the Rights and Duties Following are some of the important duties under the constutution of Japan:

Art. 12 states that the freedom and rights guaranteed to the people by this Constitution shall be maintained by the constant endeavour of the people who shall refrain from any abuse of these freedoms and rights and shall always be responsible for utilizing them for the public welfare.

Art. 25 All people shall have the right to maintain the minimum standards of wholesome conduct and culture. In all spheres of life, the State shall use its endeavours for the promotion and extension of social welfare and security and of public health. *Art.* 27 All people shall have the right and the obligation to work. Standards of wages, hours, rest, and other working conditions shall be fixed by law. Children shall not be exploited. *Art* 30 The People shall be liable to taxation as provided by law.

Republic of Czechoslovak

Under the Czechoslovak Constitution, following are some of the important duties.

Sec. 30 (1) It is the duty of every citizen to be loyal to the Czechoslovak Republic, to uphold the Constitution and the laws and in all his actions to be sensible of the interests of the State.

(2) In particular it is the patriotic duty of every citizen to assist in the maintenance and furtherance of the national property and to guard against its being diminished or damaged.

Sec. 31 It is the duty of citizen to discharge all public functions to which they have been called by the people conscientiously and honestly in the spirit of the People's Democratic Order *Sec.* 32 It is the duty of every citizen to work in accordance with his abilities and to contribute by his work to the common weal *Sec* 33 Taxes and public duties may be levied only on the basis of the law. Likewise the public authority may demand personal services only on the basis of the law *Sec* 34 (1) The defence of the State and of the People's Democratic Order is the supreme duty of every citizen. Service in the People's democratic army of the Czechoslovak Republic is the supreme honour for every citizen

(2) It is the duty of every citizen to undergo military training to take part in military service, and to obey any call for the defence of the State.

(3) For the purpose of the defence of the State and for the preparation of such defence, cooperation and material contributions may be demanded from, and restrictions and material services imposed upon, every one.

(4) Public authorities and executive offices shall in the exercise of their official function, by virtue of their authority take care also of the interests of the defence of the State.

Sec. 36 – (1) It is the duty of all public authorities to act in the discharge of their office or duty in accordance with the law and with the principles of the People's Democratic Order.

(2) If any public functionary offends against this duty he shall be liable to punishment according to law.

Spain

Following are the duties under the Spanish Constitutions:

Art. 2 – Spaniards owe faithful service to their country, loyalty to the Chief of State and obedience to its laws *Art.* 6 – The profession and practice of the Catholic religion, which is that of the Spanish State, will enjoy official protection.

Nobody will be molested because of his religious beliefs or the private exercise of his cult. No external ceremonies or manifestations will be permitted except those of the Catholic religion. *Art.* 7 – It is a title of honour for Spaniards to serve in the armed force of their country

There are other duties such as contribution to the maintenance of charges, duty to occupy any socially useful activities etc.

Venezuela

Art. 20 - states that all Venezuelans have the duty to defend their country, to fulfill and obey the Constitution and the laws of the Republic, as well as the decrees, orders, and resolutions which, in accordance with their powers, the public authorities may dictate They shall not serve against Venezuela in any event, or against her allies in case of armed international conflict, and, should they do so, they shall be considered as traitors to the Nation.

All foreigners are obliged to obey the laws in the same manner required of Venezuelans while they reside in the territory of the Republic.

Art. 21 – states that without prejudice to the previous international agreements, all foreigners in Venezuela shall have the duties and the rights which this Constitution and the laws grant them, however, neither their rights nor their duties can be greater than those of Venezuelans.

Republic of Italy

Work is both a duty and a right Every individual must contribute to the progress of society by means of work. It is the duty of the State to obtain the incorporation of Italians into the national life.

Some of the important duties:

Art. 2 – states that the Republic acknowledges and guarantees the inviolable rights of man both as an individual and in the social organisations where his personality is developed and requires the fulfilment of the essential duties of political, economic, and social solidarity. *Art.* 4 – states that the Republic recognizes to all citizens the right of work and promotes conditions to

render this right effectively.

Each citizen has the duty to exercise, in conformity with his own ability and choice, an activity or function contributing to the material or spiritual development of society.

There are other duties such as the duty of the parents to support, teach and educate their children, even if born out of wedlock, to defend the country etc.

Republic of Yugoslavia

Art. 22 – of the Constitution states that the citizens of the Federal Peoplels Republic of Yugoslavia are bound to comply with the Constitution and laws. *Art.* 32 – It is the duty of every citizen to work according to his abilities; he who does not contribute to the community cannot expect to receive from it.

Art. 33 – All public offices are equally accessible to all citizens in accordance with the conditions of the law.

It is the duty of every citizen to perform conscientiously the public duties to which he has been elected or which are entrusted to him. *Art.* 34 – The defence of the fatherland is the supreme duty and honour of every citizen.

High treason is the greatest crime towards the people Military service is universal for all citizens There are also other important duties such as payment of taxes and participation of the people and the workers' in nation-building tasks

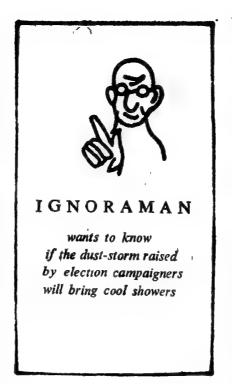
The Republic of Argentina

Art 32 – Every Argentina citizen is obliged to arm himself in defence of the country and of this Constitution, in accordance with whatever laws Congress shall enact for the purpose and the decrees of the national executive power

Art 33 – Treason against the Nation shall consist only in taking up arms against her, or in aligning with her enemies, giving them aid and comfort. Congress shall declare, by a special law, the punishment of his crime, but the penalty for treason shall apply only to the offender and no infamy therefrom shall affect his relatives, regardless of the degree of relationship.

Finland

Art. 75 – Every Finnish citizen must take part in the defence of the country or assist therein as prescribed by law.

Every conscript, unless he otherwise desires, shall if possible be enrolled in a military unit the members of which speak his own mother tongue (Finnish or Swedish), and shall in such unit receive his instruction in that language. Finnish shall be the language of command of the armed force.


Peoples Republic of Romania

The defence of their country is a duty of honour for all citizens. Military service is obligatory for all citizens according to the law.

High treason – violating the oath of allegiance, entering the service of the enemy, impairing the military power of the State – constitutes the gravest crime against the people and is punishable with all the severity of the law.

The Republic of Korea

Art. 17 – States that all citizens shall have the right and duty to work. The standards of the conditions of labour shall be determined by law. Special protection shall be extended to the labour of women and children *Art.* 29 – All citizens shall have the duty to pay taxes in accordance with the provisions of law. *Art* 30 – All citizens have the duty to defend the national territory in accordance with the provisions of law.

There are other countries such as Nepal, the People's Republic of Albania, Egypt, Republic of Guatemala, who have included similar fundamental duties in their Constitution. □

New Banking Policy

contd. from Page 17

Programme and *Retail Banking*. The banker today must have knowledge, imagination, sound thinking, initiative and a spirit of heroism.

15 *Agents of Change* · Entire fabric of banking industry is on the threshold of change. Banks have to manage for growth to ensure growth with social justice. It is no wonder therefore that management of change, particularly to bring about desired social change is a really challenging task, the success of which largely depends upon the attitude of employees. Banks have been called upon to undertake an accelerated expansion of their activities, both geographically and functionally. These changes have altered the very role of banking industry. The concern of the industry has been as to how best to organize and perform varied tasks and how best to render myriad services to its over increasing clientele.

No doubt there is a gap between expectations and performance. People expect miracles from the banking system. This is partly due to the misinterpretation of the role of banks by public There is need for educating public opinion on right lines. Banks need not be dismayed by brickbats—none the less be swayed by pressures from different quarters

To conclude it may not be out of place to quote the thought provoking message of Smt. Indira Gandhi emphasising the role of bankers as "*Agents of Change*".

"OUR BANKS MUST ADOPT A NEW ATTITUDE, BEFRIENDING THE POOR AND TAKING THE BENEFITS OF PROGRESS TO THE RURAL AREAS. I HOPE THAT EMPLOYEES OF NATIONALISED BANKS WILL AT ALL TIMES SHOW, COURTESY AND COMPETENCE, AND BECOME AGENTS OF CHANGE AND DEVELOPMENT. □

IN SHEEP'S CLOTHING

ERNEST FEDER

Capital invested by transnationals to intensify land use leads to the impoverishment of developing countries through the retransfer of their resources.

THE ELIMINATION of the remnants of peasant agriculture and the depletion of resources at terrifying speed with unpredictable results for future food supplies—that is the balance sheet I draw up for the overseas activities of the transnational corporations of the industrial nations operating in Third World agricultures.

My balance sheet does not give with how agribusiness operating on a worldwide scale sees its function with respect to "development". A few years ago, public opinion was shocked when a president of General Motors declared that what is good for his corporation is food for the United States. Today the same argument is put forward by agribusiness. Henry J. Heinz II of the giant food concern Heinz Co., chairman of the U.S Agribusiness Council (a non-profit organisation "dedicated to bringing the resources and capabilities of agribusiness firms to bear on economic development"), wrote that agribusiness "attempts to wed developing country needs to agribusiness interests and capabilities."[1] It pretends that it alone is capable, qualified and has sufficient expertise to develop Third World agricultures.[2] But what are "developing country needs"? The theory that the welfare of society is identifiable with the profit-earning capacity and power of business firms, or that the benefits of economic activities accruing to corporations will trickle down to the underprivileged masses of the Third World is totally discredited by the historical processes of capitalist expansion. Even McNamara, the world's foremost banker and financier, conceded in Nairobi in 1973 that "the data suggest that the decade of rapid growth has been accompanied by greater maldistribution of income in many developing countries and that the problem is not severe in the countryside." However, he failed to mention what we all know; during this same decade, the growth and profits of international agribusiness firms were at record levels. It is false that only agribusiness is capable of helping developing agricultures. Socialist agricultures with growth rates, production diversification, full employment, higher incomes and security for the peasants and greatly improved diets, all bordering on the spectacular, show that agribusiness capitalist style is not needed.

Ernest Feder has been a professor at the Institute of Social Studies, The Hague, since 1973. Before that, he worked for ten years with ECLA and FAO in Latin America and Sri Lanka. He is also the author of the Rape of the Peasantry, among other works.

The Modernization Process

My dismal balance sheet is the reflection of an apparently highly paradoxical process. A chronic lack of investments and a process of systematic decapitalization causing continuously deteriorating production and diminishing food supplies, offset only partially by the expansion of the farming area, have long afflicted developing agricultures. New investments and technological improvements were urgently needed but could not be expected under their obnoxious land tenure conditions. Since the mid-1960s, an enormous and growing amount of capital and technology has been transferred from the industrial countries. It results in a process of decapitalization that exceeds in extent and speed anything the world has seen. The apparent paradox-needed investments undertaken by transnational corporations and supporting agencies to intensify land uses causing retransfers of resources from developing agricultures to industrial nations greatly in excess of investments—resolves itself easily enough when one knows how agribusiness functions.

Of course agribusiness includes more than private firms engaged in the production, processing, marketing or exporting of agricultural products or in the production, assembly, distribution or imports of inputs. It includes also the supporting activities of national, bilateral, public or private international and multinational financial and technical development agencies directed largely (at times exclusively) towards strengthening the infra-and superstructure for the effective and profitable operations of the former.

The transfer of capital and technology to Third World agricultures goes under the agribusiness title "modernization". The first such large-scale modernization scheme was the green revolution. There is no need to go into this much discussed programme whose alleged purpose was to eradicate hunger, except to point out that what agronomists called naively the "seed-fertilizer package" was in reality the first hard-boiled attempt to expand capitalist agriculture in the Third World's latifundium sector; and that the subsidized worldwide dissemination of "miracle" seeds made no dent whatever in the hungry people's diet. But the predictable failure of miracle seeds to "do their job" of wiping out hunger was anything but a deterrent for increasing agribusiness investments. This alone makes it abundantly clear that the elimination of hunger could not have been the objective. It was not the new seeds that were miraculous, but the extent and speed with which agribusiness entered the food business in the Third World. The green revolution was followed by the modernization of many other agricultural sectors, quite independently of any miracle seeds.

What are the parameters of the capitalist-style modernization process?

Capital investments are now made in farmland itself. They arrive in the form of fixed investments (land purchases, leases, concessions, etc.,)

and allow foreign investors control over the land and its exploitation. (Not all these transactions are traceable because of the use of "strawmen" to hide ownership). Fixed capital allows control overland also in less direct form. One is the so-called production contract system, about which more will be said below; another is the investments made by development agencies in agricultural projects, which allow these agencies some control over land by controlling the performance of the projects. The land-now under direct and indirect control by foreigners is very substantial and steadily increasing, particularly in some "pet" countries, such as Brazil. In addition, capital arrives as operating funds. They usually exceed fixed investments by a large margin, depending on the type of commodity involved. Operating capital puts the finishing touches on control because all production and some marketing phases are determined by it.

Control at all Levels

In addition, fixed and operating capital is transferred into agriculture-related industries and all kinds of necessary and (from the point of view of the Third World) superflous services to control the processing and distribution of the product and the production and distribution of inputs They significantly exceed investments at the farmslevels and tend to snowball, in part because they involve relatively costly constructions (usually of excess capacity because this is a very effective competitive device) and large and generally imported equipment and also because of the growing need to service output and sale of inputs and to repatriate profits. There are quite a few cases where such investments represent, from the point of view of the developing countries, an extraordinary waste of resources Take for example a plant that operates only a few months out of the year to process a highly seasonal product when, through proper planning for diversified production, the investment could serve the year round. Obviously, this is not of particular concern to overseas investors since their investments are amortized in most cases in record time.

The inherent logic of these capital flows is that transfers to one level always accompany, as if by necessity, transfers to other levels. Not infrequently, the source of these capitals is the same, although the flows are of course not unidirectional. Only transfers to all levels provide overseas investors singly or as a group with full control over phases of activities in the modernized sectors of Third World agriculture, and control is one of the objectives Control is a prerequisite for deciding what, where, when, how and how much to produce; and whether, how, when and to what markets to "distribute the output; and how to assure and maximize the repatriation of profits. The more intensive modernization, the greater the control at all levels. There are innumerable and rapidly growing instances of modernized sectors all over the Third World where production and distribution are totally managed by foreign capitalists, and where therefore the decision-making power of local capitalists or governments is reduced to practically zero. Thus the modernized sectors become mere extensions of the agricultures of the industrial countries—new enclaves in the Third World

Transfers of capital are practically always accompanied by technology transfers (including their servicing). Sometimes capital precedes, sometimes it follows technonology A sequential capital-technological package is characteristic of modernization carried out under the aegis of multinationals and allied agencies. So is the sequential technological package because it is part of the inherent logic of the system that one technology transfer generates further transfers. Often this is due to the inherent nature of the technologies. The use for example of a new seed variety that performs best under irrigation must—to be profitable—be followed by irrigation facilities and equipment; larger harvests call for mechanized equipment, and so forth. At other times, it is simply the result of sales pressure of producers, owners or dealers of technologies or extension agents trained in agricultural colleges of industrial nations. It is precisely the combined assault by capital technology that explains the severe and adverse economic, social and political impact of capitalist style modernization on the developing countries.

The Search for Profits

How to explain the forces underlying these processes, which are likely to be highly chaotic and inimical to alround development? Although developing countries have an interest in improving agricultural performance for a variety of reasons (substitute food imports, increase foreign exchange earnings through more exports, etc). the initiative for modernization stems from the capitalists of industrial countries. It is notorious that in the initial stages of the green revolution, for example, modernization had to be practically forced on large landholders and sometimes on governments—by cajoling the former with enormous subsidies and the latter through the promise of financial assistance. Now overseas investors tend to run their own ventures as fully as possible. The major incentive is the search for profits. (Another is the political element; counter-reform) Obviously, input sales are always profitable. But, in contrast to widespread opinion, agricultural ventures too are extremely profitable and even generate superprofits,* most particularly when they are run with full control over all phases beginning from the choice of inputs through the repatriation of profits. A profitable overseas operation, once started, generates enormous pressures for expansion and diversification. Each transfer of capital and technology is a source of new profits Superprofits are the consequence of an obvious—but by the multinationals, never admitted—fact, inputs made available locally are low or superlow cost items In addition, the modernizing sectors monopolize the best land, with actual or potential high yields. And we cannot overload the fact that overseas capital is highly mobile; if production costs threaten to rise, investors can easily pull up stakes and move to new areas or countries where costs are lower, like the notorious "runaway" industries—even considering that it takes more time to pull up stakes in the case of permanent plantations. The very threat by a large international food firm that it would move out is usually enough to obtain concessions so that low costs and optimum profit repatrations can be maintained.

The apostles of agribusiness claim that they are uniquely qualified to transfer to local entrepreneurs and producers the best know how available to them. One said textually. "When a grower signs-a production contract with an international processing-plant he has an ally in his efforts to use the best farm technology"*. The implication is that, as agents to "wed developing country needs to agribusiness interests and capabilities", transnational agribusiness firms would, in due course, transfer the entire bag of production,

processing and marketing knowhow to the developing producers and entrepreneurs; the latter would emerge from their state of underdevelopment and begin making their own decisions with the bag of tools acquired.

This is a far cry from what actually happens. First, agribusiness regards its role of innovator as a permanent function. The foreign investor's and technology transferrers' last intention is to give up this role and attitude incompatible with the proclaimed desire to help developing countries emerge from their unfortunate status. Transfer of knowhow is therefore a transfer *sui generis* and one might even argue that it is not a transfer at all in the sense of the word. Secondly, international agribusiness firms do not always transfer, or transfer only a portion of the best farm processing or other technology, and they practically never transfer marketing knowhow. The quantity or quality of the technology is likely to be decided by three overriding factors the existence or search for monopoly power, the need to minimize costs and maximize repatriation of profits and, at times, the need to face political issues. These factors operate singly or in combination, although perhaps not in the same direction. Agribusiness firms find themselves by and large in an unusual position because they practically always occupy a monopoly position or achieve it quickly by driving out local ventures. If they already have a monopoly status, there is no overriding need to use the best or all the best knowhow. This is pure and simple textbook economics. To achieve it, they may use it, but deny it to competitors.

Unequal Exchange

Equally, if not more, important is the cost factor. Here again we must keep in mind the unusual condition encountered: the abundance and even overabundance of cheap land, water and labour. These make it unnecessary and in many instances profitable to transfer the best or all the knowhow which, one must insist, is always in the bag of the transferrable knowhow of international agribusiness firms. Only the knowhow that will not unduly raise costs and reduce the repatriation of profits will be transferred. This is not a very original discovery, but few realize the consequences it has on the use of local resources and particularly on people.

Take an international lumber company from a country with a long tradition of high-level forest management, including systematic reforestation, having a concession in a Third World forest in which many communities make their living from exploiting the timber. There is an abundant labour force, and increased forest exploitation could offer many new employment opportunities. But what happens? The company brings in an enormous pack of the most modern equipment sufficient to cut trees at speeds never seen before in the area and haul it out with modern transportation. Here the overwhelming need is to keep the local force with rights to the land and income from it away —usually forcibly and ruthlessly. The company destroys the forest and the people, but undertakes no reforestation, since this would increase the costs of operation and no one obliges it to do so. The governments are powerless or are guided by the same shortsighted profit motive as the multinational destroyers of forests or have themselves no resources to undertake the reforestation at speeds equivalent to the destruction.

Once the forest is gone, the company will move to the next forest. This process now occurs on a vast scale throughout the Third World. The same also occurs on an immense scale in the livestock industry with respect to grazing lands.

Or take an international fruit or vegetable processing plant, operating in a fertile irrigated valley. It employs the production contract system much vaunted by agribusiness, whereby the plant "exchanges" the growers' output in return for credit and inputs. If exchange there is, it is highly unequal: credit and inputs tie producers to the plant in exactly the same manner as credit and company stores tie rural labour to the employer-patron The plant fulfils the function of a seller of (or agent for) inputs on which it makes a handsome profit. This is incompatible with its proclaimed role of "ally of the growers in their efforts to use the best farm technology." The search for profits is incompatible with serving producers with inputs best adapted to their needs rather than those of the agribusiness firms, as widespread complaints of producers prove. In the process, two developments take place. Land and water are exploited maximally without regard to fertility, soil infestation, good texture or proper drainage. That is not the plant's worry, it needs to make no contribution whatever to maintain the capital base of its operation; it will quickly shift its operation to new cheap and abundant fertile land where the process starts all over again.

At the same time, the plant destroys the remnants of peasant agriculture, favouring large and gradually eliminating small producers in obedience to the (false) theory that large private holdings are synonymous with efficient operations. The already significant socio-economic inequalities are aggravated; landlessness and poverty increase. If a contribution is made to rural or factory employment, it will be at rock-bottom wage levels and seasonal—the least desirable employment, and the most exploitative.

No Percentage

In their inordinate rush to "clean out" deliberately the best resources as long as the going is good and earn the super profits not earnable any more in the industrial countries, international concerns accomplish what the traditional estate owners in the developing agricultures were unable to do; ruin agricultural capabilities not within five, eight or twelve generations, but within one or two. Production in the modernized sectors will undoubtedly increase—until all the best resources have been exhausted—but not for the benefit of the rapidly increasing hungry people. As the green revolution proves, for agribusiness firms with monopoly over food and fibre there is, in the prevailing system, no percentage but in selling to those who have purchasing power. And to round off the dismal picture: modernization is accompanied locally by highly unsettling economic conditions of which erratic markets are the most outstanding, and by the inability of local governments to execute plans to preserve the basis of the livelihood of future Third World generations. The more resources are destroyed, the greater the future dependence on industrial countries. □

A VILLAGE COUNCIL—10TH CENTURY

THE REMARKABLE continuity of the cultural traditions and social institutions among Indians despite vicissitudes in the political fortunes of great ruling dynasties is to be traced to the highly organised community life in every village. This has been generally true for all ages not excluding the periods when Muslim Kings were in power. Even in its truncated form after the British came with many of its ancient privileges curtailed if not deprived, the village *panchayat* continued to play role in the maintenance of public utilities such as tanks, wells and roads and traditional disciplines within and between the castes.

In ancient days, however, every village council (by whatever name it was called such as *Sabha, Mahasabha, Panchayat* etc.) was a representative body to which men of proved integrity, wisdom and sense of service were selected. In South India in particular and more especially the Tamil country, these village councils played a uniformly significant role since the third century B.C. They were, as it were, the grass roots of public administration and no king, however, powerful or autocratic dared interfere in their functioning except when such interference manifestly strengthened their working.

The Sabha performed a variety of functions concerning the economic, social and cultural life of the community. It maintained records of properties, public and private; administered endowments for upkeep of tanks, wells, hospitals and schools; it regulated services in the temples; it functioned as a bank and advanced money to cultivators; maintained village roads; arbitrated over disputes; regulated retail trade; imposed and collected taxes; and occasionally even sat in judgement over what would now be considered as private morals. The effective functioning of these councils naturally depended on the personal integrity of those who composed them. Hence very stringent qualifications were prescribed before a person was elected to the Sabha.

The following inscription of the 10th century from Uttaramerur (150 miles south-west of Madras) is one of the most unique documents of its kind and gives a picture of elections to a village council in the Chola Kingdom. The underlying principle was not the adults' vote but the proven integrity of the candidate.

A Page from History

The Uttaramerur Inscription

Hail! Prosperity! On the sixteenth day of the fourteenth year of king Parakesarivarman* who captured Madura—we, the members of the Sabha of Uttarameru-caturvedimangalam in its own subdivision (*kuru*) of Kaliyurkottam,—a gracious letter of His Majesty, our Lord Sri Viranarayana sri Parantakadeva Sri Parakesarivarma having been received and shown to us, and in accordance with ((that) letter Karanjai Kondaya Kramavittabhattan *alias* Somasiperuman of Sri Vanganagar in Purangarambainadu of the Solanadu, sitting (with us) by order, — (we) made the following settlement with a view to appointing as *variyam* (committees), every year from this year onwards, (the following) (viz), the ***annual committee, garden committee*** and ***tank committee.***

There being thirty *kudumbus* (wards), in (each of these) thirty wards, the people of the ward concerned shall assemble, and shall write on pot-tickets (the names of) those who own more than one-fourth *nilam* of taxable land, reside in houses built on their own sites, are below seventy and above thirty-five years of age, know the *Mantrabrahmana* and possess experience of teaching it.

Though owning only an eight o[f] a nilam, if a person is competen[t] in one Veda and possesses experienc[e] of expounding one of the four bhasy[as] as he shall also have his nam[e] written on the pot-ticket and pu[t] (into the pot).

Even among these, only person[s] who are proficient in (general) affai[rs] and conform to proper condu[ct] (*assaram*) shall be taken. Those wh[o] have material and spiritual purit[y] and have not done *variyam* th[e] side of three years shall be chosen.

Anyone who has done any *variya[m]* (before) and failed to show account[s] and his relatives as specified herei[n] shall not have their names writte[n] on pot-tickets and put (into the po[t]) —(viz.) the sons of the younger an[d] elder sisters of his mother; the so[ns] of his paternal aunt and matern[al] uncle; the brother of his father; h[is] own brother; his father-in-law, the brother of his wife; the husban[d] of his sister; the sons of his siste[r]; the son-in-law who has married h[is] daughter; his father and his son.

Those against whom incest or th[e] first four of the five great sins a[re] recorded and all their relations a[s] specified herein before shall not als[o] have their names written on po[t]-tickets and put (into the pot).

Those who have fallen by asso-ciation (with sinners) shall n[ot] have their names written on po[t]-tickets till after they perform e[x]-piation.

Those who are violent shall al[so] not have their names written o[n] pot-tickets and put (into the po[t]). Those who have stolen others' pr[o]-perty shall not also have their nam[es] written on pot-tickets and put (in[to] the pot).

Those who, after partaking of a[ny] forbidden dish, have become pu[re] by performing the ghee expiati[on] (?), shall not also, to the end of th[eir] lives, have their names writt[en] on pot-tickets for the committe[es] to be put (into the pot).

Those who have become pu[re] after performing expiation for si[n], those who have become pure af[ter] performing expiation for havi[ng] turned enemies of the village (*gram[a]-kantaka*), and those who have [be]-come pure after performing exp[ia]-tion for incest—all these pers[ons] shall not, to the end of their liv[es], have their names written on p[ot]-tickets for committees to be [put] (into the pot).

---

*King Parantaka I

Excluding all these persons specified above, names shall be written for pot-tickets in all the thirty wards; and in these twelve *seris*, separate covering tickets (*vayaolai*) shall be attached for each separate ward, and (the tickets of) the thirty wards shall be separately bundled and put (into the pot).

When pot-tickets are (to be drawn, the members of the *Mahasabha*, young and old, shall be assembled at a full meating and the temple prisets (*nambimar*) who happen to be in town on the day shall, without any conception, be caused to be seated in the inner *mandapa* (pavilion) in the *Mahasabha*; among the temple priests, an old priest shall stand up and, looking upwards, shall hold the pot so as to be seen by all people, (the bundle of) one ward shall be caused to be taken out by a boy who cannot see the difference (between things) even by day, and it shall be put into another pot and shaken, and one ticket shall be drawn out of that pot and placed in the hands of the arbitrator (*madhyasta*)

When the *madhyastha* receives the ticket thus given, he shall receive it in the palm of his hand with his five figures spread out. And he shall read (out) the ticket he has so received. The ticket so read shall be read also by all the temple priests in the inner pavilion The name so read shall be written down this manner, one name shall be obtained from each of the thirty wards

Out of the thirty names so got, those who have served on the garden committee and the tank committee and those who are advanced in earning or in age shall form the annual committee.

Of the rest, twelve shall form the garden committee. The remaining six shall form the tank committee. These two committees shall be formed by showing the *kurai* (?) The members of the three kinds of committees that perform *variyam* shall do (their duties) for three hundred and sixty days and then retire.

Anyone who is found guilty among those who are serving on the committee shall be removed (forthwith).

(For) the committees to be appointed after the retirement of these, the members (*variyar*) who super intend charities in the twelve *seris* shall themselves cause the the assembly to be convened by the *madhyasthas*. The committees shall be appointed only by drawing pot-tickets in accordance with this deed of settlement.

For the *pancavara* committee and the gold committee, names shall be written for pot-tickets in all the thirty wards, and thirty bundles with covering tickets shall be put in, and thirty tifkets drawn, from which again twelve names shall be drawn.

Of these twelve so drawn, six shall form the gold committee, and six the *pancavara* committee.

When drawing pot-tickets in the following year for these committees, the karai shall be drawn only among the wards that remain after concluding those that served on the committees before (on the preceding year).

Those who rode on assess, and those who forged documents shall not have their names written on pot-tickets to be put (into the pot).

Among *madhyasthas*, only a person possessing material purity (arthasaucam or free from charges of bribery or cheating) shall write the accounts.

Until after a person who maintained accounts submits accounts along with the accounts-committee of the *Sabha* and is declared pure, he shall not enter on (maintaining) other accounts

A person who has been maintaining accounts shall himself submit his accounts; other accountants shall not enter and close them.

We, the members of the assembly of Uttarameru-caturvedimangalam —having been shown the gracious royal letter received from the lord of the gods, the emperor, the lover of sholars, the wrestler with elephants, the crest-jewel among heroes, the emulator of the Kalpeka, Sri Parakesarivarma; Karanjai Kondayakarama-vitta Bhatta ;*alias* Sonsasiperuman of Sri Vanganagar in Purangarembei-nadu of the Solanadu, sitting with us by order and causing us to make this settlement (we) made this settlement for the prosperity of our village and for the destruction of the wicked and the increase of the rest, viz, that in this manner, from this year as long as the sun and the moon last, we shall always appoint only pot-ticket-committees.

I, the madhyastha, Kadadippottan Sivakkuri Rajamallamangalapiryan, wrote this settlement in this wise to the doctation of the members (perumakkai) sitting in the assembly (kuriyullirundu).

Taken from Studies in Chola History and Administration by K.A. Nilakantha Sastry — University of Madras 1932.

A Revolution Without Tears

Economic Revolution in India *Edited by S.D Punekar and Others; Himalaya Publishing House, Bombay,* 1977, *Pages xvi+P587; Price Rs* 55.

THE FIRST half of the year 1975 was marked both by intense political turmoil and acute economic unrest To counteract this, the President of India declared, on June 26 Emergency on the Political front, whereas the Prime Minister announced on July 1 the 20 Point Programme for Economic Discipline. Both the political and economic declarations have brought on the whole some salutary effect in creating a congenial climate to enable the Government of India to announce the Lok Sabha elections in March 1977

During the last year and a half, the 20 Point Programme has received considerable publicity. The bold and imaginative measures suggested to solve the numerous economic problems facing the country, the immense economic sweep of the Programme itself and the various types of instruments, legal or otherwise, created or activated for adequate implementation of the Programme make it desirable to have a deep study of the economic problems involved and of the measures taken or proposed to be taken towards their solution The book under review seems to be the first serious attempt to fill this gap

The 20 Point Economic Programme was followed within a few months by the 5 Point Social Programme of the Youth Congress. The Indian National Congress and subsequently the Government accepted both the programmes for the socio-economic development of the nation. It is difficult to demarcate the social and the economic elements separately in both the programmes. The 20 Point Programme, for example. is not merely economic, it has its social aspects too For example, stabilisation of the price line has both economic and social effects Similarly, the various points like the land for the landless, rural housing, abolition of bondage, minimum wages in agriculture, socialisation of urban land and action against social enemies are meant not only for betterment of economic conditions but also for elimination of social exploitation and protection of the downtrodden. Though the 5 Point Programme is primarily of social importance, points relating to family planning, literacy, anti-dowry and removal of caste barriers have some impact on the economic development of the country

Books

The book is a useful publication of topical importance, giving up-to-date facts and figures on the 25 points, which, if properly implemented, would usher in a new era of socio-economic development The 42 articles, contributed by 38 experts, present a panoramic view of important social and economic problems, which demand urgent attention Point by point, each topic has been discussed, beginning with a short history of the problem involved, stating the proposal made by the Programme regarding the solution to the problem, explaining the existing state of progress with facts and figures, indicating the nature of changes being brought about by the implementation of the Programme and evaluating the work done so far: suggestions have also been made for better and speedier implementation of the Programme. In short, the book is a critical evaluation of the 20 + 5 points of the two programmes A short article on "National Fitness". published at the end, may be considered as the 26th point.

Any book on a dynamic field, as envisaged by the two programmes, cannot be a final word. because so many changes and that too at a rapid speed are being brought about by the implementation of the various points. To keep up with the times the book would have to be revised in subsequent editions At present, the data are up to the end of October 1976 The book would also require modifications after considering the viewpoints of constructive critics

The Publishers and the Editors of this volume deserve thanks for completing a great task, whose results would be of immense utility to all those interested in the social and economic development of India

(Miss) Kalpana Vaidya

Employment-Oriented Growth

Industrialisation and Employment *by Dr M.M Mehta; Popular Prakashan Bombay* 1976: *Pages* 128; *Rs,* 40/-

WHILE ADMITTING that industrialization is sine qua non of modern society, Gandhiji imposed certain formidable conditions on it. And one of them was that industrialization should not crunch employment opportunities This is the theme of Dr Mehta's study It consists of four chapters which together examine the extent and nature of the impact of industrialization on employment with special reference to the underdeveloped and developing countries of Asia and the Far East

The first chapter analyses global trends in the growth of manufacturing output and employment It is revealed that manufacturing output has grown at a faster pace than manufacturing employment. And that the shift in the pattern of output and employment from light industries in favour of heavy manufacturing industries has proved to be detrimental to employment opportunities Being capital intensive in character the heavy industries lack the capacity to generate more employment The author points out that these trends are reflected more prominently in the countries of Asian region, and is lihely to exert a decisive influence on the current and future size, rate and growth of industrial employment

An exploratory attempt has been made in the next two chapters to examine the prevailing structure in manufacturing employment in various countries of ECAFE (now ESCAP) region and the relative efficiency of labour and capital-intensive industries in terms of costs, productivity, profits etc. The study has found that in those countries which are still in the embryonic stages of industrialisation viz., Burma

Indonesia, Thailand, the light industries account for nearly 80 per cent of manufacturing employment. In an industrially advanced country like Japan the share of the different industries in manufacturing employment is more evenly spread. The study also identifies some of the labour-intensive industries having the potential of securing reinforceable increases in output and employment. The concepts of 'labour-intensity' and 'capital-intensity' has been touched upon

It has been argued that labour-intensive or capital light production is incompatible with economic growth and profitability and that capital-intensive production could promote a more rapid rate of growth, larger output and employment. However, the author says that the co-existence of labour intensive with capital-intensive industries and earning profit adequate to keep them in business is indicative of the advantages of a labour-intensive industry. Unfortunately this vulnerable hypothesis is not elaborated further

The study envisages for the developing countries, with deficiency of capital and abundant manpower, a pattern of industrialisation that would provide more employment, "and by reducing the needs of supporting the unemployed may increase saving through external economy"

After diagnosis comes the remedy in the final chapter where the blueprint of an employment-oriented industrial strategy is put forward It includes the following: -

(a) Maximum utilization of production capacity in manufacturing industries.
(b) Reduction of capital-intensive industries through selection of industries offering the largest employment potential per unit of capital invested.
(c) Choice of production techniques which are capital saving and labour-intensive in character, and lastly
(d) promotion of small scale and cottage industries that could be dispersed in rural areas.

Entrepreneurs in the developing countries of Asia will find useful suggestions about the type of industries that could be set up (according to the natural resource endowments) in rural areas which are the roots of unemployment.

Nearly half the book is filled up with statistical data which, though laboriously collected, comes in the way of a more vigorous empirical approach to the problem of the impact of industrialisation on employment

—**R. Muralidhar**

Science and Development

Science and Development *by B K Nayar; Orient Longman; Pages 226, Price Rs 30.*

THIS COMPILATION of essays on science and development is dedicated to Mr C. Subramaniam on the occasion of his 65th Birthday As Minister-in-Charge of Steel and Heavy Industries, he took steps for improving the working of several units. However, his name is also connected with the introduction of high-yielding varieties of seeds which led to the green revolution Dr Norman E Borlaug, progenitor of the Green Revolution wrote, "The vision and influence of Mr. Subramaniam in bringing about agricultural change, and in the very necessary political decisions needed to make the new approach effective should never be underemphasised"

This collection of Papers by several experts in their fields present a vivid and critical picture of development in key areas of science, technology and education. The subjects that have been discussed are high-yielding crop varieties, Science and Technology Plan, Nuclear Energy, Problems of Education, and India's aquatic, other natural resources, etc.

The opening essay, "High-yielding crop varieties" by M.S. Swaminathan makes thought-provoking reading. The author rightly says that increasing involvement of the farming community in preparation and implementation of action plans may alone help to convert a small government programme into a mass movement Some essays fail to arouse the reader's interest. For example Rahman's discussion of "General Value System and Culture Manifestation" tends to be too abstract and confusing

"Some Problems on Education" by D S Kothari makes interesting reading Dr Kothari rightly says, "Knowledge has placed in man's hands unprecedented power. But what about wisdom? In the nuclear age, there is and can be no way to resolve conflicts, big or small, national or international, except on the basis of knowledge, cooperation, and understanding The future belongs to knowledge and Ahimsa".

Other interesting Papers are Atomic Energy by H.N. Sethna, Consequences of the Import of Technology by Nag Chaudari, Natural resources and their Exploitation by Hari Narain. Incidentally the latter is an extremely well written piece. According to Hari Narain, "With greater exploitation and management efforts employing larger number of our qualified, unemployed graduates, conservation policies in the light of experiences of advanced countries, appropriate technologies to suit our resources and for recycling and substitution, India can march ahead with greater confidence to meet the challenges of the future".

Although some of the articles are well written, the book leaves the reader disappointed The book would have gained immensely had there been an introduction at the beginning on the role of science and development by a famous writer. Inclusion of subjects like intermediate technology, role of mass media in disseminating scientific knowledge and information, higher education, would have added to the value of the book. Viewed in this light, I think the editor has lost a good opportunity of producing a book of interest and relevance.

—**Nitish S. Rele**

Development Notes

New Delhi. In-plant training is also provided to the entrepreneurs at various Government Quality Marking Centres and Industrial Development Centres.

The educated unemployed are granted major loans by financial institutions of the State Government. In addition, 10 per cent of the cost of the project is provided as seed-money at the rate of 4 per cent per annum interest.

Paper from Indigenous Materials

Some National Laboratories of the Council of Scientific and Industrial Research have developed the know-how for obtaining industrial grade pulp and paper from Indian plants which promise to enable India produce all the industrial grade pulp and paper she needs.

Pulp from plant cellulose is the basic raw material for synthetic fibres, rayon and cellophane industry

The present production of viscose yarn and staple fibre in India is about 110,000 tonnes per annum The current production of the pulp is, however, 55 to 60 thousand tonnes annually. Nearly 60 per cent of requirement of pulp is still met by imports

The National Chemical Laboratory, Poona has developed processes for producing rayon grade pulp from eucalyptus, and from three hard wood trees of Bastar forest. The know-how for rayon grade pulp from eucalyptus chips has been tried out on pilot plant scale and the cost comes to about Rs. 1746 per tonne

Similarly, various kinds of papers whose manufacturing technology is a closely guarded secret of paper manufacturers in foreign countries has been developed by some National Laboratory of C S.IR.

Steps to End Rural Indebtedness

The Rajasthan Government has taken some "concrete steps" to free rural people from the huge debt liabilities which a survey conducted by the Reserve Bank of India in 1971-72 estimated at Rs. 280 crore. A study team of the Reserve Bank had estimated that nearly Rs 235 cr. per annum is required in the State as productive credit. Moratorium has been imposed in the State on the debts of small and marginal farmers, agricultural labour and village artisans up to March 1977, and not only the recovery of debts from them, but execution of decrees and hearing of applications have also been stayed.

The debts of marginal farmers and agricultural labour and village artisans having an income up to Rs. 2,400 per annum have been liquidated.

The provision of automatic redemption of mortgage of land has been amended in the Rajasthan Tenancy Act. The mortgaged land will now automatically revert to its owner after the expiry of five years from the date of mortgage without any payment Some 38,000 persons have been benefitted from this provision in law according to official sources.

Punjab—Top Rice Producer

Punjab has emerged as the top rice producing State in the country There has been rapid increase in the rice production as a result of the various steps taken by the State government. Punjab occupied an insignificant position on the rice map of India during 1965-66 (0.20 million tonnes out of 10.6 million tonnes) accounting for about one per cent. Until 1972-73 production was increasing at a slow rate But during the last three years there has been significant improvement in rice production from 9 55 lakh tonnes in 1972-73 to 11 81 lakh tonnes in 1974-75 It further increased to 14.45 lakh tonnes in 1975-76 Now Punjab has exceeded Tamil Nadu and Andhra Pradesh (important rice growing States) in rice yield. This year again, Punjab expects to achieve an all-time high in rice production – 16 to 17 lakhs tonnes Punjab's contribution of rice has also been rising significantly during the past five years During 1971-72, Punjab contributed 6 89 lakh tonnes to the Central pool and last year it rose to 11 52 lakh tonnes Punjab has achieved the highest per hectare yield in the country - 25 53 quintals

New Industrial Complex at Bahadurgarh

The foundation-stone of a new small scale industrial complex at Bahadurgarh in Haryana has been laid.

Bahadurgarh is one of those 17 towns which have been identified for priority development in the National Capital Region Scheme In the new industrial complex, package facilities and concessions will be provided to the entrepreneurs which include, among other benefits, exemption from electricity duty for five years, exemption from octroi for there years, from property tax for ten year sand interest free loan in lieu of inter-state sales tax upto 8 per cent of capital investment for five years.

The Haryana Financial Corporation has plans to open a sub-office in the industrial area itself to invite and speedily process loan applications. The Industries Department has already received nearly seven thousand applications from entrepreneurs for allotment of plots

Malaysian Order for Culcutta

A Culcutta firm has secured a substantial order for cast iron spun pipes from the public works department of Malaysia, against stiff international competition. The order comprising different size of pipes valued at Rs 1.87 million are of British Standard Specifications (BSS 1211) as required by the Malaysian PWD.

India's total export trade of iron or steel tubes and pipes was as much as Rs 70 00 million in 1975-76 Cast iron tubes and pipes alone fetched Rs 35 20 million, rainwater pipes netted Rs. 7.37 million, soil pipes secured Rs. 23.87 million, and other varieties of cast iron pipes and tubes brought in Rs 4 million. The leading customers were the United States, Kenya, Kuwait Delhi, Saudi Arabia, Hong-Kong, Iraq, Iran and Australia.

Widening Industrial Sector

Considerable investment has been made for establishing heavy and basic industries and for strengthening and diversifying the industrial sector in the country. The outlay for Industry and Minerals during the Fifth Plan is Rs 16,660 crore as against Rs 5300 crore in the Fourth Plan. The Central and State Public Sector investments envisaged during the Fifth Plan is Rs 9,660 crore as against Rs 3,050 crore in the Fourth Plan period.

As a result of this heavy investment the production of finished steel increased from about 1 million tonnes in 1950-51 to 5.8 million tonnes in 1975-76 The production of coal increased from 32 8 million tonnes in 1950-51 to nearly 100 million tonnes in 1975-76, cement from 2.7 million tonnes in 1950-51 to 4 6 million tonnes in 1975-76. The production of nitrogenous and phosphatic fertilisers increased from 9,000 tonnes each in 1950-51 to 1535,000 tonnes and 320,000 tonnes respectively during 1975-76.

Package Programme for Educated Unemployed

A Package Programme has been launched by the Industries Department in Haryana to help the educated unemployed in establishing their own industrial units speedily. Reputed consultants have been engaged to prepare profiles of projects of industries which offer scope in the State. This will enable the entrepreneurs to know the economic viability and manufacturing details of these items.

The Department has also arranged a three month entrepreneurship training programme at the Integrated Training Institute, Nilokheri, Small Industries Service Institute, New Delhi, and the Prototype Centre, Okhla,

Scheme for the Landless

The States of Maharashtra, Gujarat, Haryana, Himachal Pradesh, Punjab, Rajasthan, Uttar Pradesh and West Bengal and the Union Territories of Delhi, Chandigarh, Dadar and Nagar Haveli have either completed the work of allotment of house-sites to the rural landless workers or are on the point of doing so. The Government of Gujarat, Haryana, Punjab, Orissa and West Bengal have not stopped with mere allotment of house-sites to the landless families but have also launched an energetic drive to give assistance to the landless families directly as well as through banks, financial institutions etc. to construct their own dwellings on the house-sites allotted to them.

Regd. No. D(D)-152

Limestone Belt Found in Simla

An extensive belt of high grade limestone has been found in the Tons region of Simla district in Himachal Pradesh and the adjoining parts of Dehra Dun district in Uttar Pradesh. This has been revealed by the preliminary investigations carried out in the area by the Geological Survey of India (GSI)

In a part of the area, tentative reserves of about 1020 m. tonnes had been estimated. Actual reserves were likely to be far more. And with such prodigous potentials this area showed the prospects of becoming one of the prominent belt of high grade limestone type in the country. Analytical results of the samples were mostly indicative of a promising quality of limestones.

Houses for the Poor

The Bangalore Development Authority (BDA) has embarked upon an ambitious project to construct about 10,000 houses for the economically weaker sections in the city. Commercial banks operating in the city had come forward to finance the construction of about 1,000 houses under the project. The remaining houses would be financed by the B.D A. with the help of various financial agencies. After a careful study of the problem, B.D.A. had formulated a plan to construct 2.2 square houses at an estimated cost of Rs 5,150 each for the weaker sections. The B D.A would construct these houses and hand them over to site owners providing for repayment of the loan in easy instalments The State Govt. had offered to subsidise the interest charged on these loans

Engineering Unit's Turnover Goes Up

The turn-over of heavy engineering public sector units in the country is expected to be about Rs 8,500 million this year, registering an increase of 13 per cent over the production level achieved last year. These undertakings also in aggregate terms would make a profit of about Rs 580 million during the current year

India had a well-developed base of engineering industries covering a very wide spectrum. As a result of the sustained efforts jointly made by the industry and the Government, the engineering exports last year recorded an all-time high of Rs. 4,000 million. From the position of a net importer of steel in the past India has emerged as a exporter of steel and during the current year, the net foreign exchange earnings from steel are expected to be more than Rs 1000 million.

Indian Banks Do Well Abroad

The performance of the Indian banks abroad has steadily improved over the years. In 1973 their deposits totalled Rs. 261 crores and advances Rs. 219 crores In 1975 deposits rose to Rs 680 crores and advances to Rs. 612 crores. Apart from serving as a channel for inward remittances by overseas Indians, these banks are increasingly assisting trade between India and the country from where they function. Mainly, the Indian banks cater to the needs of the Indians settled abroad. That is why most of the branches are in U.K Hong Kong, Malaysia, Singapore, Mauritius, Kenya, Fiji, Uganda and Nigeria.

From 47 branches in 11 countries in 1972, the number of overseas branches of Indian banks in July 1976 has gone up to 79 in 20 countries. Similarly, of the total bank advances the share of the foreign banks in India had come down from 11 3 per cent in 1969 to 6 3 per cent in 1975.

Trade Pact with Hungary Extended

The long-term trade and payments agreement between India and Hungary, which was due to expire at the end of December, has been extended by one-year under a protocol signed in New Delhi. Under this protocol, Hungary will supply to India special steel products microwave equipment, machine tools, various kinds of machinery including garment making machines, a large range of testing and measuring instruments, components for hydro-power stations and drugs and medicines in bulk and chemicals. India will export to Hungary many non-traditional consumer goods such as tinned fruits, juices and vegetables, cosmetics and toiletries gramophone records including cassets, cotton hosiery and knitwear, garments, batteries, leather goods and stationery articles, besides traditional commodities such as deoiled ground nut cakes, iron ore, jute goods, textiles, tobacco, tea, coffee and mica.

Bonn Bank Loan for IFCI

The Industrial Finance Corporation of India (IFCI) will receive a new loan of DM 15 million (about Rs. 5.66 crores from the Kreditanstal fur-Wiederaufbau, a development bank of the Federal Republic of Germany. An agreement to this effect was signed recently in New Delhi.

With the sanction of the new loan, which is the 15th since 1963, the total KFW loan assistance to IFCI had aggregated DM 117.5 million or Rs 66 98 crore KFW loans have been utilised by a variety of industries of national importance such as synthetic fibres; paper, industrial and other machinery, motor vehicles and parts, metal products and electrical machinery and appliances. A significant feature of DM loans from KFW is that they are fully convertible and can be utilised for financing imports of capital equipment from any country. The import of technical knowhow, machinery drawings, and designs is also permissible.

Milk Products Plant by L & T

Larsen and Toubro Limited (L&T) will be supplying and erecting one of the largest milk product plants to be set up by the private sector. The plant is for the dairy planned to be put up at Jamkhandi in Belgaum district by Dempo Dairy Industries Limited. The plant will have a capacity to handle 130,000 litres of milk per day. Of this, 10,000 litres per day will be processed for distribution in liquid form The rest of the milk will be processed to obtain main products like skimmed and whole milk powder, baby foods and by-products like table butter, white butter, casein and ghee

L&T will design, supply erect and commission the plant and equipment for the project The process involves evaporation and suspended particle drying of milk. L & T will also supply and erect refrigeration plant, boiler plant and HT and LT switchgear The bulk of the plant and equipment for the Dempo Dairy will be fabricated at L & T's Powai Works

Rural Industrial Projects

A phased programme has been chalked out in Haryana aiming at the twin object of the dispersal of industries to the rural areas and to help the traditional rural artisans modernise their crafts About 9000 persons are likely to benefit by the end of Fifth Five Year Plan.

At present, two rural industrial projects are functioning in the State. The Hissar District unit covers Hissar, Bhiwani and Sirsa districts The other unit covers Mahendergarh district.

About 625 small scale industrial units are being assisted under the above projects on the basis of findings of a Techno-Economic Survey Committee. Additional employment opportunities are being created for about 6,000 persons in these districts. The aim is to create local entrepreneurship, utilisation of local resources and mobilisation of available local skill.

The hereditry artisans are being imparted training for improving their skill and techniques of production

Rise in Export of Electrical Goods

India's exports of electrical products which amounted to only Rs. 19.3 million in 1960-61 increased to Rs 573 million in 1974-75 and during the last year jumped to the level of Rs 640 million. This rapid rise was possible both on account of market diversification and expended product mix.

The export value of electrical power machinery and switch gears improved to Rs. 166.52 million in 1975-76. Equipment for distribution of electricity netted Rs. 176.67 million against Rs. 151,58 million. Tele-communication apparatus fetched higher at Rs. 85.22 million compared to Rs. 66.31 million and other electrical machinery and apparatus Rs. 127.56 million as against Rs. 1.18 million. There was, however, some decline in respect of domestic electric equipment at Rs. 80 million compared to Rs. 83 million.

Ceiling fans made in India have established themselves in the world markets with assured and growing export income year after year. The quantum exported in 1975-76 was in the neighbourhood of 318.400 and the export value was as much as Rs. 64 million.

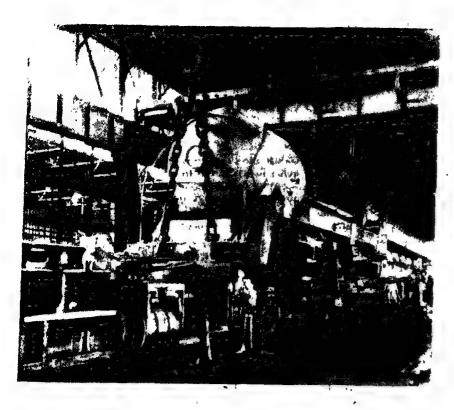
EDITORIAL

A CHALLENGE THAT BROOKS NO POLITICS

Development economics in the last thirty years has given rise to far too many cliches for the un-informed man to comprehend the real significance of the various experiments made to uplift the social-economy of the countryside. The facts that over 70 per cent of the population are dependent on agriculture, that the pace of urbanisation in India has been alarming, that the key to the future of farmers and unskilled labourers is dependent on the successful transfer of intermediate technology at various levels, the fact that plenty of money and effort have gone into the programmes of the community development, major and minor irrigation schemes, Small Farmers Development Agencies and the Marginal Farmers and Agricultural Labourers Development Agencies, the Crash Scheme for Rural Employment, the Drought-prone Areas Programme, the Tribal Area Development Programme, the Hill Area Development Programme, the Minimum Needs Programme and various other schemes designed to improve the lot of the handloom workers, artisans etc., have been well published. They have, as a result, had a accumulative effect on both the economy and the psychology of the people. It is well-known that India's future is very closely linked with development efforts in the fields The problem is not as simple as finding money and technical skills to implement programmes of agricultural development. All the Five-Year Plans have emphasised, with considerable lucidity, the need for engineered social change—a concept which takes into account the human being and the resources together. The results have no doubt been very impressive on many fronts. For instance, we have more than doubled the irrigation potential since 1951 by adding nearly 25 million hectares to the original 22.6 million hectares of irrigated land in 1951. We have brought electricity to a majority of the villages. The farmer is far more educated and enlightened today than his father ever was. He uses hybrid seeds, pesticides, fertilizers, and scientific crop pattern techniques and can speak knowledeably of the new agricultural technology. He knows today the value of environmental stability.

With all this, more than one-third of India's population is below the poverty line and the problem would not have been half as complex or disheartening if the population growth had been kept severely under check. The nation's principal worry today is how fast we can advance on the rural front to keep pace with the growing problem of rural unemployment. The Finance Minister Shri Subramaniam's paper of March 15, 1977 entitled "Strategy for Integrated Rural Development" presents the entire problem in a new perspective, outlining a multidimensional approach to engineered change. In this nation-wide task of harnessing technology to the welfare of the masses, various institutions are being involved. A beginning has been made with the budgetary provision of Rs. 15 crore with the promise of more money coming in as the programme gathers momentum. In the 20 districts that have been selected for the programme all over the country, universities, colleges, schools and technical institutions, CSIR and the ICAR are all being involved. The IRDB has, in the last one year, commendable performance to its credit and it is not unreasonable to expect that in the years to come this experiment will snow-ball into a big national effort. what it calls for is total dedication on the part of everyone and the role that the beneficiaries themselves have to play in transforming the rural society into a progressive force will provide the answer to the future of India. The commitment has to be total and are we going to meet this challenge?

The ravages of the Second World War, followed by the aftermath of partition left Indian Railways with a large fleet of over aged rolling stock. Today the Indian Railways have established a reputation in the world market as one of the premier manufacturers of all types of locomotives, coaches and wagons.


RAILWAYS

A GIANT INDUSTRY

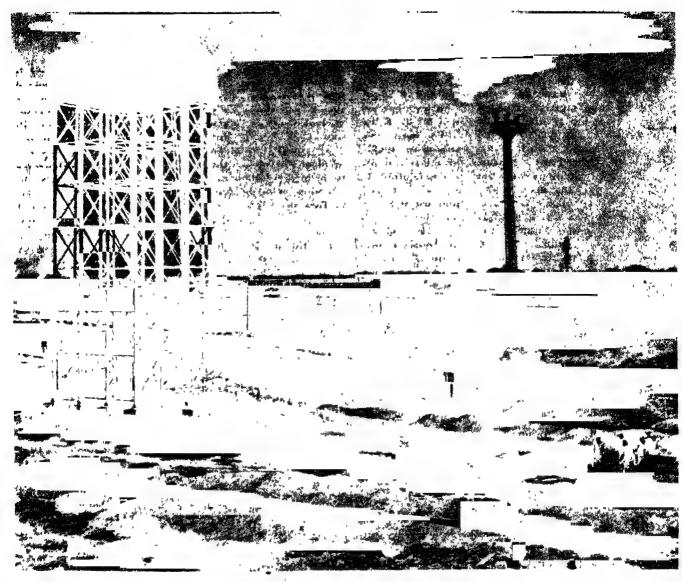
P. N. KAUL
Member, Mechanical Railway Board

INDIAN RAILWAYS have been the pace-setter for the industrial growth in the country. Railway workshops were amongst the first to appear on the horizon about a century ago against the predominantly agricultural background.

Of the total investment of over Rs. 5,200 crores in the Railways, the investment in rolling stock, locomotives, coaches and wagons is about Rs 1,700 crores. The efficient maintenance of the huge stock of 8,500 steam locomotives, 1,800 diesel and 750 electrical locomotives, 37,000 coaches and over 4,00,000 wagons has been entrusted to 46 mechanical workshops of the Indian Railways These railway workshops were modernised from time to time keeping in view the changing circumstances and the introduction of sophisticated rolling stock so as to be ahead of obsolescence.

The ravages of the Second World War, followed by the aftermath of partition left the Indian Railways with a large fleet of overaged rolling stock. Before Independence, Indian Railways were dependent for their rolling stock requirements on imports to a large extent. It was becoming difficult to keep pace with the increased demand of traffic generated by the industrial growth and economic development in the country. The immediate task before us was to attain self-sufficiency in the various requirements of rolling stock. Progress in indigenous production of rolling stock has made impressive headway, both in diversity and volume.

Above : A broad gauge locomotive being attended to at the South East Railway's Workshop, Kharagpur.

Below : Assembly shop of the Diesel Locomotive Works at Varanasi.


Wagons move ahead in mughalsarai marshalling yard.

Today the country is not only self-sufficient in the manufacture of all types of locomotives, coaches and wagons, but has also developed export potential in the midst of international competition.

Chittaranjan Locomotive Works

First in the series of production units was the Chittaranjan Locomotive Works. The factory at Chittaranjan was originally set up for production of steam locomotives. The construction at site was started in May 1948 and the first steam locomotive rolled out of the factory in November 1950. After producing 2,291 broad gauge and 60 metre gauge steam locomotives, the manufacture of broad gauge steam locomotives was discontinued from July 1970 and that of metre gauge steam locomotives from January 1972. With the modernisation programme undertaken by the Railways and with a view to achieving economy in transport cost and also generate additional traffic capacity with minimum inputs, it became necessary to go in for dieselisation and electrification

Production of electric locomotives was started at Chittaranjan in 1961 and upto March 31, 1976 the Chittaranjan Locomotive Works produced 75 DC electric locomotives, 469 AC electric locomotives and 259 diesel shunters. Five AC/DC electric locomotives for operating both on 1500 volt DC and 25 KV AC have been manufactured.

The electric locomotives now being produced by Chittaranjan have all been designed by the engineers of Indian Railways and this has been possible owing to development of a modern industrial base in the country since Independence.

Apart from meeting the requirements of Railways, the Chittaranjan Locomotive Works is supplying diesel shunting locomotives for various public sector undertakin such as port trusts, steel plant I.O.C. state electricity boards an fertilizer plants More than 7 diesel shunters have been supplie to these units till the end of Marc 1976

Another notable feature of th production unit is that it man factures all its requirements of fo

Railways are responsible for quick distribution of oil throughout the country.

gings, steel castings and high grade grey iron castings. Besides meeting its own requirements, the unit supplies all the steel casting requirement of the sister locomotive production unit, viz. the Diesel Locomotive Works at Varanasi. Encouraged by the success achieved by this unit in the production of sophisticated iron castings for diesel engines and transmissions for locomotives manufactured at Chittaranjan, this unit was entrusted with the task of developing and establishing series manufacture of alloy grades of castings for the diesel engines manufactured by the Diesel Locomotive Works, Varanasi These castings were hitherto being imported. Entirely with its own efforts and technical skill, the Chittaranjan Locomotives Works has succeeded in developing the difficult castings, such as cylinder heads, cylinder liners and turbo-charger castings Series manufacture of these castings for supply to the Diesel Locomotive Works has been commenced. This is a notable breakthrough achieved by this production unit in the matter of eliminating imports and conservation of foreign exchange. This effort alone will result in an annual saving of Rs 1.5 crores in foreign exchange

Integral Coach Factory, Madras

The second production unit to be set up by the Railways was the Integral Coach Factory at Madras Twentyone years ago, on October 2, 1955, Shri Jawaharlal Nehru, Prime Minister of India, formally inaugurated production at the Integral Coach Factory. Initially, the factory was set up for manufacture of only shells, which were to be sent to different railway workshops for furnishing. Later, in 19[illegible], a furnishing division was also started. A full-fledged annexe, capable of furnishing the entire production of shells from the Integral Coach Factory was set up in 1960-61. Upto the end of March 1976, this production unit has produced 11,243 shells and 9,230 fully furnished coaches.

To meet the growing needs of suburban traffic, the manufacture of a large number of electric multiple unit stock has been successfully carried out by the Integral Coach Factory without any foreign collaboration

Deluxe air-conditioned trains, with coaches produced in this workshop, are running between Delhi and the metropolitan cities of Calcutta, Bombay and Madras. For improving frequency of these services, air-conditioned deluxe trains, with end-on generation power cars, were successfully designed and built by the Integral Coach Factory The experience gained in building the deluxe rakes enabled the Integral Coach Factory to build coaches for the premier high-speed trains of Indian Railways, namely, the Rajdhani Express

Diesel Locomotive Works, Varanasi

The establishment of the Diesel Locomotive Works at Varanasi in 1961 opened a new chapter in the history of modernisation of motive power to cope with the demand of increased traffic Diesel traction is more versatile and flexible From a modest start in 1964 with 100 per cent imported components of the 2600 hp diesel engines, the Diesel Locomotive Works has done commendable work in establishing production with nearly 90 per cent indigenous components and achiev[illegible] 120 engines and is expected to achieve a level of production of about 125 diesel engines in 1976-77.

What needs to be appreciated is the fact that unlike the advanced countries of the world, where the diesel engine preceded the development of diesel locomotives for rail traction, the D.L.W. had to develop the manufacture of diesel engines, side by side with the development of locomotives, against the background of an inadequate industrial base from which these works could draw supplies of highly sophisticated components The foreign exchange content now is confined to certain hard core items only, like crankshafts, pistons, valves, a few

Starting from an humble beginning with a pair of oxen to pull the train, Indian Railways have today express trains from East to West and South to North with a running speed of about 100 kilometers.

*** With 8,757 route kilometerage of railway lines in its territory, the State of Uttar Pradesh has the maximum kilometerage of railway lines among all the States. Madhya Pradesh comes next with 5,733 rt. kms. followed by Gujarat with 5,651 rt. kms.**

*** The route kilometerage in other States is Rajasthan 5,618, Bihar 5,385, Maharashtra 5,232, Andhra Pradesh 4,725, Tamil Nadu 3,765, West Bengal 3,712, Karnataka 2,806, Assam 2,194, Punjab 2,134, Orissa 1,960, Haryana 1,400 Kerala 890, Himachal Pradesh 256, Jammu and Kashmir 82, Tripura 12 and Nagaland 9.**

*** The States of Manipur, Meghalya and Sikkim are yet to have a railway line.**

*** Punjab has 42.39 rt. kms of railway line per 1,000 sq. kms. of area followed by West Bengal with 42.25, Haryana 31.66 Bihar 30.97 Uttar Pradesh 29.40, Tamil Nadu 28.95, Gujarat 28.83, Assam 27.94, Kerala 22.90, Andhra Pradesh 17.07, Maharashtra 17.00 Rajasthan 16.42, Karnataka 14.68, Madhya Pradesh 12.95 and Orissa 12.40.**

*** As far as route kilometerage per lakh of population is concerned, Rajasthan has 19.58 kms. of railway lines followed by Gujarat 19.09 Punjab 14.49 Assam 13.27 Haryana 12.73, Madhya Pradesh 12.43 Andhra Pradesh 10.02, Maharashtra 9.47 Uttar Pradesh 9.13, Bihar 8.86, Tamil Nadu 8.43, Orissa 8.19, Karnataka 8.07, West Bengal 7.62 and Himachal Pradesh 7.05.**

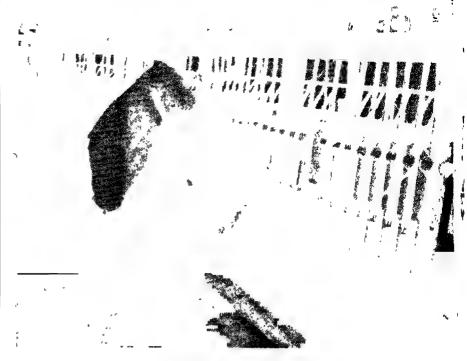
SPURT IN LOADING THROUGH FREIGHT FORWARDERS

Railway earnings from loading of goods through Freight Forwarders increased to Rs. 77.64 million during July 75 to December 76 period from Rs. 61.72 million in January 74 to June 75 period. This shows an increase of over 25 per cent in Railway earnings under the Freight Forwarder Scheme.

During the 18-month period between July 1975 and December 1976, the Railways loaded 23,482 wagons of goods collected by the Freight Forwarders from the trade and industry in small quantities and offered to Railways in wagon-loads. This is 2633 wagons more than 20,849 wagons loaded during the previous eighteen months.

Railways also accept parcels under the Freight Forwarder Scheme. During the July 75 to December 1976 period, the Railways loaded 3095 parcels earning Rs. 6.4 million as freight, as compared to 1896 parcels earning Rs. 5.1 million during the previous 18 months.

The spurt in loading on the Railways can in a way be attributed to the fact that all quotas and restrictions on the movement of traffic have been lifted and free flow of traffic over all routes and break-of-gauge transhipment points ensured. A significant breakthrough has been achieved in movement of traffic to Assam and other North-eastern States.

The rail transport capacity for freight traffic during this period has, for the first time, outstripped wagon demands. The outstanding demands for wagons which stood at over 137,000 on BG and over 169,000 on MG at the end of June 1975 came down to about 7,200 on BG and 3,800 on MG at the end of December 1974. This has been possible only on account of the improved availability of wagons as a result of the improvements in the operational efficiency of the Railways.


With the introduction of sophisticated rolling stock the old system of inter-locking rails has been modernised

componants of the turbo charger and special type of tri-metal bearings

The D L W started with the production of a 2600 hp broad gauge locomotive and later on added to its manufacturing range a 1350 hp metre gauge locomotives, a heavy duty diesel shunter for meeting specific requirements of our steel plants and diesel generating sets. Upto the end of 1975-76, the D L W had manufactured 688 BG diesel locomotives, 169 MG diesel locomotives, 37 diesel shunters and two diesel generating sets

Exports

Indian Railways entered the field of exports in a small way by exporting two carriage bogies to Thailand in April 1967 The next year, 66 carriage bogies were exported to Burma. The Indian Railways have since established a reputation in the world market as one of the premier manufacturers of coaching stock. They are now capable of manufacturing and exporting diesel locomotives of 2600 hp and 1400 hp. The Indian Railways have so far either executed or are in the process of executing orders for diesel electric locomotives, steam locomotives, carriages and their components. Exports of railway equipments and components have been made to various countries like Thailand, Burma, Nigeria, Syria, Taiwan, France, Canada, Zambia, Philippines, Tanzania and Nepal.

Though the Indian Railways have not exported wagons, as these are built mainly in the non-railway sector, the Railways render continuous assistance in the export of wagons by providing the necessary consultancy services

It is a matter of justifiable pride that these production units have helped and encouraged indigenous industries, both in the puublic and private sector, to establish production of sophisticated components for their manufacturing programme. Today Rs 230 crores worth of locomotives, carriage and wagon materials are bought annually from indigenous sources. Our efforts in this direction are continuing with more and more vigour and we are hopeful of getting the needed response from the Indian industry in our Swadeshi drive. □

PRODUCE MORE FOR SELF-RELIANCE

Railway Museum

A YOJANA Spot Report

by

S. RADHAKRISHNAN

Vintage Trains Tell the Story of A Major Public Undertaking

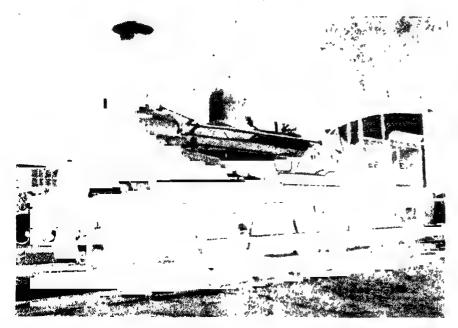
THE INDIAN RAILWAYS, was inaugurated on April 16, 1853. The first train steamed out on its maiden run from Bori Bunder to Thana, a distance of 35 kilometres A lot of water has passed under hundreds of railway bridges since then Today, the Indian railway network, Asia's largest and the world's fourth largest railways, covers over sixty thousand route kilometres with nearly 11,000 trains running everyday and covering a distance of over 1.2 million kilometres. With the growth of technology new and more expedient systems are coming into vogue, unconcerned with the beauty and the charm of the old

But the old cannot be forgotten. It has more than a museum value. The vintage loco museum at Delhi, built at a cost of Rs 4 5 million carries the visitor into history and presents a very interesting story.

Over five years ago, on October 7, 1971—to be precise, the foundation stone for the Rail Transport Museum was laid by the then President of India Shri V.V. Giri. The first of its kind, the museum sprawls over an area of 10 acres and comprises an octagonal building that houses six display galleries and a large open area simulating the atmosphere of a railway yard

The galleries display historical documents, working models, photographs and charts, the early development and growth of the Railways, engines and rolling stock, signalling and telecommunication equipment, engineering, construction and railway architecture. There is a gallery that displays post independence development of the Railways with its accent on self-sufficiency, export promotion and future plans

As you view the galleries, you will find that the double decker bogies that are so popular now was no novel idea They were in vogue as early as 1896

There are interesting models of ships and engines, coaches, wagons, coats of arms, clocks and photographs


There is a working model of the Cugnot Steam Vehicle. It was the first steam road carriage and was designed by a Frenchman Nicholas Joseph Cugnot in 1770. It worked at a maximum speed of two and half miles per hour and had to stop every 15 minutes to build up steam pressure. The original vehicle is now preserved in Paris.

An apparently irrelevent exhibit, youwill be amused to see a large white piece that looks like the skull of a monster. It is in fact the skull

Skull of the elephant that derailed a seven bogie train in 1894

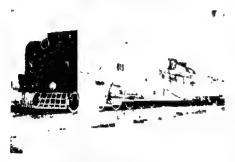
of an elephant that derailed an entire seven-bogie train on the Bengal—Nagpur Railway in 1894. The elephant caused this accident in the Saranda Jungle near Goilkera at a distance of 220 miles from Calcutta while the jay walking monster was crossing the track The elephant's tusks had to be cut before the train could move. One of the tusks was sent to the Board office in London and the other was retained by the driver James Bell, who later donated it to the Railways

In the yard, there are vintage locos, fanciful and ornate carriages and saloons used by former rulers and dignitaries kept in natural surroundings on tracks of various gauges. Like period furniture, they each have a story to tell, rich, exciting and colourful.

Fairy Queen, The oldest locomotive in the country, was built in 1855

'Fairy Queen' the oldest surviving member the locomotive family in India was built in 1855 by Ms Kitson, Thompson and Hewitson of Leeds, England. It was introduced on the Howrah-Ranigunge section of the East Indian Railways for hauling light mail trains. It was in operation till 1909.

An unusual little locomotive 'Ramgotty' was one of the six built by Anjubault of Paris in 1862-63 for the Indian Branch Railway. Normally Broad Gauge is 5 feet 6 inches wide and metre Gauge 3 feet- 3-3/8 inches wide, Narrow Gauge being still narrower But this loco was built for a four foot gauge line running along the side of the road between Nalhati and Azimgunge in Bengal. This engine was altered to broad gauge dimensions in 1896, after being taken over by the East Indian Railway in 1892, and was used as a shunter at the Jamalpur workshop

Another fascinating piece is a four-wheeled rail car fitted with a


This 234 tonne Garrat Engine is the heaviest engine in the world

petrol engine. From the outside it looks like a car moving on a railway track and at one time was used by inspecting officials between Simla and Kalka

A saloon used by the then Maharaja of Mysore is on view in the Museum The coach was built in 1899 and can be used both in broad gauge and metre gauge by changing the bogies. The body of the saloon is made of fine teakwood with inside panelling and an ornate ceiling including Silver lamp shades and outside lining of gold and ivory. The original fittings including an icebox, is in working order. Brass railings are seen outside the saloon in the verandah.

A saloon used by the Gaekwar of Baroda is also on view for the public. The original jade and gold ceiling was damaged. But it has been reproduced with a small portion of the original visible through a small glass panel. The fittings are all original

Saloon used by the then Maharajah of Mysore. The luxurious original fittings have been kept

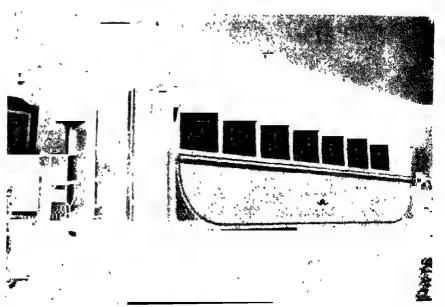
The Patiala State Monorail Trainway Saloon is no monorail saloon in the real sense. It is true there is only one track and there is only one wheel But to the right of the carriage there is an extra wheel at the end of an outrigger that runs not on the track but the road However, it has managed to survive with the original name given to it The exhibit is a reproduction body built at the Amritsar workshops in 1976 on an original underframe The coach was the private inspection saloon of Col. Bowles, who built the Trainway in 1907 The first Trains were pulled by mules But later on engines were provided.

There is also the viceregal dining saloon which was part of the Viceroy's train It can seat eighteen people. The original fittings have been preserved.

The saloon in which the Prince of Wales (later King Edward VII) travelled is also among the exhibits. This was built in 1875 at the Agra Workshop and in the following year was used by the then Prince of Wales for his journeys on the metre gauge section when he came to attend the Calcutta Durbar. The original furnishings have been preserved and is fitted with gas lights. It is an example of a high degree of comfort and craftsmanship.

There are 43 Vintage locos and 17 quaint saloons and coaches in the yard There is also a working joy rail which give children and adults, a joy ride round the yard.

This sprawling complex promises to become a major tourist attraction in Delhi □

This posh saloon was built for the Prince of Wales (Edward VII) when he came to India to attend the Calcutta Durbar


UNLICENSED RADIO/TV SETS VOLUNTARY DISCLOSURE SCHEME

Have you got a transistor, radio or TV without a licence?

Here is an opportunity to regularise your possession

You can get a licence without paying any surcharge.

You need not produce evidence of purchase or transfer for such a set. The Post Officer will accept the date of acquisition of the set as given by you

You can also renew your old licences with restorpective effect without paying surcharge.

Licences which expired on December 31, 1976 can also be renewed without surcharge during this period

This concession is open for three months from February 1, 1977 to April 30, 1977

If you miss this opportunity, you may have to face prosecution and pay the surcharge

Please Note

IT IS ILLEGAL TO POSSESS A WIRELESS SET OR TV SET WITHOUT LICENCE.

The fee for additional sets, now disclosed, will be Rs. 15 and not Rs 3 during the concessional period. It will, however, be Rs. 3 for subsequent renewals.

If your radio set does not exceed Rs. 150, a cash memo is necessary for getting concessional licence of Rs. 7 50

DISCIPLINE IN ANY form is an element of all organized activity, whether economic, social or military. In economics, it performs the function of setting limits to individual behavior (such as a *consumer* or a *firm* or a *monopoly Seller* or *buyer)* which may jeopardize the interests of the Group (like a group of *consumers* or the entire *industry* or even the *market structure*). By doing so it maintains a certain order as chosen by respective economic system. In a purely capitalistic system the limits may take the form of profit motive; in a mixed economy the limits often take the form of mandatory state controls; in a socialistic system the limits take the form of further state controls as well as state ownership. By its nature discipline is negative usually operating through penalities for inaction or inappropriate action, rather than rewards for right action as in the case of incentives. Thus, a critical question within any economic system becomes what form of discipline is to be imposed and by whom. It is therefore a difficult task for Political Economists to strike a balance between *economic severity* and *individual leniency*. In general the answer has been cued to the needs of the society, tending toward vigor in times of scarcity and toward relaxation in times of prosperity.

Discipline and Economic Development

THE CASE OF INDIA

Forms of Economic Discipline :

An attempt has been made to group the forms of discipline into three broad categories Such a classification is based on the means of action used by various nations practising different economic systems to attain self sustaining growth. In particular the study utilizes the recent policies persued by India to bring about domestic economic discipline which is a precondition for development. Th realms of discipline differ, depending on one's view of the relative weights given to the *economic rights of individuals* versus the *rights of the organization of the economy* The three broad categories of discipline are :

1) Economic Discipline in Pure Form:

In its pure form economic discipline is authoritarian both in judgement and execution. There is no provision for appeal At the most only under stringent and scracity conditions of goods and services—exceptional arrangements are permitted for review. Conduct in consumption and production are customary, understood; adjudication prompt and final. As examples—an employer fires a worker and no questions are asked or in a *fair price* shop prices are fixed and no haggling takes place. Every economic action is adhoc discretionary at the will of the final authority, be it a consumer or a producer. Further, if the rights of the authority are supreme and unquestioned—economic discipline may become anarchic. This means that the economic conduct of subordinate units have one option viz they comply with the direction of higher authority. Thus discipline in pure form allows for only limited cooperative economic action.

(2) Self Determined Economic Discipline :

At the opposite end of the spectrum the economic rights of the individuals may be supreme and thus discipline becomes a matter of choice for the individual. This means that the conduct of subordinate economic units is self determined The individual may comply or fail to comply with the directions of the economic system as it seem fit. These directions are usually broad by nature and relate to production and consumption For example —a worker may be given order and yet he may decline the work assignment without fear of repraisal. In this case, the worker may be protected by a union. The responsible authority in this case may either permit the free choice of the individual or have insufficient powers to enforce stated rulings. The economic consequence of such a system is that rulings of the authority are often challenged and it results in delays and lags in production and thus bottlenecks in the intersectoral linkages of the economy. A further result may be scaricity, unemployment, inflation and a growing dependence upon a welfare state. The recent examples of this are prolonged strikes by the United Rubber and Auto Workers of U.S.A.

By its very nature the discipl through self determined process inimical to organized economic a vity—hence it can be regarded the antithesis of discipline.- Mo fications of authoritarian disc line in the direction of protection the economic rights of individu are movements towards self det mination.

(3) Economic Discipline by D Process :

The intermediate form of disc line is by due process. Econor discipline under this system is bas upon a body of recognized rules consumption, production and dis bution of goods and services It administered under some form judicial or legislative or consti tional procedure In such a syst there are agreed upon standards economic conduct and behavi Usually these standards are publi ed in statue, codes, conctracts et however, often these standards informal though universally acce ed in the economic system A there are agreed standards of m conduct like, hoarding of essent consumer goods by the middle m to seek more than normal profi smuggling of non-essential goods encourage conspicuous domes consumption—all of which are d terrent to the national econon growth. Specific penalties for vario classes of economic misbehaviour often expressly stated and ma known to all within the jurisdic tion. The administration of disci line by due process is either in t hands of a disinterested third pa

like police force or courts or arbitrating tribunals and generally appeal is allowed (unlike economic discipline in due form). The absence of formal methods of charging, investing, proving and punishing the economic mis-conduct will amount to denial of the due process. Thus economic discipline by due process attempts to balance the rights of the individual with the needs of the economic system An "economy law" replaces an "economy by individuals" even though the individual is still paramount to the success of the organization as a whole[8] Adopting a system of economic discipline by due process is consistent with a society committed to the ethics of individualism and yet from the stand point of economic organization, there may be accompanying liabilities—it may be cumbersome, time consuming, inefficient and often annoyingly delaying Rules grow, interpretation becomes more difficult, precedent multiply and the system may fail to work as envisioned Rapid shifts of policy to conform to changing structural and external economic conditions become more difficult Thus a system where due process has existed over time may be ripe for change--with those in authority seeking discipline in the pure form and individuals seeking self-determination.

Theoretically a peaceful system is the ideal state of economy, with coercion absent-cooperation based on agreed division of production and norms of distribution The ethical basis for this view is to teach full responsibility to the economic individual towards self-discipline and in some small intelligent groups, with a full understanding of problems shared by all In the present highly organized and intensely competitive state of human and economic affairs, it may be disregarded, other than as standard comparison at the opposite extreme from absolutism While imposing economic discipline, it must be borne that the interests of the individual are short run and the needs of the society are long run Unless it is a well balanced compromise, it may imperil the latter in periods of shortage and stress.

Discipline as a Premise and Prerequisite for Greater Productivity—The Case of India

Any industrial society requires discipline of a particular form. No doubt, a predominantly agrarian society such as India after nearly two centuries of British contact has been socially and economically disorganized The British had successfully instituted a "resource drainage economy" out of India. After independence old order has crumbled without being replaced by an established new order. Individualism, skepticism, emancipation and competitiveness—features of the western democratic industrialism have penetrated into the old Indian social order, corroding and undermining it and thus causing its disintegration. The old agrarian order has found difficulty in coping with the radical changes and the social dualism persists acting as a constraint to social change and economic development.

In fact in the case of India, the emphasis of its traditionalism is largely on spiritual attainment and thus the primary socio-economic relationships have revolved around the caste, the village which have resulted in group exclusiveness. Further, rapid industrialization and economic development requires severe sacrifice and many Indian sects who are superstitious and believe in fatalism have resisted it during the last two and one half decades of planning in India

Since 1947 India has attempted to combine what are often considered to be incompatibles political democracy and the alleviation of wide-spread poverty The results have been mixed There has been progress in some areas and difficulties in others During the early seventies the failures have become particularly painful, widespread scarcities and rapid inflation Public Law 480 wheat from the United States became scarce and the Indian consumer was dependent upon the free market for necessities; a pound of rice often cost more than a worker could earn in a day. Other shortages also existed kerosene, petrolium, pharmaceuticals as well as other critical inputs As the dimension of the problem grew rioting broke out in several parts of the country and the fear of authority that was ingrained in the national consciousness during the one hundred and fifty years of colonial rule disappeared. Police became the object of protest, particularly by the young who attempted to disrupt the social and economic order.

The important question which began to be asked in India as well as elsewhere was where the Indian economy headed. The concept of Indian unity also was questioned and fears existed that the situation would deepen unless the country could regain the economic momentum of the fifties. It was obvious to many again both within the country and outside that a new discipline was required for the Indian economy. Had such a discipline been practised since independence through strict implementation of legislations, India would have avoided the deepened crises of early seventies The following section outlines some of the disciplinary measures recently adopted by India

These measures have far reaching social and economic consequences on the rural population of India. Essentially they aim at increasing the perceptibility of all sections of the population towards growth. Thus India had no soft alternative to combat her problems other than seeking the choice of disciplining her population through a more stringent form of "*due* process" in order to exercise constraint in consumption and to adopt new and faster means to increase productivity

(a) New Norms in Family Planning

Demographic experts have forecast that India's population will exceed 1,000 million by the turn of the century. India is a secular country comprising several religions, the most prominent of which are the Hindus, the Moslems and the Christians With vast religious diversity and each religion advocating its own philosophy of family growth and composition, the task of Indian planners in restricting the population growth becomes difficult. For example, the Hindu orthodoxy tends to favour continence and self-control and counsels against what is described as unnatural means to prevent child birth

Islam on the other hand permits only one method of birth control—*coitus interruptus*. The Moslem philosophy is against compulsory sterilization Even the Catholic church has favoured abstinence and oppose any artificial or unnatural means to limit births.

Despite the vast religious diversity and opposition, India was the first country to embark on an official family planning programme in 1952. The importance of family planning in a developing economy with a rapidly growing population has been fully recognized by Indian planners. Allocation of funds for the programme by the Indian Government increased from 0.30 million in the First Five Year Plan to 370 million in the Fourth Five Year Plan. It is evident from the available data

or the past few years, that the voluntary programmes of family planning have not been very successful especially in rural areas. A reduction in fertility rates needs motivation but such motivation was not found in India because of complex socio-economic and religious conditions The experience has proved that mere propaganda or provision of contraceptives will not produce the desired results. It can come either by regimentation or by forced economic development which will involve the majority of the people in the country's growth process. In turn this would take several years before any results are produced.

In order to avoid the explosion of "population bomb" the only alternative left to Indian planners was to impose mandatory measures such as compulsory sterilizations, restrictions on family size and banning early marriages Certainly compulsion of any form will not be easily accepted by all the sections of multi-religious population Yet the gravity of the issue is beyond doubt as it involves not only the existence of present generation but the future as well

A prerequisite for the success of new kind of "population revolution" lies in making the citizenary of India realize the catastrophic consequences associated with the present population growth rate of .5 per cent

Again since voluntary compliance alone cannot be expected to produce results at least in the near future the only option is to resort to more stringent measures For example during the current year one state, Maharashtra has imposed mandatory measures such as compulsory sterilization for couples with three or more children. Also in April of this year (1976) India announced a package of incentives and controls to achieve smaller families including an increase in the minimum marriage age from 15 to 18 for girls and 18 to 21 for boys The total package is designed to decrease birth rate by 1984 from 35 to 25 per thousand or a corresponding growth rate of 1.4 per cent. In addition the government has also established population control objectives, such as a target of 4.3 million sterilizations for this year more than three times the level of any previous year.

The above and other more stern measures imposed by state governments can produce the desired results. Most recent statistics indicate that nearly two million sterilizations have been achieved within the past five months as compared to only 437,400 people in the same five months of last year.- Thus it may be concluded that a new form of discipline in this area is yielding positive results. yet more remains to be done

(2) **Decline in the Inflation Rate :**

In the first six months of 1974, the country was experiencing a runaway inflation of between 25 and 35 per cent. However, with the aid of a strong anti-inflationary programme announced by the Indian planners which attempted to curb speculation by a more disciplined use of bank credit consistent with the broad national priorities and with the need for stimulating production in the priority sectors—wholesale and retail prices of a large number of articles have since declined sharply India currently has the distinction of being one of the few countries where inflation has been controlled Since April 1974, inflation has decreased from 30.1 per cent to 6 5 per cent in April 1975 and 2 1 per cent in July 1976 - Taking the world as a whole (excluding the Socialist block countries) the inflation rates for the corresponding periods of time were 14 6 per cent and 14 4 per cent. Compared with the less developed countries of the world the gains made by India in the area of inflation control are even more impressive

According to a recent report of the World Bank, India's anti-inflation program has been one of the most successful in the world and that inflation has been brought under control It is important to note that in India the objective was not to bring about a slump in prices but to stabilize them at economically desirable levels.

These facts are an indication that restrictive financial policies can work. The present policy of restraint has helped to prevent inflation from destroying the Indian economy. Again it must be noted that monetary descipline can and did play a role in the control of inflation.

(3) **Enforcement of Land Reforms :**

Professor Warriner, in his book *Land Reform in Principle and Practice* noted that in India the problem of relating land reforms to development policy is highly complex He further observes that too many legislations were enacted in the past without being vigorously implemented Looking at the statistics of the early seventies, it was difficult to believe that tenancy conditions could be improved for the rural farmers.

At the time of independence more than 98 per cent of all agricultural land was owned by only 10 per cent of the feudal population. After 25 years of planned efforts, 80 per cent of all the agricultural land was owned by 15 per cent of the population. The remaining 85 per cent did not even have enough land to live on. Since June of last year nearly 39 million acres of "surplus land" has been made available for distribution to the landless. This task was made more difficult since 17 states out of 22 did not have adequate land registration The average acreage of land ownership in India per family is now between 17 and 20 acres In 1975, the Indian planners gave land reform top priority with greater emphasis on better maintenance of land records. As a result several thousand hectares of land have been distributed to the poor.

(4) **Provision of Housing for the poor:**

At the time of independence the housing situation both in the rural as well as in the urban was inadequate. In rural areas homes often did not have any modern hygenic amenities which are considered indispensable in Indian towns and cities

Dwellings were often only one or two rooms Sanitary condtions were appaulling and it is not unusual to find one water tap for several dwellings Yet the working class spent about 20 per cent of their total income on housing or rent; one can certainly speak of exploitation by landlords Such exploitation by landlords continued for some time and even governmental housing policies were discriminatory against the poor Planned housing construction were for upper and middle classes whereas the poorest classes suffered most

According to a report by the National Committee on Environmental Planning and Coordination released this year, nearly 30 percent of India's urban population lives in slums or in squatter settlements. The report noted that in 1953 in the capital city of Delhi there existed one squarter household for every two non-squatter hold for every two non-squatter households. in 1973 the ratio was one to five The squatter population of Delhi has been growing at a rate of 12 per cent per year for this period while the population growth in general was 4.5 per cent. The growing number of slums and squatter population in India has made it

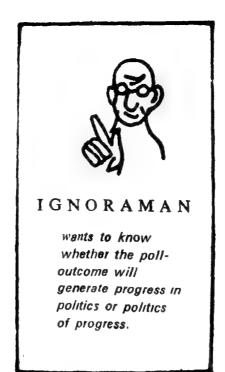
necessary for its planners to adopt more stringent and what may be painful measures to control and solve housing problems.

A recent programme of making available housing parcels for landless and poorer groups of the population will help to ease the problem The goal of working against a further spread of slum districts is a needed measure from both a socio-economic point of view as well as ecological point of view The most recent program of slum clearance has made progress in several ways viz:

(a) land speculation has been somewhat checked, thereby controlling the rise in the price of land and houses,
(b) the plan of rehousing the poor who have been evicted from the slums is being speeded up,
(c) the cost of rehousing the poor has decreased and
(d) overcrowding in strategic places of commercial importance has declined, thereby protecting the environment

(5) **Assurance of Minimum Wages :**

A Labour Ministry study in 1950-51 revealed that agricultural labourers could find employment for an average of 218 days a year, female agricultural labourers worked for only 34 days a year and were therefore out of work for more than half of the year Thus unemployment along with underemployment has depressed income of wage earners Even during the five-year plans there were often as may as 5 million unemployed workers This coupled with the existing inflation caused a reduction in the standard of living of workers for which most of them were already below the poverty level Capital accumulation was often wasted in speculation, money lending and increased ownership of personal property and thus was not providing new opportunities for employment and a rise in wages.

In the past slowness in enforcing laws which fix ceilings to agricultural holdings and the conditions in which they were applied resulted in no gains for raising the agricultural wages. At present, the governmental grants of moreland to the landless would not only improve their lot but would raise the general level of wages. A recent legislation legally establishes an increase in minimum wages of field workers. Such current economic efforts to combat poverty and unemployment, must again be brought about by a new accepted form of economic descipline


(6) **Ban on Indigenous Money Lending**

Most lending operations in rural India have been highly detrimental to productive capital accumulation However, their effects in the past were generally underestimated. First, the high interest rate has tended to increase poverty among the peasants and second the money borrowed is often used for usury rather than production[19]. In addition, rural money lending opperations have also caused a drain on urban capital formation In states such as Bihar and Orissa indigenous bankers have lent money to grain merchants and advanced directly to "ryats"—who in turn had easy access to towns. Thus indigenous bankers indirectly financed agriculture by financing internal trade [20]

Final liberation of the agrarian population from dependence upon exploitive money lenders came when several Indian states declared moratoria on indigenous debts. Nearly 65 per cent of the rural populace owed a total of £ 7 billion to private money lenders. With the assistance from the World Bank a number of new measures have been undertaken like-the increase in the number village banks and the provision of easy terms for financing agricultural development, have all helped to increase the liquidity of the rural population.

(7) **A Nationwide Network of Power and Irrigation Facilities :**

Performance of Indian agriculturel [...] sults than expected. Certainly one reason must be the lack and failure of technical considerations as well as social considerations of production. For example, the minor irrigation projects have experienced a lag in proficiency because of the opposition from private property owners and because the land is often divided into large number of strips. And how the water is shared often depended on the social influence of the land owner concerned; the wealthy landowners often getting a more than regular and more plentiful water supply. Also the wealthy landowners would support water projects which benefitted their property by opposed projects which would benefit properties of other hundreds of small land owners and yet had to cross their lands. Thus, the rich could ensure themselves with a plentiful supply of water while others would lose interest since there was no collective effort to maintain and support an irrigation network with an equal distribution of water [22]

The Indian government has recently assumed far reaching powers which have put an end to provincialism with regard to sharing of water and power supplies A nationwide network of irrigation and power has replaced individual state systems which often led to arbitration and long delays. Under the new network 13 million acres of land will get increased utilization of ground water. The severe shortages of power and water can be avoided by a more equitable distribution.[23]

Besides the inequitable power distributions, the Indian economy has in the past been plagued by the shortage of power. Since June 1975, special efforts have been made by government to recognize such deficiencies and special emphasis has been given to the generation of more power Since this time the generation of power by both thermal and hydro units has increased by 15 per cent.[24] The total energy production by difference sources has increased from nearly 22,000 KW to about 25,000 MW. As a result of an increased and uninterrupted energy supply industrial and agricultural production can increase considerably in the future.

(8) **Encouragement of Small Scale Industry**

In 1950 over half of India's industrial production came from small scale industries and by 1964 this had decreased to about 37 per cent.[25] However, the number of small

scale units with investments below £ 100,000 has increased from 36,000 in 1961 to 320,000 in 1972, employing over 4 million people and producing goods worth £ 8 billion.[26] In India, the importance of adopting intermediate technology for Indian conditions has been underlined very often. Official attitude was that small scale industries should underto, considerable development especially in the field of handicrafts and village industries. This is closely related to the Gandhian concept of ruralization and steps from hostility towards urban development and concentration of economic power. It is easier to increase employment by favouring small industry rather than by expanding large scale industry. Since the former requires more man power and demands a smaller investment per worker.[27]

The development of small scale and agro-based industries are an important aspect of the development in villages where more than 70 per cent of the population lives In villages it is required that people should be able to produce within the village system. It is difficult to provide more and more employment by a process of mechanized industrialization at least not in the immediate future Therefore, it is necessary that India continues to attach high priority to this employment oriented section of industry.

The recent methods used to encourage small scale industry are in accordance with the concept of its utility by following a policy of 'internal protection' i.e. by forbiding the expansion of urban modern industries; provision of subsidies, financial aid and tax rebates, etc. This has reversed the trend of development of small scale industries from towns to rural areas where they serve the need of villages. There are other measures used to ensure a nation wide flow of progress of small scale industries in order to eliminate regional inequities. The new emphasis is to develop agro-based industries in villages and the trend toward 'ruralization' has helped to exploit resources in the villages. As a result the domestic markets can expand and potential sources for capital accumulation open up.

(9) **Action Against Uneconomic Strikes:**

One method for approximating the decline in the production of large industries is to calculate the number of man-days lost due to strikes. This measure is a proxy for the production lost due to strike activities. This method may not be entirely satisfactory but it gives some indication as to the impact strikes have on production.[28] There were about 400 strikes a year after the Second World War with a loss of production of 5 to 9 million working days. The trend over a period of time has been towards a greater strike activity[29] During 1973-74 a sporadic rail way strike nearly crippled the Indian economy. In addition there were series of strikes in the public sector all of which resulted in heavy losses due to the operation of negative linkages and multipliers in the national economy. A series of new legislations passed recently by the Indian Parliament are an attempt to reduce the number of lockouts and wildcat strikes. Assessment of the impact of these measurements is difficult because of the time frame however, it is expected that industrial production will stabilize and thus overall industrial production will increase.

(10) **Rise in General Economic Growth :**

India along with the rest of the world was caught in the inflationary spiral of 1973-74. This coupled with simultaneous droughts in 1973 and 1974 depleted India's buffer stock of 9 million tons of food grains. Then a rise in world oil prices that hit India even more harshly as she has to import oil, industrial materials and fertilizers. With all these problems and setbacks, the Indian economy has been experiencing a growth rate of about 5 per cent during the 1975-76 year. In addition there has been an improvement in industrial and food sectors, two vital sectors to the Indian economy. The other economic indicators have also shown considerable improvement. For example, foreign exchange remittance has increased and despite a large trade deficit, India's foreign exchange reserves are in a relatively good position. Also tax realizations both direct and indirect, have greatly improved. Production in the public sector has increased during 1975-76 and is expected to continue to generate additional internal resources.[30]

(11) **Increase in Food Production**

It is generally recognized that inflation can be checked only through a sustained increase in production in both the agricultural and industrial sectors. The agricultural sector is of dual importance since it not only provides necessary food grains but also provides raw materials required for industrial production. Also is obvious that if India has to me her food needs, agriculture has t be modernized so as to increas productivity in relation to land an manpower. Such increases in pro ductivity can be brought about wit larger application of fertilizers, greater use of pesticides, regulatio of water use, provision of roads markets, storage warehouses etc The economic program embarke by India in 1975 envisages that fiv million additional hctares be brough under cultivation in the next fiv years. In addition, the network o irrigation was stepped up and plans were made for improving the production of fertilizers. With all these factors combined and with a satisfactory monsoon, the productin of food grains is expected to reach a record of 116 million tons this year. This is about 2 million tons over the target for the current year. This can be expected to grow substantially, particularly in the long run In fact, India will be able to build buffer stocks and become less dependent upon foreign supplies.

(12) **Increase in Industrial Production**

Before independence, most of the the industry in India was confined only to light industries — mainly cotton textiles, jute, sugar and paper etc. India's Second Five-Year Plan marked the beginning of a real industrial revolution. Between 1955 and 1960 industrial output increased by 38 per cent. Though there have been some notable gaps in the fulfillment of the plan programs of industrial development, the overall growth rate of industry has been 6.1 per cent.[31] The broad strategy of growth led to a significant change in the structure of Indian industry during the decade of 1960-1970.

The above achievements however, were slowed down by several socio-economic problems in the early 1970's. Industrial production was at a virtual standstill for the years prior to 1975.[32] Industrial output went up 4.5 per cent during the 1975-76 year. The industrial production has increased by 9 per cent in the first five months of 1976, against 2 percent for the pcorressrding period in a1975. There one, since 1975 great progresshasbeen achieved in the area of industrial development. Steel, coal and sugar are just a few industries which have shown a substanial growth. At least party this growth is brought about by the fact that at present

both labour and management are more disciplined and both of them relize their economic responsibilities.

Accelraring industrial growth is imperative for improving the backwardness of several of the Indian states, for providing continuous employment and a constant growth-rate. Governmental efforts in the past year have been and will continue to be vital for achieving such balanced industrial growth.

(13) Tune Up of Civil Administration

In contrast to former Parkinsion practices, the hordes of Indian bureaucrats now seem to be arriving punctually for work and taking a greater sense of pride in their work — despite restrictions on overtime pay.[33] The trained manpower in the bureaucracy can be made to function in yet a still more efficient manner through an acceptance of the concept of work and efficiency. The optimal functioning of the civildom is a necessary precondition for development — since greater part of the Indian economic activity lies in public sector

(14) Increase in Exports

In order for the country to be self-sufficient greater importance should be attached to the export sector of the economy. Also with rising standards of living, growing industrialization compartive cost advantage ads complimentarity in production of primary commodities and manufactures, there-by creating immense scope for larger commodity exchanges and supply of services. Recently India has announced several measures to simplify export procedures In addition, cash incentives have been suggested as inducement for exporters as a long run measure. In regard to the import policy for the country, import replenishment rates have been established for a number of non traditional products so as to strengthen the production base and the incentive for export.

The export statistics for the period 1975-76 have improved compared with the past years, however, the long run scope for improvement is immense as the Indian economy seeks to become more efficient and effective in the future. The statistics for engineering exports are more impressive as Indian engineering exports increased from £ 216.66 million two years ago to £ 444.44 million in 1975-76. What is more important is the fact that the production composition of India's engineering exports is gradually changing with a much higher proportion of it being capital equipment and turn key products. There is still immense scope for increasing engineering exports.

IV. To Sum Up

Discipline is an element of all human activity. The concept of discipline for an economic system defines the standards, norms, the procedures and processes accepted within an economy. It implies a framework, a set of objectives by which a proposed economic action may be measured and its costs assessed, a set of standards by which account may be taken of other people's economic capacity and productive power of a nation as a whole.

There are many glaring imbalances in the economics of "Third World" nations unemployed and underemployed resources, difficulties in balance of payments and a variety of bottlenecks which impede production and distribution Development planning seeks to breakdown these structural obstacles which hinder growth The problem becomes more aggravated because the aim is to achieve revolutionary changes without bearing the often very high social costs like — exploitation, overcrowding, misery, slums — which accompany economic progress in most cases. Thus the central purpose of development is to bring about social and cultural change so as to increase the production of goods and services which constitute the national income. A precondition for such a change is to *discipline the citizenry* towards the concept of *efficient work and optimal utilization of scarce resources* to attain rapid growth.

The concept of discipline in the Indian economy is unique since India recently decided that the economy could not longer continue without a redifinition of discipline. It has been the case that this discipline had to be imposed upon the people, usually for their benefit. However, this study has presented evidence that the result of this imposed discipline will be a more productive and equitable economic system which besttow benefits upon the entire Indian population

Inflation and Planning

MAHESH VARMA

A long period of economic stagnation, against a background of increasing pressure of population, followed by the burdens of the Second World War, had weakened the Indian economy. There was widespread poverty and want. The partition of the country uprooted millions of people and dislocated economic life. Productivity in agriculture and industry stood at a low level. In relation to needs the available domestic savings were altogether meagre. The promise of freedom could only be redeemed if the economic foundations were greatly strengthened. The constitution established equal rights of citizenship, and these had now to be expressed through rising levels of living and greater opportunities for the bulk of the people. It was essential to re-build the rural economy, to lay the foundation of industrial and scientific progress, and to expand education and other social services. These called for planning on a national scale, encompassing all aspects of economic and social life, for efforts to mobilize resources, to determine priorities and goals and also to create a widespread outlook of change and technological progress.

THERE ARE SEVERAL arguments against inflation. Inflation is not conductive to, and, on the contrary, is detrimental to economic growth. That is why, at first, it has been argued that a very rapid rate of inflation may be necessary to effect a significant increase in the real rate of voluntary saving through inflationary re-distribution. Second, the crux of the pro-inflation argument is the alleged high propensity to some of the groups benefiting most from inflation Third, it is arguable that a degree of inflation of the order postulated by Prof. Kaldor, and Prof. Lewis, may actually cause a diminition in voluntary domestic saving as a result of loss of confidence in the monetary unit, and a possible net reduction in the rate of total voluntary plus forced saving. Fourth, inflation may cause saving to be directed into non-productive and highly liquid forms of investment. It has been suggested that the windfall profits and capital gains of inflation broaden the scope for profitable investment in areas where use benefits are low and 'ownership benefits' high, such as in Gold hoarding, the acquisition of certain types of real estate, inventories and foreign assets. Fifth, inflation might have a serious effect on the flow of foreign capital to India, and might encourage a flight of foreign and domestic capital. Sixth, it is likely that inflation will hinder the expansion and the diversification of exports. The Third Five Year Plan also drew specific attention to the danger of inflation in India in this regard.

Shri Varma is Research Scholar, Economics Department, Aligarh University.

In regard to the Pro and Anti-arguments of inflation, a substantial quantity of statistical material is available on the relationship of growth and inflation in developing countries, like India, since 1945. The conclusions of these studies are that, beyond a moderate rate of price increase, upto a maximum annual rate of 5 per cent, the rate of growth of income has been inversely related to the rate of inflation.

A growing economy, such as ours, must have sufficient flexibility in its price structure in which growth is most rapid. Consequently, the Third Plan has recognised this situation by stating that price policy must ensure that the movements of relative prices accord with the priorities and targets set in the plan

Now, the tax policy to control inflation will have to be directed both to the level and composition of aggregate demand and to problems on the supply side such as inelasticity of food supply, relative immobility of resources, and scarcity of skilled labour. Policy oriented to supply problems should be geared, first to promoting increased agriculturl productivity, and, second, to the provision of tax incentives for labour to work, particularly in key occupations, for firms to operate efficiently and at optimum output in terms of planning goals, and for the transfer of resources toward most desirable activities—in short toward the elimination of supply inelasticities, and the, promotion of increased factor mobility. Conventional fiscal policy for stabilization operates on the level of spending. Tax policy under this head may be either automatic or discretionary.

In India there are very limited coverages and relatively low elasticity of the present personal income tax which limit the usefulness of the income tax as a tool of built-in flexibility. Although modifications in the rate structure and coverage should increase the responsiveness of the income tax to aggregate income changes, the major onus of providing built-in-flexibility in the immediate future must develop towards indirect taxation. Indirect taxes have a wide base and elasticity studies suggest that revenue is surprisingly responsive to income changes. However, built-in flexibility in indirect taxation, is at best an imprecised and unreliable factor owing to changes in taste, and fashions etc. In this manner a mix of direct and indirect tax measures would be employed to excercise a maximum inhibitory effect on consumption spending and a minimum inhibitory effect on investmnet spending. The final object of a development-oriented stabilization policy in India should thus be to control non-functional instability by means which have a minimal inhibitory effect on productive investment.

As regards the Anti-Inflationary taxation, one of the fundamental principles underlying workers' management is distribution of income according to work performed. In an unregulated market income per worker will vary widely from industry to industry. For the same work in different industries personal income may differ upto 100 per cent. There is no problem if income

differs among the firms within the same industry; these differences reflect differences in quantity and quality of work and of entrepreneurial activities of working collectives, but if differences are large among industries, the causes of differences are obviously unrelated to the work performed since for statistical reasons it is unlikely that an entire industry has only good workers and another one only bad workers. Since there is a strong social pressure that rewards be commensurate with work performance, workers in underprivileged industries will increase their wages in order to catch up with their colleagues in the more prosperous industries. In order to be able to do that, they will increase prices, and that is the beginning of an inflationary spiral which never stops. It is clear that price control, restrictive monetary policy and other orthodox measures can not be used to combat the type of inflation just described The source of inflation is not only in the rise of personal incomes but in the already attained level of personal incomes in privileged industries because of which there appears a so-called demonstration effect. Therefore, in addition to the rise of personal incomes an, above standard, level of personal incomes should be taxed. Economic control of incomes will make possible the elimination of administrative control of prices.

The First Plan took over several projects, which had been worked out earlier and integrated them in a well-knit scheme of economic and social development embracing every part of the country through its emphasis on agriculture, irrigation, power, and transport. The plan aimed at creating the base for more rapid economic and industrial advance in the future. In stressing the place of social change and institutional reforms in the economic development of the country, the plan initiated some of the basic policies which were further developed under the Second Plan. The completion of Second Plan in March 1961 marked also the end of the first decade of India's planned development During this decade there has been rapid expansion of the Indian Economy, the outlines of the country's future-social and economic structure-have been established, and foundations have been laid for the achievement of the basic objectives and the long term economic goals set out in the Plan. As a result of economic planning, there was a substantial increase in the role of investment especially in directions calculated to accelerate the economic development of the country.

Apart from the general improvement in the economic situation, the assessment of resources for the plans have taken into account the award of the Fifth Finance Commission, the nationalisation of 14 major Commercial Banks, acceleration in their branches, expansion and deposit mobilization, particularly in rural areas, re-orientation of investment of policies of the Life Insurance Corporation of India, and the Employees Provident Fund, and the more recent trends in receipts and expenditures of public authorities. This assessment has been made in consultation with the Central and State Governments, Reserve Bank of India, Life Insurance Corporation of India, Provident Fund Commissioner and the undertakings of the Central and State Governments. The scheme of financing the plans now envisaged marks a distinct departure from that in the Third Plan and the Three Annual Plans. It has been specially designed to serve the objective of growth with stability and promote progress towards Self-Reliance.

The recent economic growth, for which the momentum was given by the all-round discipline in the wake of the Emergency proclaimed more than a year ago, augurs well for setting the Indian Economy on the way of sustained growth after many years of stagnation, After controlling the inflationary trend and enforcing a strict regime of price stability the economy is taking up threads of long-term economic development in a more congenial atmosphere than when the Fifth Plan was launched. The success achieved by the country in overcoming the grave economic crisis of 1972-74, characterised by stagnation, is an indication of its capacity to grapple effectively with crisis situations. The declining trend of prices during 1974-75 and 1975-76, the highly favourable prospects for economic growth in future, and the much greater emphasis on economic discipline since the launching of the NEW ECONOMIC PROGRAMME has now cleared the decks for the pursuit of a more purposeful growth-oriented strategy.

However challenging the tasks of planning for and maintaining a steady growth trend at the rate of 5 to 6 per cent per annum. the economy will face them with better confidence, than at any-time in the past years The first two years of the Fifth Five Year Plan had helped to stabilise the economy and strengthened the base for launching on a mere purposeful development strategy for the rest of the decade and the early Eighties.

One can hardly over-emphasise the vital role of an adequate mobilization of domestic savings for any meaningful resumption of an orderly growth process. Judging by past experience, excessive reliance on deficit financing for increased public sector outlays can be

Tendency of the Price During the Plan Periods

Source: Reserve Bank of India, 'Price Trends During the three plan periods' Reserve Bank of India Bulletin, June 1967, Reports on Currency & Finance, 1950-51, pp. 147, 1961-62, pp. S17, 1968-69, pp. S26-27, and 1974-75, pp. 36-37.

counter productive and harmful. Our inability to mobilize adequate domestic resources in a non-inflationary manner has been a major weakness of our development process. As such, the acceleration of economic growth in a regime of price stability in the years to come is crucially dependent on our ability to work out new strategies for mobilising domestic savings

Public savings has a Key Role to play in rising the rate of investment, without accentuating inequalities in income and wealth. The continuance of compulsory deposits scheme has increased the purchasing power of rupee between 9 to 12 per cent in the various sectors. These deposits, are their savings invested at an attractive interest rate of 12.5 per cent, therefore, while they have saved for themselves, the purchasing power (real income) of the people has considerably improved.

The table below shows that during the year 1950-51 the National Income and Per Capita Income of Rs 9,530 crores and Rs 284 have increased to Rs 61,337 crore and Rs 340.1 and in percentage term there is an increase of 544 and 20 per cent in National Income and Per Capita Income respectively in the year 1973-74, i e on completion of Fourth Five Year Plan. It also indicates an equitable distribution of income and wealth. Keeping in view the growth of population from 361 million in 1950-51 to 574 2 millions in 1973-74, the indexes of Agricultural and Industrial productions are also showing an increasing trend from 96 and 100 to 131.6 and 200 6 respectively in 1973-74

Inflation and its role in Indian and the implementation of plans should be together taken. The best of plans can go wrong for lack of effective implementation. The Fifth Five Year Plan will be judged by the results that we achieve. There is imperative need to evolve an appropriate set of policies and procedures for implementation. The new directions given to development effort, the greater responsibilities assumed, and the magnitude of the tasks in certain vital sectors call for a consistent policy-frame tightly coordinated with implementation. The Plan, the policies, and their implementation must have the coherence and co-ordination of a well conceived military operation. The greatly enhanced outlays provided for in the Plan must not be allowed to be dissipated by inapropriate and uncoordinated policies and actions A necessary step in this direction is to translate the broad approach to the Plan into a detailed policy frame for implementation. It is proposed to devote concentrated attention during the next few months towards working out a consistent policy-frame encompassing agricultural policy, industrial policy, price-wage-incomes policy, policy for resources mobilisation, policy for regional balance in development, and management policies

At the present pace of project formulation, the scope for any such choice seems limited. In fact, in several long-gestation fields, not even as many well-worked out projects may be available as need to be included in the Plan One of the reasons for the poor performance of several key sectors in the Fourth Five Year Plan is that preparation and evaluation of projects and issue of sections was undertaken much after the Plan had been finalised and the projects concerned had been included in it. This experience must not be repeated. The Planning Commission should also keep a watch over this and monitor their progress closely. This is the most important follow-up action that needs to be taken as a matter of high priority. Hence improved project preparation will make for economy and speed in construction, and other policies, and measures would also be necessary, i .e , proper sequencing of projects so as to avoid bunching, avoidance of dispersal of financial and physical resources involved in taking up too many projects simultaneously, expeditious finalisation of arrangements for meeting the rupee, and foreign exchange costs, promotion of efficient construction organisation techniques and management practices, co-ordination, techniques and management practices, coordinated execution of interrelated phases, and elimination of bottlenecks in the supply and movement of construction material and equipment There is also a need for proper balance between the claims of indigenisation and considerations of speedy implementation.

As regards the proper utilisation of capacity of resources, the under-utilisation of capacity means so much waste of resources of the nation. It is particularly regrettable when the industries affected are those catering to the needs of essential consumption, high priority investment, exports and import substitution At present, the problem affects a substantial segment of the economy including such key and essential fields as Iron and Steel, non-cooking coal, fertilisers, engineering goods, power and oil transport, sugar, and irrigation. The Fifth Plan assumes a reasonable rate of capacity utilisation, particularly in sectors producing essential goods and services It can be noted here without any fear that bold initiatives are needed in institution building, policy making, and the adoption of procedures to create and utilise capacities in the key and essential fields An important factor for under utilisation of capacity is the emergence and persistence of inter-sectoral disproportions. Imbalances within individual enterprises are also a factor for under-utilisation of capacity. All these disproportions reflect weaknesses in planning, andefforts must be made for removing these weaknesses of our Planning growth.

Neyveli Lignite Co

Back on its Feet A

THE RETURN of the prodigal son is always an occasion for joy and happiness. So is the eturn of a public sector undertakig to lines of profitability. It is thereore good news for the people in eneral and the champions of the ublic sector in particular that the Neyveli Lignite Corporation has urned the corner. This key public ector project with a capital base f 160 crores rupees had accumulatd a loss of eighty crore rupees over he last 20 years and the nominal rofit of four crore rupees which he undertaking expects to make this ear is the first flicker of hope that he project will survive Not long go, just in 1972, the corporation vas in deep trouble with lignite production and power generation at he lowest ebb That year alone the oss was 14 crore rupees It was ecided to change the management nd the present team took over towards the end of 1972.

Two major reasons are responsible or the decline of this prestigious roject. The one was technical and he other concerned labour-management relations Any objective assessment of the situation would reveal he injection of extraneous political factors into the labour management relations subsequent to 1967 Here is a text book example of how party in power with little or no hold on the labour movement can, it minds, seek to secure its hold n the labour by the strength of its political position to the detriment of the health of a major development project. According to Shri Srinivasan, Chief Personnel Manager of NIC the crisis was precipitated by the active interference of the party in power with the labour movement. An atmosphere of frenzy and tension developed in the mine and factory site and frayed tempers were the order of the day. The supervisory staff and technicians responssible for upkeep and maintenance were abused and assaulted. There was go slow and overtime was demanded for overtime sake. The bill went upto Rs 25 lakh in 1972. Lignite production which once touched 4 2 million tonnes slided to less than three million tonnes. It was found that while the large number of the eighteen thousand and odd workers were more concerned with assured wages, a handful of less than a hundred employees held the nation's prime mover to ransom Any action against any one of them would spark off a crisis and result in a strike Thanks to the emergency the management was able to weed out these dangerous elements and restore calm and amity in the mine and the factory.

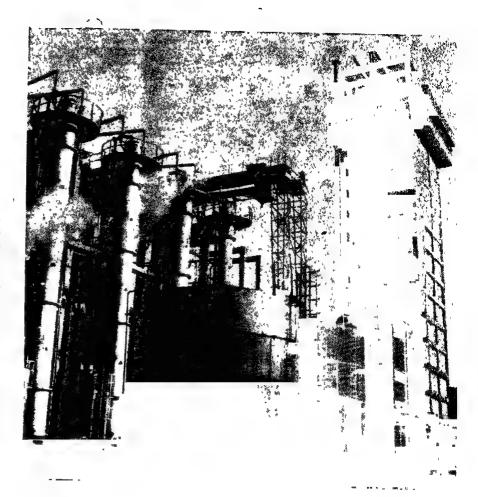
The Lignite Project at Neyveli into which Rs. 160 crores have gone, had accumulated a loss of over 8 crores of rupees in the last 20 years of its working. There was a time when it was teetering between life and death. But it is slowly coming back to life, as a result of strong measures taken recently. The future of Tamil Nadu is closely bound up with the future of this multi-purpose project.

Hard soil excavated upto 70 metres is being moved out.

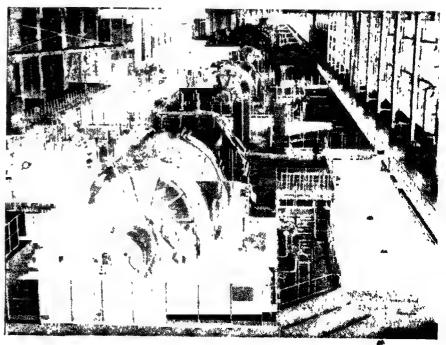
The other problem — technical-was equally serious if not destructive. The Neyveli Lignite Corporation was conceived as a composite project consisting of an open cast mine for lignite, a six hundred megawatt thermal station, a briqueting and carbonisation plant for the production of leco and other by-products and fertiliser plant producing urea With very few open cast mines having continuous mining equipment in operation in the world the choice of technology was limited to the West German one and the very first step the Neyveli Lignite Corporation took seems to have gone wrong. The giant bucket wheel excavators and the conveyor belts imported from West Germany were designed to mine and carry 6.1 million tonnes of lignite. According to the present management the excava-

ation

T. G. NALLAMUTHU

tors came across hard soil in Neyveli and therefore their capacity was badly affected The conveyor belts were also affected. Because of this the average lignite production was around 3.2 million tonnes as against 6.1 million tonnes. Only once did it reach 4 2 million tonnes. The thermal plant was designed to break even around 60 per cent efficiency but the fertiliser plant and the leco plant could break even only at a very high capacity utilisation. When the lignite production fell, it not only affected the thermal plant but it also affected the other two very badly. The problem was compounded by the fact that solid fuel gasification technology used by the fertiliser plant became obsolete and the Corporation suffered Rs 75 per tonne of urea produced. On the thermal side two of the nine units were converted to fuel oil base to overcome lignite shortage. It is from here the new management is trying to extricate the Corporation. In the last few years and particularly in the last few months concerted steps have been taken to increase lignite production and the result is 3.8 million tonnes, eight hundred thousand tonnes more than last year. With this the thermal plant has been worked to 58 per cent capacity producing 2,850 million units of power. The other two units are worked with minimum input so as as not to damage the equipment and keep the labour idle. According to the Chairman of the Corporation, Mr. Yegneswaran the present equipment and machinery cannot help increase production beyond 3.8 million tonnes. Therefore government have sancioned an expansion scheme which will bear fruit in 1980-81. The Rs 87 crore scheme means the installation of three sets of equipment each consisting of a bucket wheel excavator, conveyor and spreader. These equipment will help replace the existing ones and increase the capacity to 6.5 million tonnes by 1980-81. That will be the day when the project will realise its goal, because only then the leco


A part of the Lignite production goes to produce urea.

Lignite heats up boilers and the steam turns the Turbines, the generators produce power.


In a matter of minutes the excavators dig at one end and fill up excavations at the other

The final journey—towards power, leco and fertiliser

Giant bucket wheel excavators digging on black gold.

plant and the fertiliser plant can work to full capacity. Meanwhile the lignite based fertiliser plant is being converted to oil base so that the available lignite can be used in the oil fired boilers in the thermal plant.

The present Rs 87 crore expansion is only a short term remedy. With power shortage in Tamilnadu increasing year after year there is demand to set up a superthermal plant near Neyveli preceded by the second mine cut. The Corporation has already prepared a feasibility report for a 3000 MW station based on a seven million tonne lignite production. This according to Mr. Yegneswaran will cost Rs 650 crores, one hundred to one hundred twenty crore rupees more than required to set up a similar size thermal station based on coal at the pit head. But looking at the requirements of Tamilnadu which is already facing a shortage of 1000 MWs, a 1000 MW power station outside the state will yield only 900 MW after transmission. Besides with very little coal reserves to go by, we may have to have a second look at lignite in the future. At that time the cost of putting up a thermal plant near Neyveli will be very high, according to Mr. Yegneswaran. Meanwhile the Tamilnadu Government has set up a study team to consider the feasibility of setting up a thermal plant near Neyveli initially based on coal moved through the neighbourin Cuddalore port and then at a late stage will be switched over to lignite It will take three months for th team to report and a few mor months for the Tamilnadu Govern ment to take a decision Till tha time people in Tamilnadu and th rest of the country can be guardedl happy that the Neyveli Lignite Cor poration has come out of the red. ☐

WORKERS PARTICIPATION IN MANAGEMENT

ASOK GHOSH

EVEN AT THE risk of being branded as a romantic idealist, I perceive an actualisation of the lofty Philadelphia declaration of ILO: 'Labour is not a commodity' in the professed State policy of Workers' Participation in Industry enjoying a pride of place in the Prime Minister's 20-point economic programme. The sceptic would readily retort: What's so novel in the scheme—is it not an extension of the "Works Committee" concept of the industrial legality and is it not bound to meet the same ritualistic fate? To him my humble submission would be that there is a basic difference in the approach itself: the socio-economic forces released by the promulgation of emergency have generated an all-round sense of responsibility, awareness and involvement for productive pursuits; as a consequence, both labour and management have espoused the new scheme of workers' participation with emotional investment which was conspicuously absent in the case of the works committees.

Conceptually, the theory of participative management is based on dysfunctionality of the bureaucratic and Taylorian work-organisation on the one hand and on the other recognition of certain socio-psychological needs of the individual at the work-situation. This perhaps requires some elucidation which is offered below.

A bureaucratic system assumes (a) the corporate task can be successively split into smaller and smaller independent parts and (b) each unit or person should be allocated exclusively a single task-element. The consequences that follow are: (a) a single structure of relationship between units or persons i.e. superior-subordinate relationship; (b) a single demarcated functional boundary for each unit or person; (c) decision making is split from task-performance; (d) the top level is left with only decision-making and the bottom level is left with only task-performance. The fallacy of the assumptions and the inconsistency of the consequences with human motivation are quite obvious.

The behaviorist believes that man is a creature with great potential and is constantly in search of ways to develop himself. He naturally brings this aspect of himself to the work-place and expects his work and work-related experience to satisfy his development needs. Some such important needs are: (1) the need for the content of a job to be reasonably demanding of the worker in terms other than sheer endurance, and yet to provide a minimum of variety, (ii) the need to be able to learn on the job and to go on learning; (iii) the need for some minimal area of decision-making that the individual can call his own; (iv) the need for some minimal degree of social support and recognition in the work-place; (v) the need that the job leads to some sort of desirable future. According to the behaviorist the worker invests his energy and commitment to work directly in proportion to the degree to which he perceives his work and work-environment to satisfy his needs. The participative management seeks to integrate individual needs of development with corporate needs of productive operation and thus ensures that the same activities lead to both maximum organisational effectiveness and maximum need-satisfaction of the workers.

Underlying any scheme of workers' participation are two basic ideas: that there are two distinct groups of people in an enterprise – managers and workers, and that there are two exclusive sets of functions – managerial and operative. Managers are responsible for the work of their subordinates i.e., 'workers' who are accountable only for their own work. Managerial functions are essentially concerned with planning, organising, motivating and controlling in contrast with 'doing' or operative work. The workers' participation in management seeks to bridge this gap by authorising workers to take part in managerial functions. Theoretically, there may be three different forms of participation:

(a) *ascending participatio[n]* Workers may be given opportunity to infl[uence] managerial decisions at [higher] levels through their el[ected] representatives to W[orks] Councils or the Boar[d of] Directors. This may be [called] integrative participatio[n or] co-determination, as in Germany.

(b) *descending participatio[n]* Workers may be given power to plan and mak[e de]cisions about their own [work] i.e. delegation and jo[b en]richment, as in Swede[n and] Norway.

(c) *disjunctive participatio[n]* Workers may parti[cipate] through collective-ba[rgain]ing.

The scheme that has been [intro]duced in the country by the G[overn]ment of India, Ministry of L[abour] Resolution dated 30th October, takes the form of descending [parti]cipation as analysed above. T[o my] mind, in the socio-economic co[ntext] of our country this is by far th[e best] and most pragmatic approa[ch to] industrial democracy. Much [has] already been discussed by the [Go]vernment spokesmen, journ[alists,] labour leaders and profess[ionals] about the provisions in the sc[heme] and as such I don't propose to [dwell] on this aspect. In short, the sc[heme] is inherently flexible to acco[mmo]date varied situations in di[fferent] industries and basically pres[ents a] two-tier model: shop counc[ils at] the shop levels and joint coun[cils at] the enterprise levels. The co[uncils] are constituted by equal repre[senta]tives of workers and manageme[nt;] decisions in the councils are [taken] on the basis of consensus. The [areas] to be covered by the counci[ls are] production-planning, produ[ctivity,] welfare and safety measures, [deve]lopment of skills of workers, [work] environment and the like. [While] initially the scheme was appl[icable] to units employing 500 or [more] workers in manufacturing an[d min]ing industries, it is now made [appli]cable to units employing 100 o[r more] workers in commercial and s[ervice] organisations as well.

The factors on which the s[uccess] of a participation scheme de[pends] may be divided into situation[al and] human factors. While the situa[tional] factors like autonomy of an [enter]prise, size of an enterprise, str[ucture] of an enterprise and techn[ology,] terms and conditions of work [deter]mine the participation pot[ential]

Shri Ghosh is Personnel Manager of the Jute Corporation of India, Calcutta.

the human factors like workers' propensity to participate and management's acceptance of their participation determine how far this potential can be translated into reality. To these a third dimension may be added – role of the social scientist in creating appropriate social culture and social environment.

Shri Raghunath Reddy, Union Labour Minister, to a press conference on 5th January, 1977 announced that the scheme for Workers' Participation in Industry was received well both by labour and management. As an illustration, he quoted that till date the scheme was introduced in 472 establishments in the central sphere comprising 247 in the mining sector, 188 in the manufacturing sector and 37 in the departmental undertakings. In addition, the scheme was reported to have been implemented in more than 1000 units in various States. With its encouraging success in mining and manufacturing industries, the scheme is now extended to service and commercial establishments in units having a minimum work-force of 100. Shri Reddy also referred to the recent amendment of the Constitution which provided that the State would take steps by legislation or in other ways to secure workers' participation in management of undertakings, establishments or other organisations engaged in any industry.

So far as the state of West Bengal is concerned, the record is quite impressive. On the basis of the reports available till the end of December, 1976, the scheme has been implemented in 180 establishments of which 45 are in the public sector (central sphere), 5 are in the public sector (State sphere) and 130 are in the private sector. Out of the 8.8 lakh factory workers in the State, about 5 lakh workers are presently participating in management of the industry.

It is heartening to note that the scheme has not only made a quantitative impact but a qualitative impact as well. The spectacular rise in industrial productivity and marked improvement in industrial relations atmosphere are eloquent testimonies in this respect

I hasten to add at the same time that the workers' participation scheme may not be seen as an alternative to industrial disputes mechanism. In fact, for durable and meaningful operation of the workers' participation machinery, there should be a concurrent effective industrial disputes machinery. The former takes care of the co-operation aspect of labour-management relations while the latter deals with the conflict aspect. Any attempt to combine the two aspects into one instrumentality will frustrate the purpose. To be more specific, issues of vital concern to the workers may be distinguished as work-related and interest related The stategies to deal with the two distinct groups of issues should be necessarily different. Logically, the forums also should be different—one for joint problem-solving and the other for distributive bargaining. Our industrial relations approach so far has been based on the seemingly plausible but fallacious assumption that economic calculus is the only material basis of bipartite relations. The scheme for workers' participation recognises the fact that humanisation of work and job enrichment consequent upon re-design of work-structure, work-system and work-procedure on small group-norms is in itself a great motivational force While an effective bargaining machinery will reduce the area of conflicts, workers' participation scheme will act as a parallel instrument for the creation of work-culture and work-commitment, so vital for productive pursuits in a country like India which has accepted socialism as the ultimate goal. □

INFLATION AND PLANNING

(*Contd. from Page 19*)

The accelerated planning growth and a pattern of economic development weighted in favour of basic industries, agriculture, and social services require a basic change in the administrative structure and the leisurely procedures are incompatible with the fulfilment of the Plan tasks, hence attention needs to be given towards evolving an administrative set-up, and modes of functioning which can meet the challenge of the Plan.

A growing economy like India, must have sufficient flexibility in its price structure in which growth is most rapid. Hence, the inflation, adopted for the promotion of economic development, will be self-destructive due to the re-distribution of voluntary savings which will rapidly catch-up with investment. The price rise will also be halted when the additional out put of consumer goods made possible by the capital formation begins to reach in the market under all round *Economic Discipline*, and the Fifth Five Year Plan is much more than an internally consistent mathematical exercise It is also conceived as the rallying point for a supreme national effort in a decisive phase of our struggle for a *Self Reliant* economy, and as well as for *Social Justice*. This struggle is another war that our country has to fight and win, a war on poverty, dependence, and stagnation, and in any war, there will be difficulties and set-backs, but it is necessary to push them ahead with determination without any doubts, wavering, and hesitation. Success in this worthy struggle calls for *Discipline, Hardwork*, and *Sacrifices* from all sections of the population. The Fifth Five Year *Plan* must be truely a *People's Plan* in every sense of the term. □

Yojana Quiz

1. What is Earth Pillar?
2. Do our Brains work while we sleep?
3. What is Marianne to the French?
4. What is Adam's Apple?
5. The Seychelles, a cluster of 92 islands in the Indian Ocean, became an independent republic on
   (*a*) 3 September, 1939
   (*b*) 9 August, 1942
   (*c*) 30 July, 1960
   (*d*) 29 June, 1976
6. Name the Parliaments of the following countries:
   (*a*) Nepal
   (*b*) Iran
   (*c*) Afghanistan
   (*d*) Burma
   (*e*) Norway
7. Is a fly stronger than a man, comparing their size?
8. First woman to climb Mt. Everest is:
   (*a*) Junko Tabei
   (*b*) Margaret Thatcher
   (*c*) Yuri Gagarin
9. What do the following abbreviations stand for:
   (*a*) IA
   (*b*) IAS
   (*c*) IAAS
10. Which project is a joint venture of Haryana, Punjab and Rajasthan?

Answers :

1. Earth Pillars are singular geological formations—clay capped by stones. They are found in the Austrian Tirol, and elsewhere, and consist of tall pillars of earth stuck full stones and each surmounted by a large block of rock. 2. One part of our brain is working always, whether we are asleep or not. 3. Marianne is a French Christian name which the people gave to the guillotine during the Revolution of 1789. In memory of what the gillotine meant to them the French kept the name of Marianne as a symbol of the Republic. 4. Adam's apple is the name given to the lump in the front of the neck where the throat is. It began with the old nonsense which said that a piece of the apple which Adam ate stuck in his throat, and made this curious lumps. 5. (*d*) 29 June, 1976. 6. (*a*) National Panchayat, (*b*) Majlis, (*c*) Shora, (*d*) Pyithu Hluttaw, (*e*) Storting 7. The answer is certainly yes. It is by skill, made not by the muscles but by the brain, that man lives on the Earth—Skill, not strength.

8. (*a*) Junko Tabei a Japanese houswife on 16th May, 1975.

9. (*a*) Indian Airlines, (*b*) Indian Administrative Service. (*c*) Indian Audit and Accounts Service. 10. Beas project. It consists of Beas--Sutlej link and Beas Dam at Pong.

Quotation Box

I believe in taking people into confidence while taking any decision about the country. This has been done in the past and shall be done in the future too.

—Indira Gandhi

Terrible loneliness is also a great poverty. The hunger for today is for love.

—Mother Teresa

I am glad I am not a politician.

—Raymond Barre
Prime Minister of France

Science indicates that man is no more than a chance product of evolutionary forces which was neither preordained nor responsive to his aspirations.

—Dr. Raja Ramanna
President
Indian National Science Academy

American intelligence has, to be sure, come a long way since Pearl Harbour—but mostly in the area of technique rather than that of judgement.

—Far Eastern Economic Review

The dog has been man's friend since time immemorial but now man has become its worst enemy.

—Rukmani Devi Arundale
Chairman,
Animal Welfare Board

We have a long way to go before we can reduce even the grosser forms of social, economic, cultural, educational and regional inequalities that we now find in our midst.

—B.D. Jatti,
The Acting President

The PNA (Pakistan National Alliance) specifically pledged enforcement of *Shariat*—abolition of interest on all loans, stoning to death for adultery, cutting off hands for theft and public flogging for consumption of alchohol. Judging from the talk in the streets, however, the electorate is more interested in less spiritual things like the cost of living, land distribution and nationalisation of industrial and commercial enterprises.

—Salamat Ali
in Far Eastern Economic Review

The Wall-to-Wall Challenge

Take a close look at the inner wall of a bazar tube Running along its length will be a weld ridge Along this ridge, dirt and suspended particles in the water collect and finally choke the tube. The tube wall is also thin You naturally pay less for this tube but it will cost you more in the long run because it will not last long

Examine an ITC tube, popularly known as TATA pipe No weld ridge. Because ITC tubes are made by the Fretz Moon Process which causes the weld edges to be perfectly fused. The wall of an ITC tube not only has a smooth inner finish for free flow of water, it is made thicker for greater durability. You pay more for right quality—for longer years of trouble-free service

The strength of your tubes lies in the wall thickness

Correct wall-thickness of ITC tubes—complying with the specification IS : 1239 (Part I)-1973 —enables threads to be cut to perfect form, leaving adequate metal at the root. This ensures strong, leak-proof joints and greater all-round durability.

Protected against corrosion

The duration of protection given by zinc varies directly with the thickness of the coating applied. ITC galvanised tubes (G. I. pipes) have a zinc coating that always meets the requirements of the specification.

Stress-free

ITC tubes, made by the Fretz Moon process, are free from any kind of stress since the forming, welding and sizing are done in the hot state. Being hot finished, ITC tubes can be cold bent.

ITC - the most trusted trade mark in steel tubes

Performance Budgeting

Key to Control in Nationalised Banks

DR. B. P. SHARMA

This paper seeks to discuss the framework of performance budgeting that the management has set up in the State Bank of India. In doing so the author also raises other relevant issues of interest to students of banking.

What is Performance Budgeting

In any rapidly expanding and progressive industry, the management has to plan ahead, lay down targets and goals at different managerial levels, evolve reliable and acceptable standards for ensuring performance vis-a-vis the targets and take corrective steps in cases of unusual divergence between expectation and performance. For this purpose and to maximise productivity, it is imperative to exploit, assimilate and apply fully the latest tools of managerial science. Truly speaking big industries like banking are in urgent need of budgeting, inspecting, costing, auditing and research[1] Towards this end, the establishment of systematic channels of performance budgeting has assumed significant importance. In simple terms performance budgeting "is primarily a planning and control system."[2] Further, "The common object of performance budgeting is to formulate policies aimed at an objective established after the consideration of the probable course of events in the future, and to provide a means for the constant comparision of actual progress towards this goal against the preconceived results."[3] Performance budget considers the matters extending over drawing up of a business plan furnishing adequate details on important aspects of the business and fixing targets in various fields of the business concern. The actual performance of each unit is evaluated periodically to ascertain the variation with budgeted levels, and appropriate corrective measures initiated in time to bring the performance in line with the planned growthlevel.

Pivotal Role

With the increasing intervention of the Government in the economic life of the nation to attain rapid growth based on social justice and self-reliance, it is worthwhile that the budgets of a public sector concern should serve a variety of objectives in addition to ensuring accountability and financial control. It is no longer adequate if the budget assists the executive in controlling the expenses or in ensuring that the instructions of the Government have been carried out In fact, the budget should serve the management in the execution, co-ordination and control of their different activities and plans and in taking correct decisions Mr. David Klein has aptly remarked: "It seems, therefore, better to plan the budget to meet a desired set out goals. This will force the planners to formulate explicit goals and design the budget in such a way as to help in attaining them"[4] What is more, it should assist the top executives to know what the organisation is performing, at what cost and with what consequences? What is needed most is that the budget should reflect the comprehensive programmes of the undertaking with detailed line of action. Budget should be an operational document which will translate long-term and annual plans into an action programme, integrating the financial as well as physical targets of each activity. It requires such budget which will not only demonstrate, who spends the money and on what item, but also include functions, programmes, activities and schemes to help determine effective and economical allocations for the programmes and projects. It means, function-cum-activity classification budget is urgent need of the hour which should be based on the organisational units with the objects of expenditure suitably woven into it. This approach to budgeting is the key note of a new technique in budgeting known as 'Performance Budgeting'[5]. The performance budget lays great stress on estimating the fiscal requirements as well as expending funds on the operating units Periodical reviews are conducted to observe how the performance matches with the budgeted claims of a unit and remedial actions initiated.

Banking and Performance Budgeting

The significant part that performance budgeting can play in banking requires no reiteration. In fact, the urgency for establishing performance budgeting in banks was never felt so keenly as after nationalisation of 14 major banks in July 1969. In the past, geographical spread of their offices was mainly confined to bigger cities and towns and the functions were of a routine nature without proper planning for credit and resource mobilisation. It will not be an exaggeration to say that in a tradition-bound banking system performance budgeting had a little significance In this context, Shri R K. Talwar, Ex-Chairman, State Bank of India rightly observed that "although budgeting is not a new concept in the industrial world, its application in commercial banking is quite recent even in foreign countries"[6] Even today the bank management in general is averse to recognise the importance of performance budgeting in its broader perspective in India. The Administrative Reforms Commission in its report submitted in 1968 recognised its potentiality as a tool of result-oriented administration and recommended its adoption at the earliest possible date in the public undertakings.[7]

Dr. Sharma is Senior Lecturer, Department of Post-Graduate Studies in Financial Management and Research, Raj Rishi College, Alwar.

Currently, budget is no longer regarded as a mere "statement of the needs and resources" of a bank or "a plan adjusting expenses during a certain period to the expected income for that period" but has come to be recognised as one of the most effective managerial tools of planning, coordinating, controlling and evaluating performance leading to remedial measures.[8] The orthodox concept of "imposed budgets" have been replaced by "participating budgets" and it is widely accepted that budgeting if practised in 'Sport spirit' should contribute crucially to managerial effectiveness, as well as harmonious inter-personal relations in bank management

A Guide to Action

The importance of budgetary control and performance budgeting can easily be judged from the views expressed by Banking Commission in its report submitted in 1972 The Commission correctly emphasised that "operational efficiency can be achieved through a proper planning of the year's activities sufficiently in advance and by fixing targets for performance and income, and limits for expenditure This requires preparation of budgets and establishment of a good system of budgetary control."[9] The performance budget is not an end in itself, rather it is a means to the end of work accomplished. For the sake of achieving better results, bankers should further analyse the targets in the light of the prevalent policies of the bank and the monetary authorities

In the sphere of banking, performance budget not only help in attaining targets but also ensures a direct control on different income and cost factors, probe into the causes for the deviations from targets and take remedial action if so desired Besides, it promotes a feeling of cost-consciousness and restricts expenditure to the bottom; inspires healthy competition between branches and aids in reviewing present policies and deciding future course of action.

Methodology of Performance Budgeting

Now the question arises what methodology should be adopted with regard to performance budgeting? Should we prepare budget for one-year or two years or five-years or ten years Broadly, a budget should cover three phases: (a) There could be a perspective budget covering, say, upto ten years indicating the broad pattern of growth envisaged (b) There could be a medium-term budget covering 3 to 5 years so as to provide a concrete shape and reality to the goals set (c) Then there could be one-year budget which essentially is a programme of action to be executed during the year ahead All these three tiers of budgets have their utility in a banking concern and one without the other, might lead to either lopsided budget without a concrete programme of execution Mr. Willsmore has appropriately remarked: "You cannot plan a business piecemeal."[10] For instance, it would be hard to put through a programme of action which extends beyond a period of one to two years, because several new developments and other imponderables might intervene. Nor can a department or branch manager be asked to implement a long-term performance budget since there could be changes in the staff and in the persons holding responsibility for such implementation On the contrary, to operate all business expansion programmes purely from short-term angle might result in roadblocks because the inter-relations between the varied sectoral budgets may not be properly coordinated

In preparing Performance Budgeting it is better to adopt two distinct approaches first, the budget may be prepared in respect of each item of banking business like deposit growth, credit and branch expansion etc. and projections may be made in respect of each one of them By aggregating them, the overall budget for the bank as a whole can be got. Secondly, there is the unit approach —the budget for the bank as a whole is the aggregate of the budgets for each region and these, in turn, are the aggregates of the budgets for each branch. As such, the branch budgets constitute the basic unit and these are used to produce the budget for the entire budget viz., master budget. Finally, the budgets prepared separately should be compared for the purpose of checking the correctness of the estimates made

Pre-Requisites

In order that budgets slhpou help the management effectively, they should be built around the following pre-requisites :—

(i) *Pre-planning* . Pre-planning phase of the budget function culminates in a broad operating plan for the year. It is developed from the two basic sources of data (a) environmental factors and (b) company objectives. This plan is issued to the operating departments for the developments of their individual plans and budgets to accomplish the objectives.

The pre-planning phase of budgeting consists of work which must be done in the last half of the year preceding the budget year in order to provide the framework for budget preparation. During this period an analysis is made of previous experience, the state of the economy and objectives set for the banking institution Bankers always concern themselves with economic and industrial trends and as such they take surveys of past performance, polls of business opinions and forecasts made by economists, into consideration while setting the mood for next year's performance budgeting. This budget preplanning activity is akin to the long-range operational and financial planning activities which must take place in an increasing number in every major bank of the country

According to Mr. Sherman Adams of First National City Bank important measures which are essential for performance budgeting preplanning by banks would cover [11] (i) establishing objectives, (ii) determining and defining the problems, (iii) outlining alternative course of action (iv) collecting and evaluating information bearing on all the alternatives and courses of action, (v) deciding among the alternatives and selecting a course or courses of action, (vi) formulating necessary derivative plans and step by step programmes, and (vii) follow-up control over the implementation of these programmes and measurement of the progress achieved from time to time All these steps are basic to successful budgetary planning in banks and, hence, should be taken note of by the budget director and the Chairman of the bank

(ii) *Decentralisation* Decentralised administrative set-up is the other pre-requisite essential for the successful implementation of performance budgeting scheme. As far as the State Bank of India is concerned, it has bifurcated the whole country into nine sectors where Local Boards of Directors have been appointed for smooth functioning of the banking operations. With this change in the management system, it is hoped, the branches in these regions will make greater progress in attaining targets set under budgets.

(iii) *Management Information System :* Since the effectiveness of performance budgeting for solving

the problems and attaining greater efficiency depend on the timely availability of relevant information, it is essential to buildup a comprehensive and integrated information system. The State Bank of India ((SBI) therefore, established a fullfledged MIS Department at its central office, Bombay on Nov. 1, 1975 by converting the MIS Wing which was functioning since early 1974 This MIS would provide data needed by the management in decision-making process. In addition to routine data processing applications, the Bank's Computer is being utilised increasingly as a significant adjunct to the Management in its decision-making function The SBI has also developed computerised functional information systems for deposits, advances, branch information and for reciprocal business as regards to Correspondent banks The Bank has also designed an information system for small scale industrial advances.

(iv) *Training Facilities :* In a service industry like banking, a major input is a trained and contented work force Hence, training of staff at all levels is regarded by the Bank as one of the most significant pre-requisites for the efficient working of performance budgeting For this purpose SBI runs a Staff Training College, at Hyderabad and 28 training centres for junior clerks in the country Training was imparted to 8,217 clerks and 6,239 officers during 1975 at different training centres of the Bank.

In order to meet the organisational requirements and to utilise the training facilities to the best advantage, the whole training strategy of the Bank has been reviewed in depth by an expert committee. The Bank's Training College introduced modern training techniques in all courses for improving managerial skill of the Bank's officers and clerical staff. At the level of officers, techniques of modern management, decision-making and budget-oriented functioning are being stressed. The ideas gained in different programmes would prove useful not only in improving the industrial relations but also in achieving the targets fixed in performance budget. Cordial and harmonious relations are maintained with the staff and periodical bipartite discussions are held with concerned Staff Federations to achieve Bank's objectives and settle issues affecting the service conditions of employees which were 1,06,493 at the end of 1975.

Advent of Performance Budgeting in SBI

The system of performance budgeting was first introduced in the State Bank of India by its ex-chairman Shri R K Talwar, in 1971. Similarly the concept of performance budgeting was adopted in Syndicate Bank in 1973 by its Chairman Mr. K.K. Pai. The activities of performance budgeting in SBI can be divided into three phases:

(i) Preparation of yearly Performance Budget
(ii) Mid-year review, and
(iii) Performance Appraisal.

Preparation of Yearly Performance Budget

The yearly performance budget of SBI reviews the last year's performance, sets targets for the current year and makes tentative projections for the coming year Quantitative as well as qualitative targets in respect of critical areas of Bank's operations such as growth of deposits, expansion of credit, branch expansion and recruitment programme, plans regarding training facilities, earning and expenses etc. are submitted by each divisional manager. These plans are compared with the previous year's performance and then approved budget and the significant deviations for the current year are evaluated and explained. The accounts department consolidates divisional plans and prepares a summary of profit and return on investment as well as targets regarding deposits for the SBI as a whole.

The Chairman of the Bank has one unyielding policy: The Bank and its branches must demonstrate improvement from year to year. An improvement is specifically related to better profits and more efficient performance on all fronts. These yearly budgets are discussed by the budget officers with the Chairman and if the overall consolidated picture is found unsatisfactory, the same are returned to divisional managers for improvement in respect of cost reductions or other improvements to achieve the desired level of profit or increased level of deposits. Thereafter, revised budget plans are submitted which acts as the operating budget for the next year. Thus the main purpose of the annual performance budget is to set targets to be included in the next year's performance budget, the preparation of which begins four to five months in advance.

The annual budget for the Bank is further broken into quarterly/monthly and weekly budgets so that the performance could be measured periodically against these pre-set goals and timely corrective action might follow. The management control system based on such a scheme of annual budgeting is expected to provide proper direction in regard to the Bank's activities and make the operating staff more conscious of what is expected of them in regard to business, costs and profits.

The Mid Year Review

The chief aim of the mid-year review is nothing but midcourse correction of the targets set forth in the annual performance budget. The revision if necessary, is done on the basis of actual experience gained during the last six months and also on statistical data collected so far. Divisionwise income, profits and loss are also depicted. The mid-year review is completed by the end of September, when it is printed and then the revised budget becomes operative for the next six months.

Performance Appraisal

The appraisal system consists of a series of periodical reports which assist the bank management keep constant watch on the progress of the operations against the budgeted targets and remedial action initiated wherever nessessary The performance appraisal system consists of :

(i) a weekly report; (ii) a monthly report; (iii) a quarterly review and audited profit and loss statement and balance sheet; and (iv) the annual reports and accounts.

All these reports aims at:

(a) maximum disclosure consistent with the interests of the bank;

(b) minimum of details consistent with proper explanation of events.

(c) clairty, simplicity and consistencey of presentation to encourage assimilation ; and

(d) attractiveness of layout to engender interest.

(i) Weekly Review Report

Weekly reports are prepared by the Central Accounts Section. It includes a brief note on the progress and further prospects. All the managers of the different departments meet to discuss this report. The performance of the week is compared to the targets. Shortfalls, if any, are talked about and corrective measures suggested. The weekly

meetings play an important role in the performance evaluation system. It is a useful means to keep the Chairman aware of what is happening in the bank.

(ii) **Monthly Review**

The monthly reports are consolidated from the weekly reports by the central Accounts Section and are sent to the Management Service Division which put them together and and disseminates the final report. Monthly reports which reflect the progress of the working (a) position of deposits, (ii) cash flow statement, (c) activities of each branch etc. (d) manpower position, and (e) loans advanced to different sectors, are submitted to the management along with the datum as per the Budget and also with the figures of the corresponding period of the previous year This enables the management to find out well in time whether the progress of deposit mobilisation, credit planning etc is satisfactory and whether the implementation is proceeding according to plan, customer service is being maintained well upto the mark and budgeted targets are being achieved Here, we can hope to improve upon this report in the coming years by adding the monthly profit and loss account also

iii The Quarterly Review

Quarterly accounts including balance sheet and Profit and Loss statements duly audited and certified by the Chief Internal Auditor are being presented to the Board of Directors. The report also contains the following information :—

(a) Audited profit and loss statement of the quarter as compared with the data of the corresponding period during the period year;
(b) Chief Internal Auditor's Reports (in brief), notes forming part of accounts;
(c) Aggregate deposits (demand and time) received division-wise;
(d) Loans advanced to industry, priority sector etc. division-wise,
(e) Investment in Government securities;
(f) Reports on the special activities of divisions,
(g) Cash position during the quarter;
(h) Overseas operations;
(i) branches opened; and
(j) Progress of Merchant Banking Division.

iv The Annual Accounts

The Annual Accounts and reports prepared by the Central Accounts Section do not need to be elaborated upon since the form and structure of the same are well-known The consolidated accounts duly audited are presented to the shareholders in the annual general meeting. Every year, a fresh look is given to the techniques employed in performance budgeting and improvements are made wherever possible and care is also taken to see that the committee meetings do not become monotonous and stereotyped. They are kept lively with discussion on current problems. Annual meetings are held at different local headquarters so as to know intensively about local conditions and attributes. Such meetings have been of great help in decision-making process regarding local projects and problems.

Main Constraints

In Indian banking system, there are a number of constraints with regard to performance budgeting For instance, the branch expansion programme of the banks is not design ed for maximisation of profit but conditioned by the larger national interest, viz, to create the infrastructure essential for the rapid economic growth of the backward regions Every bank has to open branches in the Lead Districts compulsorily even though the branches may not earn profit in the short-period. But in the long run, the development of these districts is bound to spell prosperity not merely on the local community but also on the bank itself

Secondly, the interest rates which bank charges on various categories advances do not enjoy that degree of dynamism as in foreign countries For example, it is necessary to charge lower rates of interest from exporters in order to stimulate nation's exports What is more, the concessional rates of interest charged to agricultural borrowers as well as small-scale industrial loans are designed to help these classes to enhance their investment in these neglected sectors.

Thirdly, the amount of investments which each bank makes in government securities is a fixed percentage of the deposits.

Fourthly, as regards expenditure, the major single item is interest remitted to depositers. It is pertinent to note, that interest paid on different types of deposits are fixed by Reserve Bank of India taking into consideration the need to prom genuine savings.

Fifthly, one of the most imp tant aspect of performance budg ing in banks in developed countr is profit planning. American ba rate profit planning as one of th most valuable tools of manageme Profit planning implies the system tic working out of the policies to followed and the steps to be tak to achieve certain well defined jectives. State Bank of India be a nationalised bank, maximi tion of profit is not its sole a Besides, its profit cannot be ba on exploitation and imbalan growth of the country S B.I a lacks efficient system of account and efficiency-cum-propriety a to minimise overhead expens Thus, there are many constra which banks in India including have to face with regard to the formance budgeting of income, penditure and net profit etc

Suggestions

Banks in India have just co menced thinking about drawing of performance budgeting majority of the banks, the organi tional set up for such an exercise only in the process of being creat Hence, Indian banks will have take guidance from foreign ba regarding the appropriate form organisational machinery a techniques most suitable in draw up performance budgets. In t respect following observations co be of great practical guidance:

(1) The top executive of bank should be the key m in a bank's budgetary pr ramme; without his coo ration, the budgetary pr ramme would not get off feet. Every chief execut has plans for the operat of his business and the bud system is the means by wh he can formalize and publ such plans and observe performance of his line ma gers in carrying them o
(2) The Line Officers sho allocate some time to budg ing, even though their ca bility as doers than plann is more significant to bank.
(3) The Budget Director of Bank must possess a com nation of talent and perso qualities so as to seek support of the top execut on the one hand and suffici cooperation from key l officers, on the other.

(4) The Budget Department should be small enough to justify its continued existence.

(5) It would be folly to expect impressive results immediately. But it is certain that performance budgeting is bound to make a big difference in the long run.

(6) It is true that bank's budget must be made by bankers themselves. But outside consultants could be of great help in providing an objective appraisal of bank's competitive strength and weakness. Their services may be utilised in studying particular problems in such spheres where sufficient expertise is lacking among the bank's staff

(7) The scope of planning, organisation, staffing, information system etc. regarding performance budgeting will have to be carefully thought out in order to avoid mistakes to the minimum.

(8) Conferences of budgetary officers of different major banks may be organised from time to time to discuss the problems and exchange experience for mutual advantage

(9) The exercise of performance budgeting should be simplified. The system should be based on the highest possible level of motivation rather than on 'pressure device tactics' to goad bank employees to greater efforts.

(10) One of the main dangers to be avoided in practical use of performance budgeting is the pitfall of taking budget as something fixed and immutable. The budget is a planned course for the future and that course must be reshaped and reset as necessary to deal with developments that may arise on the journey.

Conclusions

The system of performance budgeting is no longer shun in SBI as unnecessary work or as redtape imposed by the financial hierarchy but they have welcomed it as a real help in management function. But bugeting is still to penetrate into the lower level of the organisation so as to earn rich dividends. SBI has accepted the principles of management by objectives and self-control and thus has paved the path for adoption of new patterns of management to attain desired goals and accelerate productivity. In itself, this is no petty achievement.

Many developing countries are fortunate enough to own good mineral deposits; these must be developed in the first instance. An undeveloped deposit contributes nothing while lying undisturbed. It is economical under today's prices and technology. Tomorow is uncertain. Both the parameters may change rendering a deposit obsolete. It is only in exceptional circumstances a deposit should be allowed to remain dormant to be used at a future date, says

A. M. HUSSAIN

MINERALS AND DEVELOPING ECONOMICS

RESOURCE ECONOMISTS contend that the presence of natural resources is not essential to economic well being and development of a country, but they also realise that the smaller a country's stock of capital and the skill of its labour force, the greater will be the importance of its natural resources, for they provide a ready made stock of capital which can permit the country to leap over the years that would be required to accumulate the same stock of capital out of income.

Most of the developing countries have, indeed, smaller stock of capital and a vast force of unskilled labour. In fact, all the three basic factors of production i e, land, labour and capital are inadequately developed in these countries. The land in most cases is worked by primitive methods, offering a marginal living and contributing little in the way of surplus which might serve as a spring-board for development Labour may be in great surplus but is limited in skill and in the concepts of entrepreneurship. Capital is limited in supply, and is slow in forming due to the inability of the people to accumulate savings, and the lack of any tradition of investment. In the developing economies, it is in the upliftment of these aspects that the role of minerals assume a far greater importance than what is generally realised.

Financial Benefits

Once mineral development has begun, benefits to the producer country take many forms. The most direct and apparent contribution is direct income in the form of profits from government held corporations or taxes and royalties from other operators. The general trend is that most governments try to maximise these benefits through expansion of production and through increasing the tax or royalty rates.

The developing countries need a rapid and sustained increase in export earnings to cover the imports of capital goods and to service their foreign borrowings, and the contribution of mineral raw materials to export earnings of these countries is surprisingly high. Statistics shows that some 45 per cent of the value of imports from all developing countries by developed countries generally consists of metals and fuels Thus mineral exports lessen the 'balance of payment' constraint and increase the rate of growth of the economy.

Besides the above, minerals offer other financial benefits. Most of the sales income of the producers goes back into the economy to pay local wages, to purchase supplies and materials and in some cases, it returns as new funds available for additional local investment.

Infrastructure

Mineral development has to be served by a modern infrastructure—transportation facilities, communication, power etc. Many mineral deposits are remote from settled areas and the development of such deposits involves the construction of a complete infrastructure which may include railroads, roads, airfields, ports, power facilities and townships. This has been done in many parts of the world such as in the development of copper deposits of Congo, Chile and Peru; tin deposits of Bolivia; iron ore deposits in many parts of the world and oil-fields of the Middle-East. There is no doubt that the development of infrastructure has contributed significantly to the economic health of the region but it must be borne in mind that the infrastructure created to serve mineral development is a special infrastructure designed perforce to serve mineral production alone, for in isolated areas other economic activities are generally lacking. The other side of the picture may be that the planners in their anxiety to maximise mineral production may overlook serving other economic developments. Hence thoughtful planning is essential to see how best even that capital which is available only for mineral development in a fixed region can be supplemented so that the infrastructure is so designed that it sub-serves multiple economic activities, if possible.

A Paradox

It is readily apparent that the impact on a region from isolated development is not as great as it would be if a mineral deposit were located in a less isolated areas. It is a paradox that many important mineral producing regions, over a long time, have remained backward. For example managanese has been mined from Balaghat and Bhandara districts, India, for about a century. Similarly, Shingbhum and Keonjhar districts have produced iron ore for a long time. But the standard of living of the Gonds and Santhals of these areas have gone up only marginally

However, there is good deal of scope to introduce careful planning so that regional development is also accelerated. In evaluating such situations much more attention could be paid to the possibilities of increasing the economic linkages through which certain materials and supplies needed by the mining operations are produced locally. This not only

---

Dr Hussain is Mineral Economist, Indian Bureau of Mines, Nagpur.

ssists in creating manufacturing units but also increases the degree of integration of mine into the economy of the region.

Scientific Outlook

Beyond the immediate gains mentioned above, mineral development also provides an environment that will accept and encourage development It is a well known fact that economic development must involve the application of scientific concepts and techniques The population of an area which has developed scientific thinking is expected to be more ready for development than the others The acquirement of scientific outlook, however, is a long process and requires exposure to scientific techniques and thinking over a long time. When mineral development takes place people are indeed exposed to scientific techniques and hence, more adaptable to changes.

If the mineral development planning provides for the training of local people, it is rendering a service of critical and long run importance By creating technicians, the industry is helping in the creation of a receptive attitude towards scientific thinking which will ultimately tear asunder the deep rooted traditional thinking and will form a springboard for economic development To gain quick results trainin should be imparted from supervisory level downwards including electricians, metal workers, mechanics, machine operators, etc

Opportunity Cost

Having assessed the importance of the development of mineral resources, it is fit to examine briefly the financial implications of these developments. Economists have noted that there are certain types of activity in developing countries that lend themselves to local investments as opposed to activities, including mineral development, which are better suited to foreign investment Local investments generally are better used for labour intensive activities that are geared to meeting local needs and have a quick and early pay back, whereas foreign capital can be employed more effectively for activities which are capital intensive, dependent on export markets and characterised by a high degree of technology and risk. Mineral development has a long gestation period, is capital intense and risky and qualifies for foreign capital A number of sources are available which should be judiciously tapped by developing countries A major source of external capital for many purposes is the international agencies of which by far and away the most important is the International Bank for Reconstruction and Development. This agency, however, have made only a few loans for direct mineral development i.e. to Chile and India for coal mines, to Gabon for manganese and to Mauritania to develop iron ore properties. The Bank on the other hand, have done much to help the construction of infrastructure services and processing facilities that draw on mined raw materials. The World Bank also has two affiliated organisations; the International Finance Corporation can make loans to private corporation without government quarantee, and the International Development Association can make loans to less developed member countries on very liberal terms, which may involve no interest payment. The World Bank also assists local Development Banks, created in almost all the countries of the world, with credit or technical advice

The smaller international banks concerned with supporting development are the Inter-American Development Bank and the Export-Import Bank of Washington. These banks have given valuable assistance to mineral based projects in South America and Africa.

The banks generally do not come forward to finance mineral exploration programmes due to their risky nature The United Nations Development Programme (UNDP) has been doing worldwide work in this field by providing foreign exchange financing and lending teams of highly qualified experts to carry through projects assisted by support personnel and local currency costs from the host country National agencies in Germany, England and the United States have provided similar assistance in mineral exploration on a much lesser scale than the UNDP programme.

Local Consumption and Exports

The developing countries are not eminent in the consumption of minerals and metals at present but they have the potentials of enhancing their consumption in future years. The growth in consumption will vary with population and the rate of advance of the economy. India, Indonesia and China comprise the most densely populated areas of the world, and it so happens that these countries also contain the most advanced technological societies of the world outside the Western countries and Japan. China is on the verge of massive industrialisation and so is the case with India and Indonesia. If the billion people who live in India and China increase their per capita consumption of steel and copper to 25 per cent of that of the United States today, it would require an approximated 50% increase in iron ore and copper metal above current world level of production.

In view of the rising trend in consumption especially in those countries which are technologically sufficiently advanced, there will be a growing tendency, and rightly so, to conserve their mineral resources for their own use rather than to export them to other countries. A word of caution, however, needs to be mentioned. Generally speaking there are three consecutive stages in the evolution of most industries that use natural resources The first or primitive stage is one where man exploits a resource by taking what nature offers, with little use of capital or energy other than manpower. The second stage is capital — intensive The third stage is one in which man controls the natural environment and applies the cheapest technology to natural resources in order to obtain a particular consumer good or services Many phases of agriculture are already in stage three where there is mass production at a site chosen by the producer. The technology exists to control other forms of renewable resources such as fish and forests. Because of the physical and geographical characteristic of economic mineral resources, mineral recovery is more firmly fixed in stage two than most other natural resources, but there is little doubt that we are moving towards the stage of control of environment in the case of minerals as well The second stage has been with us for a very long time. When we reach the third stage there will be a shift in the structure of the market from today's backward integration in which consumers of raw materials tend to move back to control their sources of raw materials, to a future situation where consumers will have many alternative sources of supply and alternative materials from which to choose. Producers of raw materials will have to integrate forward in order to assure a market for their materials. The major plank of this thesis is that in future minerals will be recovered from the total processing of low grade rocks that are found in abundance throughout the world.

Books

By Passing the Signpost

;overnmental Systems and Deve-)pment *by V.A. Pai Panandikar*; *'opular Prakashan, Bombay*, 1976; *'ages XIV* + 124, *Rs* 22.

[T IS COMMON knowledge that, there is in operation in contemporary India what the sychologists call "mutual mapping rocess" between research institu- ons and the administrative set- p of the country which are meant) work in close cooperation for evelopmental purposes. However, ot infrequently due to the low 1gree of involvement in each other's fairs, it is only the perceived 1anges of administration rather 1an the intrinsic ones that form the 1bject matter of reorganisational 1ggestions emanating from detached dividuals and their organisations. he present critical study carried 1t under the auspices of the ICSSR 1pear to be an exception. Its pur- ose is to launch a programme of 'ojects during the Fifth Plan period order to suggest proposals of search in the area of governmental stems and development.

As a preliminary effort to identify :y issues for research directed to- ards the solution of policy and 1plementation problems, the 1thor has classified them into nine. hese are· (i) legislative adminis- ation; (ii) judiciary administra- on, (iii) citizen and administra- on; (iv) administration; (v) local 1ministration; (vi) public enterprise; i) agricultural administration; ii) industrial administration; and i) social sience administration. 1e common term used elsewhere z "economic administration" is t mentioned in this list probably cause it is taken as subsummed 1der other headings. This point is t without its interest in so far as e word administration can be upled with practically every field activity engaged in by govern- ental functionaries. Indeed, the 1st administrative structure used for llection, tabulating and analysis data in the country might figure 1der a different heading "adminis- ation of statistics" for which a parate central service is also in 1stence.

The division of various services s been followed up by respective 1apters with introductory notes, 1d an exhaustive bibliography co- ring 77 pages. The thought model hind this research project and its design might merit attention prior to the examination of its main con- tents. The fundamental issue in the study of governmental systems of development has been stated as "the manner in which the Government organises itself for the identification and formulation of development policies and their implementation. Taking stock of the massive amount of literature on the subject the author adopts four criteria for the priority areas. These are: (i) social relevance of the area; (ii) criticality of the area; (iii) likely impact and benefits of the study to the citizens; and (iv) areas of large scale public develop- ment expenditures whose study may add better administration. The areas of priority have been further de- marcated as the following: (i) policy making in development; (ii) bureau- cracy and development; (iii) public sector as an instrument of develop- ment; (iv) citizen participation in development; and (v) rural develop- ment and administration Each one of these broad areas gives rise to several questions and these have been listed. Without the active in- volvement in day-to-day adminis- tration, it must be admitted that the capacity for detached philosophical musings is difficult for most persons to abstract the contours of the Kalei- doscope. However, since most writers on development adminis- tration follow the general syllabi anchored on political liberalism and the current literature on the subject they do not face much difficulty in this task.

The book may be in some respects characterised as a study in the metho- dology of development adminis- tration, a phrase that became hot currency during the last two deve- lopment decades. As a programme of projects for the Fifth Plan period and as a prelude to the formulation of specific projects, the author's classification is unmistakably use- ful and thought provoking. How- ever, the danger implicit in similar programmes is the bypassing of signposts in which the current issues have reached their cross-roads. The unfortunate part of this story is that the viewers of our variegated landscape abroad have succeeded in magnifying the rot in the inters- tices of our organisation while at the same time assigning only subor- dinate roles to us in the large hiera- archy of global development. Far from asserting our achievements, the reactions of most writers have been prominent in the submissive acceptance of these viewpoints.

The documentation listed in the book is not of uniform quality or standard of excellence. Practically, the entire gamut of literature on the subject listed is the product of both well-considered as well as laboured efforts of writers in ad- ministration to speedily study the dimensions of various local or state problems for seminars etc. It is known that integrated thought in regard to all-India matters get vitiat- ed by the patchy terms of references of committees and commissions re- sulting in only ponderous tomes. The swing of the pendulum is bet- ween ideological poles, the practice of mixed economy and romanticism in economic planning caught bet- ween keynesism and *Real Politik*. Quite a large number of the articles in the journals listed and not a few books themselves are pressurised products of ghost-writing but stri- dently authored to capture a place in the galaxy! A good many are pedestrian and lacking in depth. The task of distilling this conven- tional wisdom set before himself by the author is, therefore, at once a metaphysical exercise of a formi- dable magnitude. That this vast scale of feverish activity has been halted during the last one year is a fantastic phenomenon by itself because in every conceivable direc- tion Government became truly and administratively developmental only during the last 1½ years.

Administrative development here is basically an elitist concept in the socio-cultural setting of India and other Asian countries. If we do not overlook the essentially democratic coverage in recruitment policies of all the various sectors of India, what would appear to need atten- tion in terms of development is the grooming of the governmental func- tionaries to minister to the needs of the citizen. This is the meeting point

for both in the fields of the many-sided development process. There can be no One Dimensional Man *qua* administrator belonging to one service Paradoxically enough the authoritarian impress of government and the drawing of sustenance from it deludes the functionaries to view anything but their own self-aggrandizement as a matter of dull routine. It is unlikely that even the interesting psychological studies based on these problems under the U N auspices has assisted in national policy formulation meant for removing the canker of subjective egoism.

A systemic view of the functioning of Government ought hereafter in the light of the 20-Point Programme, to concentrate on horizontal linkages at the socio-economic plane and not so much of the vertical hierarchy and in this respect the author's programme of projects of the areas of priorities, if they are not to lead to a further accumulation of tendentious thought, has to eschew the familiar cliche-ridden development literature seeking to promote elitism and get down to the brass tacks. Otherwise, the dark alleys to which a wrong classification might lead will spell journeys of no return to future generations. Policy research could mean in this context, not merely the study and analysis of the courses of action taken in the past, but the outlining of programmes for future action devoid of the mistakes committed earlier. This, no doubt, requires some negative thinking in the sense of looking beyond the objective reality of the person and also the breaking away from conventional wisdom according to which the way of seeing things in governmental system is also a way of living for good

—B.N. Nair

Tips for Trade

Asean Market for Select Engineering Products; *Indian Institute of Foreign Trade Ashok Bhawan, 93 Nehru Place, New Delhi-110024, Pages 17-194; Rs* 35

THE ASEAN market, consisting of five neighbouring Asian countries, namely Indonesia, Malaysia, the Philippines, Singapore and Thailand, is one of the most flourishing markets in the world, its trade turnover having increased from US £ 13 5 billion in 1970 to US £ 45 5 billion in 1974 With a total trade turnover of £ 174 million with the ASEAN countries in 1974 75, India's participation in the expanding ASEAN trade is but a drop in the ocean. Considering that geographically these countries are our natural markets, ASEAN is but a classic example of our losing gainful trade opportunities to distant competitors like the USA, Japan and the European countries

The IIFT Report, *ASEAN Market for Select Engineering Products*, is in this context an imaginative attempt to break the spell of drift Based on personal interviews with or information sought through questionnaires from 150 manufacturing and exporting units in India and a 4-week overseas investigation in the ASEAN countries by a 3-member research team, it bears the imprint of a painstaking work in a hitherto rather unexplored field

Lest the observations and findings in the Report should degenerate into generalities, the IIFT delimited the scope of the Report to gathering market intelligence in respect of individual ASEAN member-countries in respect of only selected engineering product-groups, namely, (i) autoparts and accessories, (ii) bicycles and parts, (iii) diesel engines, (iv) electric motors, switchgears and controlgears, (v) handtools and small tools, and (vi) textile machinery.

The Report is packed with commercial information about the sales prospects of these product-groups and the ways and means of improving them in the ASEAN markets Analysis of each market in respect of the selected product-groups provides down-to-earth practical information on important factors like market characteristics, domestic production, trade classification, import tariff, distribution channels, retail prices, packaging, delivery schedules, terms of payment, sales promotion etc. The Indian business community would thus find in it practical tips for a growing and diversified trade with the countries constituting ASEAN The manufacturers and dealers in these product-groups will, therefore, do well to take advantage of them.

—Anita

Economic Planning

Indian Economy *by I C. Dhingra and V.K. Garg, Sultan Chand and Sons, New Delhi; Pages* 134; *Price Rs* 4

Indian Economy by *M S Rao; Primer Book Co, New Delhi, Pages* 749; *Price Rs* 15

Micro Economics by *K P Sundharam and E N Sundharam, Sultan Chand and Sons, New Delhi, Pages* 635; *Price Rs* 16 50

IN MODERN times economics has become a popular subject Large numbers of students take up this subject The teachers begin their lessons with definitions of economic terms, which are painfully memorised by the students and subsequently forgotten in the examination hall That is why a good percentage of students are also afraid of this subject Moreover a student who has prepared well and has acquired a lot of information may not get high marks in the examination for his failure to answer each question to the point Writing answers correctly in the examinations has a special technique Fortunately these text books have been written by persons who have to their credit considerable experience of teaching senior students of economics including the students who are appearing for professional competitive examinations All the authors are either paper setters or examiners for a number of universities of this country and as such they have considerable ability to give model answers to the questions and guidance to the students.

Shri Dhingra and Shri Garg have specially discussed the happenings of the last one year and their impact upon Indian economy. In Unit-IV the performance and achievements of the 20-Point economic programme have been added.

Shri Rao has included many new topics of current interest including 20-Point economic programme.

In Micro Economics the authors have tried to meet the requirements of the students' by discussing the Price Theory at great length. The objective type questions to test the students' understanding will prove to be of advantage to them

—N.N. Chatterjee

Development Notes

Udayagiri Tribal Development Project

An outlay of Rs. 39.49 million from the State Plan will be spent on the G Udayagiri Integrated Tribal Development project in the district of Phulbani in Orissa during the current Plan period. This project covers Raikia, Tika ali, G Udayagiri and Chakapadu Tribal Development Blocks.

The main programmes undertaken for this project are Agriculture, Horticulture, Soil Conservation, Cooperation, Animal Husbandry, Forestry, Drinking Water Supply, Communication and Education

Under these programmes, 3580 families will be supplied with agricultural implements, 1484 families with bullocks and 1500 families with goat and pig units respectively About 1000 acres will also be taken up for plantation of Mango, Gauva and Jack fruits etc Priority has also been given to provide drinking water facilities to the Tribal hamlets for which 78 open wells and 51 Tube wells will be sunk The project envisages opening of 275 primary schools and upgrading of some primary schools and for giving better education facility to the tribals.

The most notable achievement of this project is laying of horticultural plantation over 332 acres of land previously under shifting cultivation

Tawa Project Gathers Momentum

Work under the Tawa Project in Madhya Pradesh was speeded up under the 20-point programme As a result, 338 metre long approach canal, which was to be completed by October 77, was completed in June 76

The construction of 26 metre high double D-shaped well, proposed to be completed by October this year, is now to be completed by February. Work on the 3960 metre long tunnel is progressing satisfactorily and excavation work in 3200 metres has been completed so far

Earth work on 3600 metre exit canal is progressing fast. Work has also started on a 60 metre long and 8 metre high pucca anicut and is expected to be completed by the end of the year. Thus, the various construction works under the Tawa right bank canal division, proposed to be completed by 1981-82 are expected to be completed by 1979-80

The Rs 63 47 crore Tawa project on completion, will irrigate 2.47 lakh hectares of land in the Hoshangabad district, thereby raising the area under irrigation in the district from 3% to 60% and bringing in an additional production of 23 lakh tonnes of foodgrains

Safety Device Against Overheating of Diesel Engines

Two engineers of the Punjab Agricultural University have developed a safety device against overheating of diesel engines used by farmers for pumping water. The device is simple and can be manufactured by village artisans at a price of Rs. 20. It stops the engine within 15 seconds of the stoppage of the cooling system

Over 60 per cent of pumping sets installed by farmers on shallow wells are water cooled, water being taken from the delivery pipe of the centrifugal pump to which the engine is fitted. Sometimes if the belt slips or the coupling breaks, or an air leak develops or the water supply pipe gets disconnected, the pump fails to lift water and there is no cooling The engine, however, continues to run although it is not doing any work but is getting heated all the same. This can result in serious damage to the engine Apart from loss of money irrigation of crops is disrupted which again results in poor yields

Farm Fuel Units in M.P.

With a view to providing multi-purpose facilities to the consumers 11 farm fuel centres are now operating in Madhya Pradesh.

These centres have been opened by the oil companies at their suitably located petrol pumps in rural areas Essential commodities like fertilizers, seeds, cloth, drugs, edible oil, torch cells, cycle tyres and tubes, kerosene oil, petrol, diesel, toilet goods etc. are sold at these centres.

The 11 centres now functioning in the State are located Bari (district Raisen), Badnawar (Dhar), Padora (Betul), Bhind, Shivpuri Kalan Anjad (W. Nimar) Babai (Hoshangabad), Piplea (Mandsaur), Satna, Mandi Bamora (Vidsha) and Ganj Basoda (Vidisha).

More such centres are to be set up in the State in the near future.

Indian Scooters for Italy

The public sector Scooters India has concluded an agreement with Lambretta Europe of Italy under which the Italian company will undertake the distribution of the products of the former in Europe.

The agreement is valid for an initial period of five years and the Italian firm has agreed to place orders for a minimum quantity of 5,000 scooters and 1,000 three wheelers in each of the two years 1977 and 1978. The annual cost and freight value of export is about Rs 3.10 crore.

It is hoped India would be able to export scooters soon to the U.S which at present import motor cycles from mainly Japan The U.S. specifications are rather very stringent but it is hoped the Indian expertise would be able to meet them and sell atleast one lakh scooters to the U S. per annum

Underground Water Programme

The Union Ministry of Agriculture and Irrigation has estimated that about 4 million hectares of additional irrigation has been achieved from minor irrigation schemes till now under the National Programme for use of underground water started during the Fifth Plan. The target for 1977-78, is 1 7 million hectares which makes it likely that the Fifth Plan target of 6 million hectares will be exceeded by 1978-79.

The outlay on minor irrigation from Government sources for the year 1977-78 is Rs 185 crore, Rs 35 crore more than the previous year Correspondingly the institutional investment is also likely to increase to Rs 285 crore in 1977-78 as against Rs 235 crore in 1976-77

The Central Ground water Board is also helping the State Governments in the development of groundwater resources by undertaking macro-level exploration and surveys During the current year the CGWB has located three artisan acquifers, one in the Karaikal area of Pondicherry, the second in Ramanath-Puram, Tamil Nadu and the third in the Banganga River basin in Bharatpur, Rajasthan It is expected that initial development of ground water in these areas would be possible without involving any consumption of energy in lifting water

Co-ops Bring Down Prices

Mizoram is probably the only State which has revitalised co-operative societies for the successful implementation of the 20-point economic programme While the wholesale cooperative societies have taken the responsibility of supplying the manufactured goods of mass consumption, the Apex Marketing Society deals with the consumer goods As a result, the prices of essential commodities have fallen by about 25 per cent during the emergency period

The societies have spread their wings to all district and sub-divisional headquarters. In addition there are 115 service societies functioning in remote villages with their own transport to ensure a steady replenishment of their stocks. The co-operatives have lent a helping hand to local farmers by purchasing ginger—the only cash crop grown on a mass scale—worth Rs 1.5 crore on a remunerative price eliminating middlemen

Weaving is a part of the daily life of a Mizo. The State Government has started a crash programme to promote this handicraft through 10 weavers' service centres, with each centre having an equal number of fly-shuttle looms which will be available to the weavers at 50 per cent subsidy.

20-Point Programme in Midnapore

Under the 20 Point Economic Programme 1,44,897.62 acres of land have so far been distributed for agricultural purposes amongst 2,62,849 persons in Midnapore district, of West Bengal Of these 83,720 belong to Scheduled Castes, 57,729 belong to Scheduled Tribes, 22,364 are Muslims and 99,036 others.

Under the programme for distribution of house-sites to landless labourers in rura areas, 1,578.67 acres of land have been distributed amongst 30,286 persons for homestead purposes Persons belonging to Scheduled Castes land Tribes comprise approxima-

tely 52.7 per cent of the beneficiaries A Crash Programme for construction of huts has also been taken up Till now, 1,255 huts have been constructed and it is expected that 3,500 huts would be constructed within the current financial year

Under the West Bengal Acquisition of homestead land for Agricultural Labourers, Artisans and Fishermen Act, 1975, 1,302 squatters occupying 68 405 acres of lands have been identified and benefit of the said Act has been extended to them

Steps have been taken to liquidate rural indebtednets in the district.

World Bank Loan for Agriculture

The World Bank has agreed to approve a five-year project for agricultural development in Orissa costing $ 40 million Through the execution of this multifaced project, the agricultural production in the state is expected to increase rapidly According to World Bank experts a minimum rate of return of 20 per cent can easily be anticipated on this investment of $ 40 million

So far the state government received World Bank loan to the tune of Rs 3 crores only through the Agricultural Refinance and Development Corporation for ground water exploitation although Rs 130 crores has been sanctioned on this head The three-member delegation of the Orissa Government had recently been to Washington to negotiate with the World Bank on the agricultural intensification project

Fruit Trees for Rural Areas

The Department of Rural Development, Ministry of Agriculture and Irrigation has launched a special programme in 451 Community Development Blocks all over the country for planting quick-growing fruit trees on a large scale in the rural areas This programme, forms a part of the Applied Nutrition Programme (ANP) under the department which ensures a regular supply of nutritive foods to rural children, particularly those belonging to the weaker sections

To begin with these trees are being planted in school compounds vacant community lands and other waste lands The Department is also collaborating with the Agriculture Department and it has been agreed that the Social Forestry Project should also supplement the nutritional requirements of the rural people

Arabs Offered Drug Technology

India is prepared to assist the Arab countries both in setting up drug units and transfer of technology, training of technicians and strengthening of research and development efforts It will be glad to offer them expertise and knowhow in the field of production of drugs and medical appliances and help them develop their own capabilities to meet the growing health requirements

Such a step would be in consonance with the objective of exchange of technology among developing countries enunciated by the United Nations Industrial Development Organisation (UNIDO)

Indian drugs worth Rs 450 million were being exported every year to a number of countries including some advanced ones The Arab countries have the right parameters to establish and develop their own drug industry and become self-reliant ultimately They had adequate funds for investment and the level of per capita income being high, there is a ready market for modern drugs

HEL Crankshafts for DLWP

Crankshafts for diesel locomotives are now being manufactured indigenously in the shop floors of the Heavy Engineering Corporation This has resulted in a saving of foreign exchange worth at least Rs 15 million a year Costing $ 10,000 (about Rs 1 lakh) a piece, they were in the past imported from the United States by the Railways Diesel Locomotive Workshops at Varanasi. Since the installation more than a year ago of the French-made fibromatrix RR machine for dieforging, all parts of the crankshafts in the forge shop of HEC's foundry forge plant, the import was confined to crafkshaft blanks

So far, 64 crankshafts made out of imported blanks have been supplied to DLW. HEC has now started manufacturing the blanks and the first batch of crankshafts of total indigenous manufacture are in various stages of production These will be delivered soon to the Varanasi workshop

At present, HEC has got firm orders for 156 crankshafts. Order for another 135 is expected at an early date.

The fibromatrix RR machine specially designed by a French firm to suit the 2,650-tonne press in the forge shop cost HEC nearly Rs 10 million India is probably the fifth country to produce crankshafts through this particular process called the RR process, the others being France, Britain, Japan and the United States

Watch factory in Joint Sector

The Andhra Pradesh Industrial Development Corporation (APIDC) has decided to set up a joint sector watch factory in the State at Shadnagar in backward Mahaboobnagar district at an estimated cost of Rs 50 million The unit will provide employment to nearly 900 persons The project is being planned at the instance of the Union Government in line with their "crash" programme for raising the level of production of wrist watches in the country on a priority basis

World Bank Loan for Agriculture

The Work Bank will provide a loan assistance of 14 2 million dollars (about Rs 128 million) to the West Bengal government for its ambitious "agricultural research and extension project' The total cost of the project was about 28 million dollars (about Rs 250 million)

The project was very basic and vital to reorient the whole agricultural operation composed of three parts research, training and extension It would be implemented in five years Under this project research would be conducted on cereals, sugarcane, oil seeds and water management to provide better information to farmers. A team of 4,000 village level workers would be deployed for extension work so that excellent liaison was maintained all the time with farmers A large number of subject matter specialists would also be appointed under this project

Indian Coal for EEC Countries

Italy, West Germany and Holland have for the first time, placed orders for Indian coal Belgium Denmark and France were the first three countries of the European Economic Community to import Indian coal With these three additions, Indian coal will now go to six EEC countries during the current financial year Italy has ordered two lakh tonnes of coal while West Germany and Holland have indented 25,000 tonnes and 20,000 tonnes respectively The first shipment of coal to Italy has already left Paradip port

Coal exports to the EEC countries are expected to pick up in a big way during 1977-78 Most of the coal is expected to be shipped from Haldia port after the commissioning of the mechanical loading system before the end of the current financial year A four member delegation of Coal India Limited and the MMTC is on a visit to Europe to negotiate contracts for export of about 1 5 million tonnes of coal in 1977-78 and for a similar quantity in 1978-79

Copper Project Approved

The Malanjkhand copper project in Madhya Pradesh has been approved by the government and will now be implemented by Hindustan Copper Ltd , at a cost of Rs 919 million The first large open pit mine in hard rock, the project is expected to produce two million tonnes of ore which will yield 23,000 tonnes of copper This would not only help copper production but also develop the tribal and backward district of Balaghat in Madhya Pradesh The development of the mine envisages a preparatory period of 16 months and ore production of one million tonnes annually (yielding 15,200 tonnes of copper) is to be achieved after four years, while the two-million stage will be reached in six years

A concentrator plant is also to be set up at Malanjkhand to treat two million tonnes of ore, although the first stage will cope with one million tonnes Current demand for copper is about 55,000 tonnes annually and is expected to rise to 60 000 tonnes by 1978-79 To meet this, a number of other projects such as the Rakha mine expansion, the Ghatsila Smelter expansion etc—are being undertaken.

VERDICT OF THE PEOPLE

IN a nation's history a time will always come for heart searching, and the people who remain at the receiving end of the administration process will bide for the moment of judgement. For us that moment came with the historic decision of Shrimati Gandhi to seek people's frank verdict in regard to the highly controversial 20-months old emergency during which citizens' freedoms were severely abridged in the name of development and progress. The people gave the verdict after a momenteous and keenly-fought poll in which more people participated than ever before in India's 30 years of parliamentary democracy. The verdict returned after six weeks' hectic electioneering rendered a stunning blow to all those who had taken political authority for authoritarianism and who naively believed that progress could be achieved through bulldozers. To people in other parts of the world – who were being led by their own media to believe that India's vast, illiterate electorate was a gigantic rubber stamp, the shrewdness and maturity of the Indian voter has come as a great surprise. The average Indian has shown that no politician can take his support for granted. This election to the Parliament has proved to be the most effective, single piece of education to both the elector and the aspiring politician.

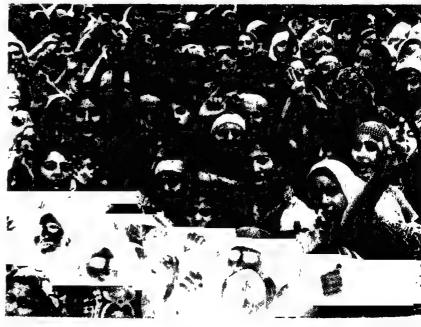
There are a few salient features of the general election which should not be missed by a student of democracy. India has the biggest electorate in the free world, numbering over 320 million adults and spread over thirty one States and Union Territories. Language, religion, caste and economic status exist as artificial but superficial barriers among them. The entire process of election conforms to clearly defined rules made under the Representation of People Act. The Election Commission, an independent, statutorily established authority, directs, controls and supervises the elections in a manner that ensures maximum possible freedom and fairness at every stage of the election process. The credibility of the Election Commission in the eyes of the public is a fundamental prerequisite for the functioning of a democratic society and India can well be proud of having evolved an institution that answers to exacting requirements of fair and free elections. The secrecy of the ballot, the freedom of the candidate to campaign within the established law and the unimpeachable impartiality of the election machinery are the main ingredients of our faith in democracy and the people of India can well be proud that this faith has been vindicated in all the general elections they have gone through. India

Shri Morarji Desai being sworn in as Prime Minister of India by the Acting President Shri B.D. Jatti. An Octogenarian whose health and looks belie his age, Morarji was a stalwart in India's freedom struggle and is one of the great living Gandhians. In what will undoubtedly go down as the most crucial and historic general Election that the country has seen, the Janata Party, consisting of various shades of opposition, put up a united front against the Congress Party led by Smt. Indira Gandhi and won, and Morarji was unanimously electrd to lead the government. With the swearing in of the new Prime Minister and his colleagues the accepted democratic norms which had come under eclipse during the emergency have again come into full play, restoring man's faith in man.

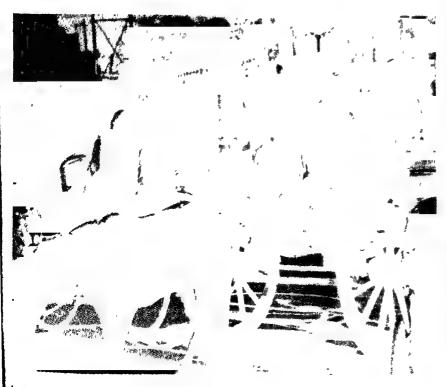
has also proved, through all these six general elections, that the doubting Thomases who placed a heavy premium on formal literacy stand disproved. The Indian voter, whether he can write or not, is a shrewd person who knows what democracy means to him and what it is like to exercise his option without fear or favour. It must be said to the credit of the campaigners and the leaders on both sides that no matter how harsh they were in the criticism of the opponent, they respected the dignity of the individual and directed their broadsides to the principles and policies pursued by the opponent. The political parties and the candidates have, by and large, observed the code of conduct prescribed by the Election Commission.

This does not mean that there have not been minor lapses. From some parts of the country reports did come that the list of the electorate was not complete. Many within the voting age found themselves left out. In a few booths over-enthusiastic workers indulged in malpractices which got themselves promptly reported in the press. In most of these cases, however, corrective action was taken by ordering repoll. But when compared to the vastness of the country and the undertaking, such incidents were like minor ripples and they were hardly able to influence the final outcome.

As these lines go into print, the new government has been sworn in with Shri Morarji R. Desai as India's fourth Prime Minister. This is an

The jubilation of the students in the victory of the Janata Party highlighted its popularity among the citizens of tomorrow. The youth played a crucial role in electioneering with their main slogans built round the concept of the citizens' freedom.


The victorious candidates of the Janata and CFD assembled at Mahatma Gandhi's Samadhi in Rajghat, Delhi, to take the oath of loyalty to democracy in a dramatic gesture of commitment to the principles to which the Father of the Nation had dedicated his whole life. The oath was administered by the saintly leader of the opposition movement, Shri Jaiprakash Narain in the presence of Shri J. B. Kripalani, another great stalwart of the freedom struggle.

With most of the leaders freshly released from prison and with very little time and resources to prepare for the elections, the workers of the Janata Party relied heavily on the justness of their cause and their own capacity to carry the message to the electorate by whatever means at their disposal.


event of historic significance for India and its democratic traditions. For the first time we have a government which has been captured, through the peoples' overwhleming verdict, by the opposition. Much of the aura that enveloped the Indian National Congress as an organisation which secured for India her freedom and brought parliamentary democracy into being has worn away. The people are less sentimental and more pragmatic. They know what is poverty and they will continue to suffer its consequences if inevitable; but they see no inevitability in the loss of basic freedoms which give life and content to democracy and the dignity of the individual. They have also realised that economic development itself, if it has to be purposive cannot divorce itself from the basic human freedoms. Politics cannot be over-simplified into a struggle between bread and freedom. Loss of freedom can mean, and does often mean loss of bread.

So, if there is a single lesson that the people of India have taught the arm-chair politician or the demagogue, it is this: economic development is a social process and as such what the government does through its impressive plan schemes must find implicit sanction in the minds of the people who will be its beneficiaries. Corruption and authoritarianism are the twin evils that erode the dig-

Many urban localities presented a festive appearance with party flags strung into festoons and the enthusiastic young men in trucks and horse-drawn carriages shouting slogans, calling upon the people to reject the old government and vote for the opposition.

nity of man and even bring the development process to disrepute. What the people want, besides end to poverty, is endto chickenery and the innumerable artifices that seek to present the future of an individual or individuals as the future of the country.

The Prime Minister has already indicated that a fresh look will be taken at the Fifth Plan; that infructuous government expenditures will be stopped; that prices of commodities will be brought down and that the problems of poverty and unemployment will get priority of attention. These are indeed major objectives that can put any government to test. The unprecedented enthusiasm that the electorate has shown in bringing a new party into power and the impeccable moral and intellectual character of its leadership should give us hope that tomorrow will be better than today and that India will emerge as a still more united nation involved in an endless process of economic development and social change.

The villages, with their literate, semi-literate and illiterate voters, evinced unprecedented enthusiasm in the elections. A wave of dissent, not unmixed with disgust, swept the countryside practically throughout the north. Punjab, Haryana, Uttar Pradesh, Madhya Pradesh and Bihar voted solidly for the Opposition party, belying the expectations of political pandits. The picture above shows the party agents distributing identity slips to voters.

Below: In a village in Bastar, a tribal area, the voters assembled in a disciplined manner to cast their vote. The women turned up in large number to exercise their franchise

HOW THE PARTIES FARED IN THE POLL

In the recent general elections to the Lok sabha, the Bhartiya Lok Dal secured 43.17 per cent of the total votes polled. The Indian National Congress secured only 34.54 per cent of the votes, the lowest-ever secured by the party It had received 43.68 per cent of the votes in 1971, 40.73 per cent in 1967 and 44.17 per cent in 1962.

The maximum number of votes polled by the BLD was in Haryana where it secured 70.35 per cent folled by 68.15 per cent in Delhi, 68.03 per cent in Uttar Pradesh, 56.13 per cent in Chandigarh, 66.21 per cent in Rajasthan, 65.01 per cent in Bihar 58.37 per cent in Himachal

Close-ups of voters, casting their franchise. Old men, women in burqa, the housewife with the child in her arm the 21 year-old tribal going through his first experience in voting, were some of the familiar slights at the polling booths.

Below: A huge, illuminated board set up before the Shastri Bhavan in Delhi anncunced the poll results as they kept coming throughlout the day and night.

Pradesh, 57.95 per cent in Madhya Pradesh 51.77 per cent in Orissa, 49.54 per cent in Gujarat, 44.44 per cent in Pondicherry, 39.84 per cent in Karnataka, 35.78 per cent in Assam, 32.39 per cent in Maharashtra, 32.33 per cent in Andhra Pradesh, 31.81 per cent in Dadra and Nagar Haveli, 21.46 per cent in West Bengal, 17.83 per cent in Tripura, 17.67 per cent in Tamil Nadu, 14.70 per cent in Goa, Daman & Diu, 12.98 per cent in Punjab, 8.58 per cent in Manipur; 8.49 per cent in Jammu and Kashmir and 7.20 per cent in Kerala.

The Congress party secured the maximum number of votes in Lakshadweep with 58.59 per cent, followed by Andaman & Nicobar Islands 58.54 per cent, Andhra Pradesh 57.36 per cent, Karnataka 56 74 per cent; Arunachal Pradesh 56 34 per cent, Assam 50 56 per cent; Nagaland 48.32 per cent; Maharashtra and Dadra & Nagar Haveli 46.93 per cent each; Gujarat 46.92 per cent; Manipur 45.31 per cent; Goa, Daman & Diu 39.98 per cent; Tripura 39.74 per cent; Himachal Pradesh 38 30 per cent; Orissa 38.18 per cent; Mizoram 37 07 per cent; Meghalaya 35 92 per cent; Punjab 35.87 per cent; Madhya Pradesh 32.50 per cent; Rajasthan 30.56 per cent; Delhi 30.15 per cent; West Bengal 29.39 per cent; Kerala 29.12 per cent; Chandigarh 28 37 per cent; Uttar Pradesh 25.04 per cent; Bihar 22.90 per cent; Tamil Nadu 22.28 per cent; Haryana 17.95 per cent and Jammu and Kashmir 15.20 per cent

Out of a total electorate of 320 million, 60.54 per cent votes were polled this year as against 55.29 per cent in 1971; 61.33 per cent in 1967; 55.42 per cent in 1962; 47.84 per cent in 1957 and 45.67 per cent in 1952.

The BLD had contested 404 seats and captured 294 seats. Besides, 19 candidates fought on the Cong.(O) symbol in Tamil Nadu and Pondicherry and 3 were returned. The Congress had contested 493 seats and it captured 153 seats including two un-contested seats in Sikkim.

The biggest ever democratic election to be held anywhere in the world. India's Fifth General Election was, except for minor lapses, the most orderly peaceful exercise of people's verdict. The ballot boxes were sealed in the presence of the Candidates' agents and with their seals, and preserved in well guarded places before they were opened for counting. The counting itself was done by Government staff in practically a fool-proof manner, to the satisfaction of the candidates themselves.

All record of industrial development pales into insignificance when compared with the rapid industrial growth witnessed during the first two decades of the planned development. There was a time when even ordinary consumer goods like tooth-paste and razor blades had to be imported. India has acquired over the years considerable sophisitcation in industrial products. The pace of development in the industrial field has been rapid and significant. This country is not only at present producing and exporting light engineering goods, but also sophisticated machine-tools, machinery and components like switch-gears, transformers, valves etc. While almost all groups of industries contributed to this increase, the growth has been particularly marked in the newer and more complex industries.

An important feature of industrial growth in the country after Independence has been the rapid expansion of the public sector, says

Dr. Amar Nath Dutta

New Horizons Of Industrial Growth

THE INDIAN ECONOMY has received a new look up Today changes are pronounced not only in respect of the functioning of industrial enterprises all over the country but also in the very pattern of industrial growth which has been continuing for decades together. It is this very process of change and the way in which the economy is making headway that will have a positive impact on the future industrial growth in the country The emergence of a strong and viable public sector has been the precursor of this dynamic process of change.

The Reserve Bank of India in its recent report has observed that 'the nation's economy in the current financial year is expected to reach higher levels of capital accumulation and growth without impairing price stability'. To the extent the report is optimistic, indications are already available that it will be possible to maintain and accelerate the tempo of growth in the changed context which was not possible two years ago when the economy was at 'cross roads'. It is quite significant that the economy has shown definite improvement within a limited span of time.

The positive trends that have emerged by now have to be evaluated in the light of the dismal record of the past three years. Inflation has been controlled. Agricultural production has taken a favourable turn. The overall working of the industrial sectors, in spite of pockets of depression, is showing positive improvement. The capital market has regained the tempo that was sadly missing for some time. And the most important factor is the emergence of the public sector with such positive gains that it envisages a new sectoral-mix in the country's economy.

Dr. Amar Nath Dutta is Research Officer, Indian Chamber of Commerce, Calcutta.

Keeping in view the Fifth Plan needs, a series of measures were adopted to gear up the functioning of the industrial machinery and the special facilities for diversification allowed to machinery, machine tools and electric equipment industry were calculated to impart flexibility to the production process. In pursuance of the economic programme announced by the Prime Minister, the Government reviewed the question of further relaxing and simplifying the licensing policies The two-fold objective was to stimulate investment in the priority sectors and to ensure fuller utilisation of the installed capacities Towards the end of 1975, the Government exempted from the normal industrial licensing proposals medium entrepreneurs to set up new capacities and utilise the existing capacities to a fuller extent in 21 industries. Another 29 medium sector industries were allowed similar facilities with the twin objective of controlling inflation and increasing production in key and important industries 15 selected engineering industries thereafter were allowed to grow automatically at the rate of 5 per cent per annum or upto a ceiling of 25 per cent in a plan period.

These steps have been in the right direction and their success is quite evident from the improved performance of the major industrial sectors in the last year. With industrial output growing by 10 per cent in the first quarter of the current year, the fiscal incentives announced by the Finance Ministry should be regarded an added stimulus for sustained growth. Some of the 43 industrial products which have become eligible for the 25 per cent relief in excise from July 1976 were already among the beneficiaries of the Budget concessions announced earlier Yet, the fiscal gesture could not have been better timed. The maximum marginal rate of direct taxation has been reduced from 77 per cent to 66 per cent. A system of investment rebate at the rate of 25 per cent of the cost of acquisition of new plants and machinery has been introduced. Exemption of tax on the interest received by banks on long term loans to the industry will enhance financing facilities Removal of restrictions on the payment of dividends is another major step to promote investment The substantial step-up in plan outlay in 1976-77 by 31 per cent will provide an additional boost to investment. With the Jha Committee currently reviewing the structure of indirect taxes, concessions such as these may be taken as short term steps because more is in the offing.

In the annual report on industrial growth rate, cautious optimism was expressed With the public sector having taken impressive strides, it was indicated that acceleration in growth would depend upon the private sector adjusting to the buyer's market that had set in through a flexible adjustment of its pricing and investment policies.

In their commanding heights, the public sector enterprises recorded a 17 per cent growth of output during April-January 1975-76 over the corresponding period of the previous year. In the heavy industry, production increased by 35 per cent, while the saleable steel recorded an increase of 18 per cent, coal and power 12 per cent each, respectively. The production trends were kept unabated and in

(*Contd. on Page* 14)

Ten years ago we could claim that the No.1 scourge of public health-MALARIA-had almost completely been eradicated. Between 1958 and 1965 the intensive measures to eradicate malaria with the help of pesticides like DDT and BHC had reduced the incidence of the disease from 75 million to barely a million. This resulted in higher agricultural production and improvement in the economic conditions of the people. This achievement, remarkable by any standard, made us all feel that we had won the age-old war on the mosquito. But we were soon shaken out of this complacency when the little insect started multiplying again with a new in-built resistance to the insecticides. In 1975, there were over 5 million malaria patients in Indi and there are more toda How do we propose to mee this new challenge? Th author of this article,

DR S. PATTANAYAK

The Director of the Nation Malaria Eradication Pro gramme, **discusses the ne strategy adopted by th Government to meet thi challenge.**

PRESENT STATUS OF NMEP IN INDIA

MALARIA WHICH has been number one health problem in India is a disease which is caused by the presence in the red blood corpuscles of human beings a unicellular parasite Plasmodium Two species of these parasites are responsible for more than 95 per cent cases of malaria Of these two species, one species *P falciparum* can be responsible for deaths due to malaria The life cycle of malaria parasite involves carrier human being with malaria parasites in blood, mosquitoes which get infected after biting the carriers and the host the human being who is bitten by the infected mosquito and suffers from bouts of malaria fever. It was estimated during 1935 that 100 million persons suffered from malaria every year and about 1 million deaths occurred due to this disease Before the National Malaria Control Programme was initiated in 1952, the incidence of the disease was estimated to be 75 million cases with about 0 75 million deaths directly due to malaria Large areas like Terai area of U P., Wynad in Kerala and Malnad in Karnataka could not be colonised due to the hyper-endemic conditions prevailing there The output of the coal-mines was poor and projects like building of dams, construction of rail tracts, etc could not be taken up due to the ravages of malaria in these areas

Before the Second World War malaria control was difficult, expensive and economically feasible only under particular circumstances The protection of individuals or groups could be obtained either by the Drug prophylaxis or by the use of mosquito nets or house screen ing. The advent of the residual in secticides in the post Second Worl War period changed the concept c mosquito control and it becam possible for the Malariologists t think in terms of control and late eradication of malaria Spectacula results were achieved in the pilo projects taken up by the State Go vernments for control of malari by spray of residual insecticides lik DDT and BHC The Governmen of India with the help of WHO USAID and the States embarke on National Malaria Control Prog ramme in 1952 World Healt Organisation had also taken cog nizance of the results achieved b use of residual insecticides in othe parts of the world also and durin 1955, Eighth World Health Assemb ly at Mexico, declared its objective from Malaria Control to Eradica tion In India, results of the Malari Control Programme had show spectacular success and in 1958 the programme of Malaria Contro was changed to that of Eradication Intensive measures carried out i the States reduced the incidence from 75 million cases to 0.1 millior cases during 1965. Deaths due tc malaria were completely eliminated Rich dividends worth several millions of rupees were reaped as a result of the eradication measures in terms of developments of agricultural land, irrigation and power

Anti-malaria squads go around village taking blood samples to test the existence of malarial parasites.

projects, industrialisation. etc.

From 1965 onwards the incidence of malaria started increasing The incidence, year-wise is given below at Table 1.

TABLE I

Year	Cases of Malaria
1961	49151
1962	59575
1963	87306
1964	112942
1965	100185
1966	148156
1967	278621
1968	274881
1969	348647
1970	694647
1971	1322398
1972	1428649
1973	1930273
1974	3167658
1975	5166142

The drastic reduction in the malaria cases with no deaths due to malaria brought about a sense of complacency amongst the public, the administrators and the malaria workers. Initially other household pests like, house-flies, bed-bugs and cockroaches were also killed when the spraying was carried out in the villages for control of mosquitoes. Rapidly these pests developed resistance to the insecticides and the collateral benefits which were so obvious, were lost. This resulted in disinterestedness of the people at large who during subsequent years many a time, would not cooperate in getting their houses sprayed So the totality of inssecticidal coverage, as envisaged in the programme, was not achieved

The main characteristic of the Eradication Programme was the total coverage of all malarious areas. It implied that all houses would be sprayed and the work would be carried out at the appropriate time with greatest efficiency, so that before the malaria carrying mosquitoes would become resistant the disease would be eradicated.

The setbacks in the incidence of malaria have been due to lack of achievement of the above requirement. The insecticidal sprays which had to be continued, resulted in the development of resistance and the tools which were once considered to be sharp enough became blunt in many areas.

The increased incidence of malaria has caused great concern to the Government of India and a Modified Plan of Operations has been evolved. This Plan is a three pronged attack on Malaria. The objectives under this Plan are; (1) deaths should not occur due to malaria (2) people may not suffer from malaria and (3) the gains achieved are maintained.

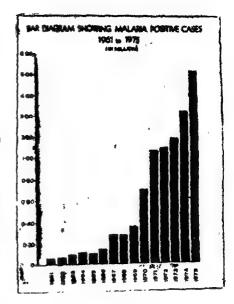
The three pronged attack is:

(a) All out efforts to be made by the Government by carrying out malaria control measures keeping into consideration the degree of the incidence of malaria in different areas.

(b) People's participation, particularly in source reduction and in the distribution of antimalaria drugs in the remote areas

(c) Research, which had remained neglected for such a long time because of the excellent results that were initially achieved under NMEP

(a) Government Efforts :

Adequate quantity of antimalaria drugs and insecticides are being procured These are to be supplied at the periphery at the appropriate time and space Malaria Control Units have been reorganised according to the geographical conformity of districts so as to involve the district authorities in the implementa-


The disease is on the increase but so also are the efforts to eradicate it. Blood samples being tested through a microscope.

tion of the programme. Wherever necessary the antimalaria drugs and insecticides are also being imported The entomological set up has been approved at the zonal levels and these are being established at the revenue divisional headquarters. The entomological component is to monitor, the susceptibility status of the malaria carrying mosquitoes to the insecticides in use and the information is to be fed to the States and to the National Directorate for formulating "Plans of Operations". It is expected that based on the above, under the Modified Plan of Operations right type of insecticides would be used at the correct time in order to achieve maximum and best possible results

(b) People's Participation :

Up till now people's participation was only sought for achieving insecticidal spray coverage Under the new plan of operations the programme is moving in a big way to have the active participation of Panchayats and School teachers in the distribution of antimalaria drugs in the remote areas The National Service Scheme is also taking keen interest and students are participating in carrying out insecticidal sprays and explaining to the villagers the importance of acceptance of spray and need for taking antimalarials in case of fevers

Under a separate scheme the Basic Health Services and the Malaria Surveillance Workers are to be utilised in 70 districts to work as Multipurpose Workers in order to know the feasibility of taking of such work in the other parts of the country.

When Malaria Control Programme was switched over to Malaria Eradication Programme and spray operations were extended to all the rural areas, it was thought, that in urban areas while the local bodies would carry out antilarval operations within the municipal limits, NMEP will take care of the peripheral areas by carrying out spray operations in the periphery to an extent of half mile. The local bodies, could not carry out the antilarval operations because of the paucity of funds. From 1971 onwards, the Government of India, took up 28 selected towns for central assistance for carrying out antilarval operations, under the ambit of NMEP. Under the Modified Plan of Operations during 1977-78, 44 additional towns are also being taken up in the scheme.

(c) Research on Malaria :

As already pointed out the reduction in the incidence of malaria and no deaths made the research worker feel that malaria disease was on the way out and no further research was required to be carried out The institutes which carried out primarily work on malaria were made multidisciplinary. Only the resurgence of the disease has brought to light the lapse of the workers in this field The Government, while approving the Modified Plan of Operations, has desired that intensive research both of fundamental nature as well as short term result oriented be taken up in order to find solutions to various problems which need immediate attention.

The disease is on the increase but so also are the efforts. It is expected that the scrupulous implementation of the Modified Plan of Operations by the States, the adequate supply of the insecticides and antimalarials and their utilisation in time and space in the periphery will bring about decrease in the incidence. It is felt that if the measures as laid down in the Modified Plan of Operations are implemented the disease would be contained and achievements attained would be maintained ☐

INDUSTRIAL GROWTH

Contd. from Page 11

the first quarter of the current year, an 8 per cent rate of industrial growth in such key industries as coal, electricity, steel, fertilisers, cement, nonferrous metals, Vanaspati and jute manufactures showed a remarkable increase There has been a 21 6 per cent increase in power generation during the period In industry, the prospects are for an 11 per cent increase in output in the mining sector and at least 7 per cent increase in manufacturing.

Apart from the performance of the public sector, the trend of production in the private sector, particularly in the critical areas, has been encouraging The total production of machine tools is likely to exceed Rs 100 crore during the current year as against Rs 91 crore in the previous year Production of machinery for manufacture of tyres and rubber goods, which stood at Rs 3 5 crore in 1974-75 is expected to be more than double during the current year Chemical machinery worth Rs 50 crore is expected to have been produced during the year registering almost 20 per cent increase over the last year's production Paper machinery and sugar machinery are expected to register an increase of 56 per cent and 18 per cent respectively, over the last year's performance. Cumulative production in undertakings under the department of industrial development was of the order of Rs. 77 crore which meant an increase of 51 per cent over the corresponding period of the previous year ☐

The investment outlook for 1976-77 has greatly improved. The fiscal incentives allowed to industry, the removal of operational constraints in production, a growth-oriented import policy and the significant breakthrough of the public sector have had their effective compulsions exercised such that the economy is now poised for a cumulative growth The Government has recognised the important role that the private sector will play in the economy and has accordingly clarified its policies in respect of industrial licensing, capital issues, management, foreign collaboration and other related areas The idea is to ensure a fair return on investment On its part, the response of the private sector seems adequate, and with the revitalisation of both the sectors, India's economy has now turned the corner and looks forward to a better future. ☐

A Note From Ronald Ross's Diary

When The Million Killer Was Identified

THE 20 AUGUST 1895--the anniversary of which I always call Mosquito Day—was, I think, a cloudy, dull, hot day. I went to hospital at 7 a.m., examined my patients, and attended to official correspondence; but was much annoyed because my men had failed to bring any more larvae of the dappled-winged mosquitoes, and still more because one of my three remaining Anopheles had died during the night and had swelled up with decay. After a hurried breakfast at the Mess, I returned to dissect the cadaver (Mosquito 36), but found nothing new in it. I then examined a small Stegomyia, which happened to have been fed on Husein Khan on the same day (the 16th)—Mosquito 37—which was also negative, of course. At about 1 p.m. I determined to sacrifice the seventh Anopheles (A. Stephensi) of the batch fed on the 16th, Mosquito 38, although my eyesight was already fatigued. Only one more of the batch remained.

The dissection was excellent, and I went carefully through the tissues, now so familiar to me, searching every micron with the same passion and care as one would search some vast ruined palace for a little hidden treasure. Nothing. No, these new mosquitoes also were going to be a failure: there was something wrong with the theory. But the stomach tissue, still remained to be examined—lying there, empty and flaccid, before me on the glass slide, a great white expanse of cells like a large courtyard of flagstones, each one of which must be scrutinised—half an hour's labour at least. I was tired, and what was the use? I must have examined the stomachs of a thousand mosquitoes by this time. But the Angel of Fate fortunately laid his hand on my head; and I had scarcely commenced the search again when I saw a clear and almost perfectly circular outline before me of about 12 microns in diameter. The outline was much too sharp, the cell too small to be an ordinary stomach-cell of a mosquito. I looked a little further Here was another, and another exactly similar cell.

The afternoon was very hot and overcast; and I remember opening the diaphragm of the sub-stage condenser of the microscope to admit more light and then changing the focus. In each of these cells there was a cluster of small granules, black as jet and exactly like the black pigment granules of the Plasmodium crescents. As with that pigment, the granules numbered about twelve to sixteen in each cell and became blacker and more visible when more light was admitted through the diaphragm. I laughed, and shouted for the Hospital Assistant—he was away having his siesta. "No, no," I said: "Dame Nature, you are a sorceress, but you don't trick me so easily. The malarial pigment cannot get into the walls of the mosquito's stomach, the flagella have no pigment; you are playing another trick upon me!" I counted twelve of the cells, all of the same size and appearance and all containing exactly the same granules. Then I made rough drawings of nine of the cells on page 107 of my notebook, scribbled my notes, sealed my specimen, went home to tea (about 3. p.m.), and slept solidly for an hour. . .

When I awoke with mind-refreshed my first thought was; Eureka! the problem is solved! I seemed to have found in my sleep an explanation of the pigment. The flagellated spores grow in the gastric cells of the Dapple-winged Mosquitoes just as the young plasmodia grow in the human blood-cells, and as they grow they absorb haemoglobin from the blood in the mosquito's stomach just as the Plasmodia absorb it from the bloom-cell (the "pigment" is of course nothing but altered haemoglobin). I was wrong: my cells were in fact the female crescents themselves which had been fertilised by the sperms of the male crescents (which we had called flagellated spores) and were now beginning to grow still containing other original pigment, in the gastric cells of the Anopheles. Scientifically they are called Zygotes. But any explanation was enough at the time, and I wrote that evening to my wife. "I have seen something very suspicious in my mosquitoes today and hope it may lead to something." Then I added: "Lately I have been putting together those rhymes I used to make on 'Exile'—you remember. I think I will write them out fair. . . . " But another consideration struck me. If these cells were the parasites they should grow in size in the last remaining mosquito during the night; and I spent that night in an agony lest my sole surviving friend should perish and go bad before morning.

Next day I went to hospital intensely excited. The last survivor of the batch fed on the 16th, Mosquito 39, was alive. After looking through yesterday's specimen I slew and dissected it with a shaking hand. There were the cells again, twenty-one of them, just as before, only now much larger! Mosquito 38, the seventh of the batch fed on the 16th, was killed on the fourth day afterwords, that is, on the 20th. This one was killed on the 21st, the fifth day after feeding, and the cells had grown during the extra day. The cells were therefore, parasites, and, as they contained the characteristic malarial pigment, were almost certainly the malaria parasites growing in the mosquito's tissues.

The thing was really done.

That evening I wrote to my wife: "I have seen something very promising indeed in my new mosquitoes and I scribbled the following unfinished verses in one of my In Exile notebooks in pencil:

This day designing God,
Hath put into my hand
A wondrous thing. And God
He praised. At His command.
I have found thy secret deeds
Oh million-murdering death.
I know that this little thing
A million men will save—
Oh death where is thy sting?
Thy victory oh grave? □

six killers

The huge discrepancy in the survival rates of infants in developed and in developing countries is a grim pointer to the Third World's need for immunization protection

by David C. Morley

FOUR OUT of five of all the children in the world live in the developing countries, and 97 per cent of all deaths in childhood occur in these countries. In many rural areas, a quarter of the children die before they are five years old, and in some areas this figure may be as high as a third, or at times even a half of all the children born. In the industrialized countries, 975 or even 985 out of every 1,000 children born alive will celebrate a fifth birthday. For this reason, improving nutrition and preventing such infections as measles are a high priority in every developing such infections as measles are a high priority in every developing country's programme while in the development world maintaining a reasonable level of immunity against these illnesses remains a priority for the health services. Six diseases in particular are susceptible to prevention by a simple inoculation procedure.

Measles

Rhazes was born in Persia in the year 860 and was one of the famous physicians of his time. He wrote: "Measles which are of a deep red and violet colour are a bad and fatal kind,". This type of measles was rediscovered less than 20 years ago, and is now considered in many countries to be the infection which causes most deaths. Measles among the malnourished children of developing countries carries a mortality 400 times greater than in industrialized countries.—

Measles is caused by minute particles or viruses which are only visible under the electron microscope. It is highly infectious and can be spread by droplets from the nose or throat of infected children. After 10 to 11 days the child develops a bad cold, may have vomiting and loose bowel motions, and after four days develops a rash overnight. This sudden appearance of the rash has led to many beliefs about the disease Usually the temperature comes down with the appearance of the rash, and for this reason in many countries people try to "bring the rash out" with strange customs such as wrapping the child in a red blanket or even beating him or her with nettles.

Even more misguided beliefs require the food and drink given to the patient to be restricted. The severity of measles in children in developing countries is now known to arise from their poorer state of nutrition. As a result, a much more severe rash develops, which turns the darker colour described by Rhazes; then follows a peeling of the skin as the superficial layers die. Unfortunately this rash is not just on the skin. It also affects the skin inside the mouth-in fact the "skin" that lines the windpipe and smaller tubes of the lung, as well as the lining of the gut—leading to pnueumonia and diarrhoea which are particularly common and severe following measles in developing countries

Not only is the disease more severe but instead of its occurring most commonly in the pre-school and early school years, most children in developing countries catch measles between the ages of five months and three years This early age of infection can be explained partly because the child has so much contact with other children in the joint family system, and is frequently carried about by them, but also because, in the more severe form of the disease found in malnourished children in developing countries the virus particles may be secreted from the nose and throat not just for one to three days but for perhaps as long as one to three weeks Most deaths from measles in developing countries are due to pneumonia or diarrhoea, although some result from the inflammation of the brain which is also still found in industrialized countries. The only answer is vaccination and prevention of the disease

The severe form of the disease occurs in all those countries where there is malnutrition due to a deficiency of protein and calories. It is made even worse where there is also a shortage of vitamin A (the vitamin found in such vegetables as carrots), an acute lack of which can lead to blindness. Both measles and a lack of vitamin A result in the disappearance of the tiny cells

that "oil" the surface of the eye with their mucus secretion. In an attempt to overcome this the production of tears is much increased More than half the blindness in childhood in some countries is due to an attack of measles in a child already deficient in vitamin A.

Diphtheria

It is now more than 50 years since the first vaccination procedures against this disease were started, and few doctors or lay people in the developed countries can remember the illness which has been so effectively eliminated. In the untreated, perhaps 30 to 50 per cent died. The disease first appears as a sore throat, and in the throat a white skin develops over the tonsils and may spread down to the voicebox; in a certain proportion of cases this requires an emergency opening into the windpipe to allow the child to breath

The bacteria which form this skin also produce a toxin which can affect the heart or the brain Unlike measles and whooping cough, diphtheria is not found all over the developing countries of the world, and is more serious in those countries in which small towns and urban life have developed Apparently young children who run about and acquire many cuts and sores on their legs develop an immunity from these sores through being infected with the diphtheria germs early in life. Fortunately the majority gain this immunity without suffering any of the complications seen when the bacteria multiply as a skin in the throat

Whooping Cough

Whooping cough comes second to measles as a cause of morbidity and mortality among infectous diseases in developing countries The duration of this illness is well exemplified by the name "the Hundred Day Cough", given to it by the Chinese. The cough may go on for at least three months, and may recur with any cold or bronchitis over the next year.

Perhaps it is not surprising that so many popular remedies have been suggested Fifty years ago the children were taken through railway tunnels in an open carriage, or more recently they were sent up in an aeroplane. in many countries the patient may be passed under the belly of a donkey The cough, once heard will always be recognized again. and the way the spasm of the cough takes the child by surprise, so that to restore air to his lungs—he sucks air through the windpipe, giving the characteristic whoop The mothers in West Africa had a good description of the cough They would say that the child "took a long time over coughing" They were also familiar with the sticky phlegm that is coughed up, and would pick this out of their small children's mouths It is particularly in these small children that the disease is so severe and more than a third of all deaths take place in children who develop it under the age of five months The child may die from penumonia, or from small or large bleeding in the brain

Unfortunately, in small children in whom the disease is so severe, there is no characteristic whoop, and very often the disease is not recognised for what it is So we use the whoop in the older child to lead us to those families in which there is a young baby who will urgently need treatment, since whooping cough can be cured if it is treated in the first week

Tuberculosis

The wasted adult with poor skin, fever and tiredness, frequently coughing up blood—this was the picture of consumption or adult tuberculosis known only too well 50 or more years ago in Europe. For most people the disease is now no more than a name, and when it is detected there is excellent treatment available Consumption in developing countries, particularly in the cities, is almost in an epidemic state. Nearly one per cent of all adults may be coughing up the germs of the disease. The cough and the sputum spread the disease to the family and others who come in contact, and particularly for children this may be very dangerous.

SAVING YOUNG LIVES

Malaria and viral infections are wholesale killers of children in the developing world. But six diseases preventable by vaccination are killers too - hence WHO's Expanded Programme on Immunization.

W. CHARLES COCKBURN

THANKS TO VACCINATION smallpox is about to disappear as a human disease. Poliomyelitis, diphtheria, tetanus and pertussis are under control in most of Europe, in North America and Oceania and in some individual countries in other parts of the world-BCG vaccine against tuberculosis is highly effective and more recently live measles vaccine has been brought into use on a large scale with outstanding success

Thus seven of the severe specific infections of childhood which have a world-wide distribution have succumbed to the vaccinator - but only in the developed world. In the other half of the world these diseases are as rife and as deadly now as they were earlier in the countries where they are now controlled.

The objective of WHO's Expanded Programme on Immunization (EPI) is to actively encourage and assist countries in the developing world to increase as rapidly as practicable the proportion of susceptible children who can obtain the benefits of immunization as a regular service of health care at the community and family level.

How A Vaccine Works

A person is said to be 'immune' to an infectious disease when the germ which causes it is prevented from multiplying in the person's body In nature, this immunity comes about as a result of an attack of the disease or a symptomless infection with the germ. The immunity so obtained is often life long—for example as in measles

The function of a vaccine is to

In childhood the disease may develop in many different forms The bones may be affected, and in the spine this leads to the characteristic hunchback, as parts of the bones are destroyed by the germs of tuberculosis Particularly frightening is the variety that develops round the brain causing meningitis This is commonly fatal, and even when successfully treated may leave the child with permanent damage to the brain Fortunately, in older children the experience of infection may leave them with a lifelong resistance to a further infection from someone coughing up the germs Whereas 50 years ago the majority of children could be shown by a skin test to have had an experience of the disease, in industrial countries now very few children have the mild infection or the more severe forms This is not true in developing countries, where both the children and the adults suffer a great deal of illness from this disease, which can be successfully treated, or even better prevented, by giving BCG (Bacille Calmette Guerin) immunization.

Poliomyelitis, or Infantile Paralysis

This ancient disease is depicted in sculptures on Egyptian tombs, and one can still find adults in developing countries using a stick in the same way as shown in this carving The small virus of poliomyelitis is spread through food and drink, and in 99 per cent of people it causes either no illness at all, or a nonspecific illness with fever for a few days and aches and pains particularly in the head and abdomen Only about one per cent of all those infected go on to develop pain in the legs and a varying degree of paralysis. But unfortunately, in many developing countries, these vague complaints by a child, and the fever, lead to the parents demanding treatment and perhaps an injection These injections very commonly lead to a paralysis in the leg or arm in which the injection was made

No treatment can stop this paralysis and to minimize its effects the child may have to have years of physiotheraphy and very probably wear metal calipers. Thanks to a very safe vaccine that can be taken by mouth, this disease has practically disappeared from industrial countries But so far very little has been done to tackle it outside the capital cities of developing countries, and beggars with thin useless legs are still comonly seen, as well as evidence of a large number of children suffering paralysis, the majority of whom are unlikely to survive to adult life

Tetanus, or Lockjaw

This is still a problem in developed countries, particularly following serious car accidents or any other injury that occurs out of doors. The germ responsible cannot grow in normal tissues, and grows best when it is in a stick or nail or some other small object that has been left in the flesh following an injury When the germ grows in this way, it produces a toxin which affects the brain and leads to painful spasms with the characteristic locking of the jaw.

A very special and particularly fatal variety is that which is found in small babies whose umbilical cord has not been cut under sterile conditions These babies develop a very severe form of the disease, from which usually at least three-quarters of them die. This disease is one of the most common causes of death in the first months of life Fortunately it can be prevented by careful cutting of the cord, and by ensuring that germs which are common in the soil do not get on to the cut umbilical cord Alternatively, the mother can receive immunization during pregnancy, which she passes through her blood to the unborn baby inside her and which protects it in the first days of life.☐

stimulate an immunity similar to the natural immunity but without the person concerned having to suffer the diseases or suffer more than a minimum of discomfort or reaction.

Vaccines are one of the safest "treatments" available in modern medicine, and though as with all medical procedures there is some risk, those associated with vaccination are extremely rare. The greater the care taken to control the quality of vaccines, the nearer the risk approaches insignificance.

How to deliver vaccination to the "client..

A most important feature of a vaccination is that once a country begins to develop a programme it must continue it beyond the foreseeable future. It is worse than useless to get enough vaccine for the susceptible children in one year and then find there is none for the upcoming age group the next year. Vaccination must be a regular feature of child care, and to have the most effective preventive action in the community a very high proportion (at least 75 per cent to 85 per cent) of the susceptible children must be vaccinated.

Thus a vaccination programme can only succeed in the long term when it forms an integral part of the health services of the country. It ought, in practice, to be a major element in primary health care.

The age of vaccination

For the diseases mentioned above, a child gives its best response to the respective vaccines when about a year of age. But there are variations. At birth a good response occurs to BCG and a reasonably satisfactory response is obtained with whooping cough vaccine and tetanus toxoids. With poliomyelitis vaccine there is a response though it is distinctly less than the best.

Diphtheria toxoid is best given after six months of age. A significant proportion of children below 7-8 months of age in the tropics and below 9-10 months of age in temperate climates do not respond to the measles vaccine. There are two main reasons for these variations. One is that the child has not yet developed its fullest capacity to respond to the stimulus of the vaccine, and the other is that babies are protected for varying periods after birth by antibodies transferred from the mother's blood-serum via the placenta. This "passive immunity" is least for tuberculosis and whooping cough and greatest – and longest lasting – for measles.

How many vaccines can be given at one visit?

From what is said above, it would seem at first sight that each vaccine should be given separately at a different age, and in the best of all possible worlds this might well be the case. But it would mean a minimum of 14 visits to the vaccination point. This is difficult enough in the countries with highly developed services of preventive medicine; in the rest of the world it is impossible

But satisfactory compromises are happily possible, and good if not always entirely optimal responses can be obtained by a judicious combination of vaccines and adjustment of the ages of vaccination; by so doing the number of visits can be reduced to two or at most three. Diphtheria, whooping cough (pertussis) and tetanus vaccines are mixed and given in the same syringe, and the others can be given at the same time as the DPT.

A basic schedule of the kind (which can be changed as local circumstances allow) is as follows:

Age	Vaccines
3 months	BCG (for tuberculosis) first DPT first Poliomyelitis
7 months	second DPT second poliomyelitis measles
9-12 months (if possible – but not mandatory)	third DPT third poliomyelitis measles (if not given earlier)

Using such a schedule a child can be protected for life from six diseases at a cost which will vary from US £ 1.5 to US £ 3.0.

Given then that vaccines are very efficacious and relatively easy to administer, why is it that not more than ten per cent of the children born annually in the developing world are vaccinated? There are three main reasons – the technical problems, the non-awareness of leaders and people, and the lack of effective organisation of resources

The technical problems

There are two main technical problems – the sensitivity of vaccines to heat, and, allied to this, the difficulty of providing cold cabinets running at suitably low temperatures to hold the vaccines from the central storage point to the furthest point at which they are to be administered

Diphtheria and tetanus vaccines are relatively insensitive to heat but the remainder are less stable. In order of sensitivity the succession is BCG and whooping cough vaccine poliomyelitis vaccine and finally measles, which is so sensitive that the very greatest care has to be taken to keep it frozen in the main stores and at 4°C elsewhere. Any departure from this requirement is very liable to result in an entirely useless injection.

Development of simple reliable "old boxes" is a major element of the WHO Programme and the approaches are both to develop short-term solutions and then to find more permanent systems.

At the same time the Programme is investigating methods of increasing heat stability in the vaccines themselves. It is good to be able to report that the approaches to improving both the cold chain and the stability of vaccines are already sufficiently encouraging to promise satisfactory results in a reasonably short period of years.

Non-awareness of the seriousness of the problems

The communicable diseases and mal-nutrition are by far the greatest public health problems in the developing world. Malaria alone kills two or three millions of children below 1-2 years of age. Diarrhoeal and acute respiratory virus diseases are among the prime causes of death in the young. In these circumstances it is not surprising that the diseases preventable by vaccination have been given their proper consideration in the past.

But they too are great killers – particularly tuberculosis, measles in some areas of the world (e.g. West Africa), and whooping cough. Though it does not often occur in large epidemics, poliomyelitis is as prevalent in Africa now as it was in the USA before immunization.

The important point to be noted is that vaccination gives much more rapid and much better return for money spent than any other preventive measures.

Everyone knows that there are insufficient health personnel in developing countries, and that the only means of ultimately assuring a regular programme covering a high

(Contd. on Page 31)

By the end of this year, India will have direct satellite links with 36 countries in the Indian ocean area, served by the Intelsat IV satellite, hovering above the Equator. Two earth stations, one in Arvi and the other in Dehra Dun will work with them for transmitting India's overseas telecommunication links.

The Growth Pattern of Intelsat

MOHAN SUNDARA RAJAN

THE space segment viz the satellite and its organisation have shot into prominence, as they play a crucial role in maintaining the links In this context, the growth of Intelsat (International Telecommunications Satellite Organisation) and its developmental trends and the new challenges facing it in the years ahead, acquire significance.

In 1964, in accordance with a UN resolution, governments and telecommunications entities, representing 85 per cent of the world's telecommunications traffic, met in Washington to participate in a conference It adopted an agreement to establish a global commercial satellite system Starting with eleven members in 1964, Intelsat today has 95 members, in all continents Ten other countries who are not members also use its systems. It may be pointed out that the Soviet Union and socialist countries are not members of Intelsat. Membership is, however, open to any State which is a member of the International Telecommunication Union (ITU).

The world's first commercial telecommunication satellite, 'Early Bird', was launched in 1965 It provided first permanent TV link between North America and Europe Starting with 150 telephone circuits in 1965, the capacity handled by a satellite (Intelsat IV) went up to 4,000 (or 12 TV circuits) by 1971 and today Intelsat IV A satellites can provide 6000 two-way telephone or 20 colour television circuits. Intelsat V, the next generation satellite, will have 12,000 two-way circuits, plus two colour TV circuits The first such satellite is expected in 1979

Obviously, the cost of the single telephone circuit has been plummetting downwards, yielding the economies of scale. To quote the Director-General of Intelsat, Mr.

Shri Rajan is a Science Writer

Mr Santiago Astrain, Director-General INTELSAT

Santiago Astrain, "in spite of inflation, charges by Intelsat for the use of the space segment for telephony have decreased to less than one-fourth of the initial charge set in 1965 and the system has achieved a reliability greater than 99.9 per cent

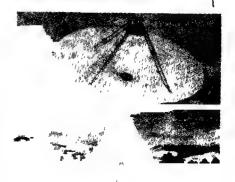
Television, says Dr. Astrain has added a new dimension to its services. The TV coverage through the satellite has jumped from 80 hours in the first year of operation to 13,000 hours last year, when the largest audience ever assembled in the world – some 1000 million people – was enabled to witness the Olympic games in Montreal. Indeed, TV transmission nets only three per cent of Intelsat's revenue. Yet its cultural impact is great. But of a revenue of £ 147 million expected this year, TV transmission will come up to just £ 5 million.

Once the satellite technology was ready to provide acess to more than one earth station at the same time, several earth stations came up in different countries. Starting with 5 stations in 1965, the number went up to 50 in 1971 and to 126 by the end of last year in more than 83 countries in the world. An interesting feature emerging now is that further additions to the earth stations have to come mostly from areas, where the volume of traffic has to be relatively small

In keeping with this new situation, Intelsat has evolved what is known as the second standard earth stations, which have a 11-metre antenna as against 29 metre antenna of the standard earth station, such as the one in Dehra Dun

A new trend which is welcome is the decision to lease its space segment for use for domestic communication links by countries. This has helped several developing countries Already, Algeria, Brazil, France Malaysia, Nigeria, Saudi Arabia, Norway and Spain make use of the facility India, Chile, Colombia and

The Antenna with the Control Room. The main dish is made of a number of panels, adjusted to get very high surface accuracy.

In the background is the microwave tower which sends the signals to Mussoorie for onward transmission to Delhi.


INTELSAT-IV A satellite, the latest in the series.

Philippines will soon have the facility Arrangements are in different stages for installing similar facilities in Australia, Libya, Oman Peru, Thailand and Zaire

India will use the Intelsat IV over the Indian ocean for linking remote areas like the Andamans and Lakshdweep with the main land by reliable telecommunications Seven earth stations will be set up for this purpose in different parts of the country. This will be the first time that the international satellite will be used for operating domestic links.

Intelsat's services have been utilised for providing modern communication facilities to remote areas. Norway, for example, is using the satellite to aid oil exploration in the North Sea. Algeria is using it to establish a direct link across the Sahara to reach its communities 'liv- 'living on the other side'. In fact, the services of Intelsat are being made available both for the international and domestic purposes, on a non-discriminatory basis Provision of domestic service should not, however, impair its prime objective viz. international public telecommunications services of high quality and reliability.

The structure of Intelsat consists of an Assembly of Parties, a meeting of Signatories, a Board of Governors and an Executive Organ responsible to the Board of Governors. The Assembly consists of parties to the Agreement and considers the resolutions and views addressed to it by the other two bodies. It is empowered to formulate policies and long-term objectives. Each party has only one vote. Decisions on substantive matters are taken by an affirmative vote cast by at least two-thirds of the parties, whose representatives are present and voting.

Its ownership, according to Mr. Astrain, belongs to those who use it. It is adjusted every year, so as to achieve a parallel between "what you own and what you use." The share of the USA has come down from 54 per cent to 24 per cent, not because USA's usage has gone down but because the usage by other countries has gone up. Mr. Astrain said the organisation is truly and fully international, what with representatives belonging to 28 nationalities, including India.

The New Challenges

Intelsat, now in the early part of its second decade of service, is pois ed to face several new challenges.

The synchronous orbit, at abou 36,000 km from the Equator, is a limited natural resource. Over 3(satellites, excluding those not an nounced, are already in this orbit 45 more will join them by 1980 according to plans made know uptil now. Since the location of lan masses is not evenly distributed certain areas in the synchronou orbit are preferred. Over the India ocean, the portion between 60° an 100° east longitude and over th Atlantic between 230° and 270' east are preferred.

With the increase in the numbe of domestic satellites, the need ha arisen for coordination with th international satellites in the sam orbit. Interference of radio beam of different satellites has to be sorted out by mutual discussions. Recently, India and Intelsat arrived a a satisfactory agreement for locating India's domestic satellite in a area where Intelsat satellite is functioning. Similar accords would b necessary in the future for satelliti

Testing the reception of TV signals sent from other continents and relayed by the satellite.

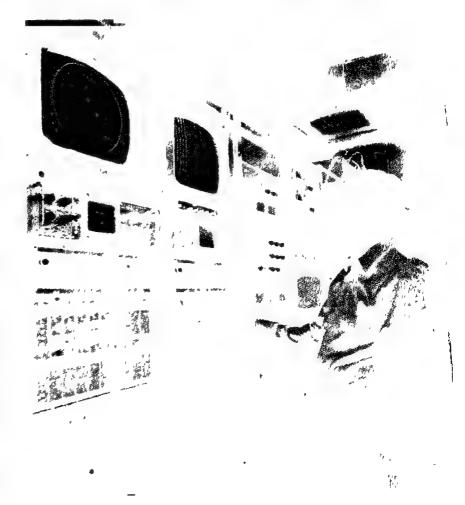
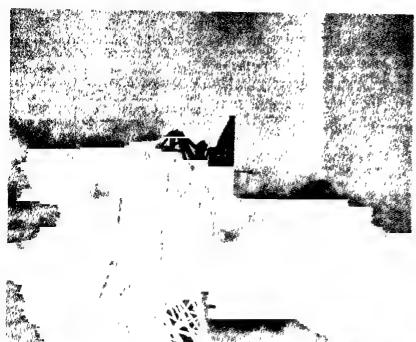
Equipment made by the Indian Telephone Industries Ltd., Bangalore to process the signals. The is the first time that such a sophisticated equipment is made in India.




A view of the Control Panel

of other countries. Intelsat can give a lead in evolving a basis of coordination in a fair and equitable manner.

Intelsat is involved in exploiting the bandwidth, again a limited resource for telecommunication. The next generation of satellities, Intelsat V, will use higher frequencies viz. 14 and 11 Giga Hertz for the first time. Already, techniques called "spot beams", re-use the existing frequencies and augment the capacity.

New techniques like satellite to satellite direct communication will be explored so that better and more services can be provided on a cost-effective manner. Since it is a commercial venture, only proven technologies are used, like the batteries and solar cells, fuel for orbit corrections etc. There are trade-off points in exploiting these techniques. The present life-term is about seven years, based on the well-tested techniques But new techniques are on the anvil. In particular, the emergence of the re-usable shuttle may reduce launch costs and repair in orbit may become possible. Presently, it costs $ 40 million for a single launch. And the total cost of seven satellites (INTELSAT V) (the space segment alone) is about $ 238 million.

Intelsat has acted as a catalyst in triggering off an awareness of space communications for domestic and international needs. It has in a way contributed to the emergence of domestic and regional satellite systems. The lead given by it in coordination of its operations, while considering the needs of individual countries, is worthy of emulation, especially at a time when the orbit is occupied on a "first-come, first-served basis". □

DEHRA DUN EARTH STATION

AN EARTH STATION has a dish-like antenna and related equipment to process the signals to and fro a satellite. It can be used to relay the overseas communications of a country like telephone, telex, telegram and radio-photo.

The second earth station in India is situated near Dehra Dun. The first one is at Arvi near Pune Both the stations work with the Indian ocean satellite, INTELSAT-IV which is 36,000 km above the Equator. The stations are used for relaying overseas communications.

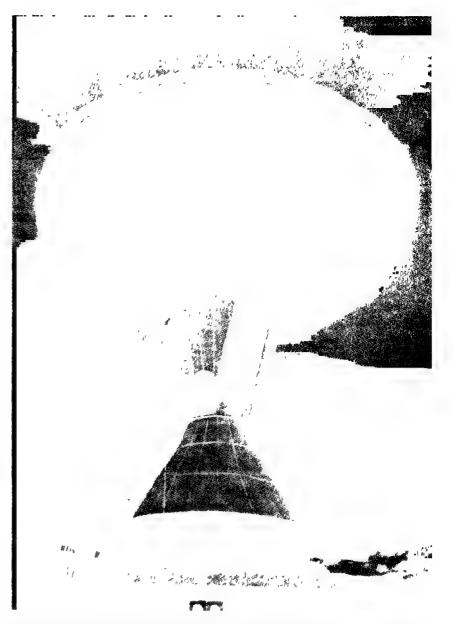
The second earth station has been built to provide a better grade of service to customers in different parts of the country, avoiding long internal haulage of international traffic.

The second earth station is situated in a 30-hectare plot in the Lachiwala forest, some 23 km from Dehra Dun on the main road to Rishikesh.

It is linked to New Delhi by a microwave system which has repeater stations at Mussoorie, Roorkee, Muzaffarnagar, Meerut and New Delhi Ridge. Except at Mussoorie, the height of the relay towers is 100 meters. The towers have been made by Triveni Structurals They have three meter antennae on the top, each facing its counter-part in the other station

The link provides two way circuits, each capable of carrying 960 telephone channels at the same time or colour TV programme. There is also a hot standby In addition, one way television channels have been provided for carrying TV programmes from Delhi to Mussoori

In Delhi, the newly completed Videsh Sanchar Bhavan is linked with Delhi Doordarshan by means of an underground video coaxial cable with provisions for handling international TV programmes The V.S.B. will house the International Telecommunications Centre, International Telephone and Telex Exchange, Programme Transmission Studios and a TV Centre. The total cost of the building is about Rs. 20 million.

In order to receive a signal from the satellite, the earth station


The Antenna, which has a diameter of 29 meters, at Dehra Dun Earth Station. Mad by Electronics Corporation of Indian Ltd., the 300- tonne antenna system ca accurately keep looking at the satellite in space

has a large parabolic antenna about 29 meters in diameter. Made by Electronics Corporation of India Ltd, the 300-tonne antenna system can accurately keep looking at the satellite in space, 36,000 km away

The antenna is fully steerable It can move plus or minus 270° in the horizontal mode and minus two to plus 90° in the vertical mode The antenna amplifies the signals by over a million times

The station has a sophisticated tracking system Its pointing accuracy is 100th of a degree. The antenna movement is controlled either by signals received from the satellite or by manual controls There is an arrangement to automatically correct the errors.

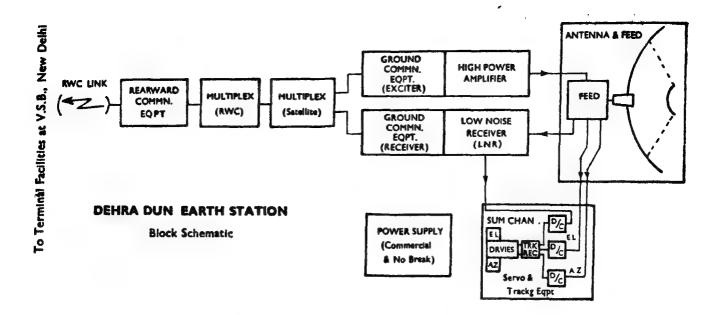
In order to separate the signal from the unwanted noise, the station has low noise receivin equipment which is kept in a tempe rature of minus 255° C.

For transmitting the signals the Indian Telephone Industrie has made multiplex equipmen which acts as the interface betwee the terminal and the satellite. Thi equipment processes the signal containing the information in bot sending and receiving directions.

The processed signals are reampli fied and transmitted to the satellit by 3 KW amplifiers.

To achieve very high reliabi lity of over 99.9 per cent, the sta tion has all the essential equipmen duplicated They include main powe supply In fact, the first station a Arvi has maintained over the las six years a reliability of 99 9 pe cent.

DEHRA DUN EARTH STATION

Block Schematic


The Dehra Dun Earth Station which compares favourably with the best stations in the world has been system engineered, fabricated, commissionned and run by Indian engineers.

It costs about Rs 100 million with a foreign exchange component of Rs.26 million. It has an indigenous content of more than 60 per cent as against 30 per cent in the Arvi project Only special items not locally available were imported

Canada has extended financial assistance to meet these imports by way of a loan and grant

The station meets the stringent technical requirements of the Intelsat system and provides direct satellite links with UK and France on the West and Japan on the East

Plans have been made for augmenting the station capacity to provide additional satellite links with more countries To begin with, Dehra Dun station will be linked to France, UK and Japan □

INDIA'S OVERSEAS COMMUNICATION SERVICE

ABOUT a century after the London-Bombay sub-marine telegraph service began, India's overseas communications were relayed through satellite. The first earth station of the OCS at Arvi near Pune went into commercial operation in February 1971.

OCS now operates 143 channels through the INTELSAT (International Telecommunications Satellite Organisation) system, with direct access to 23 destinations for international telephone, telex, telegraph, radio-photo and other services.

Initially, manual telex and telephone exchanges were installed in Bombay to handle the traffic. In 1972, the semi-automatic telex exchange began operation, providing on-demand telex service. By the end of 1973, semi-automatic telephone exchange was cut over to enable direct operator dialling service.

Though the original equipment was designed to handle traffic with the assistance of operators, the ingenuity of Indian engineers was instrumental in providing international direct dialling facilities from Bombay to London from October 10, 1976 and from New Delhi to London this year.

The capacity of the international telephone exchange is being augmented to 180 international circuits and the process is expected to be completed towards the end of this year. It would then be possible to extend the facility of direct dialling to more countries.

In order to handle the growing telex traffic, a Stored Programme Controlled Electronic Telex Exchange is being installed and will be ready this year. This exchange will have 450 national and as many international trunk lines initially. It will provide subscriber dialling telex facilities to most of the countries in the world.

The telephone and telex operation from New Delhi centre will initially be on a manual basis. A semi-automatic telephone exchange will be set up later.

Today, OCS, operates *telephone* services to 181 countries and 95 per cent of the total traffic are covered by satellite service.

	Destinations	Channels
Direct Telephone Services	33	130
Direct telephone via satellite	23	119

International Direct Dialling (IDD) is available between Bombay and London (bothways) and from New Delhi to London.

Direct Telex Services	22	191
Direct Telex via satellite	17	181

'On Demand' *Telex* service is available to U.K., Hong Kong, Germany and Japan and other countries served by these destinations. In all 173 countries are linked by telex.

Fully automatic dialling of telex calls would be available to most of the countries this year (1977).

Direct Telegraph Services	35	44
Direct Telegraph via satellite	14	19

Besides, there are leased channels for various press agencies, firms, weather services and provision for radio-photo transmission.

The traffic growth of OCS shows an upward trend after the satellite service was introduced.

(Paid minutes in millions)

	Telephone	Telex
1971	.5	1.5
1972	1.8	2.2
1973	2.8	2.8
1974	3.8	4.1
1975	4.7	4.7
1976	5.3	4.8

Radiophoto

High quality radiophoto service is available to practically all countries in the world which are equipped for the service.

Television

The global satellite communication system has made live relay o international T.V. broadcast prog rammes possible. While the facilit is presently available at Bombay the opening of the second satellit earth station at Dehra Dun wil bring this facility to TV viewers i the Northern region also. Th inaugural ceremony and our Prim Minister's address during the re cent non-aligned summit conference in Colombo, were relayed b satellite T.V. via O.C.S. and broadcast live to viewers in Bombay, by Doordarshan.

Data

OCS at present, provides poin to point highspeed (4,800 bits per second) data transmission from Bombay to Hong Kong after successful tests on 9600 bits per second signals. More such high speed data transmission circuits will be provided to airlines and other interested customers. OCS capability in this area was availed of during a recent demonstration of on-line RECON system (2400 bits per second) between Bombay and Rome, organised by the Department of Science and Technology.

Leased Services

Leased telegraph channel facility is very popular with bulk telecommunication users like Airlines, Banks, Embassies, Meteorological Department, Civil Aviation Department, International Trading Houses etc. for whom, round the clock reliable communications are essential. Considering the cost economics to bulk users and the facility of instant communication, more and more such customers are availing themselves of this unique facility.

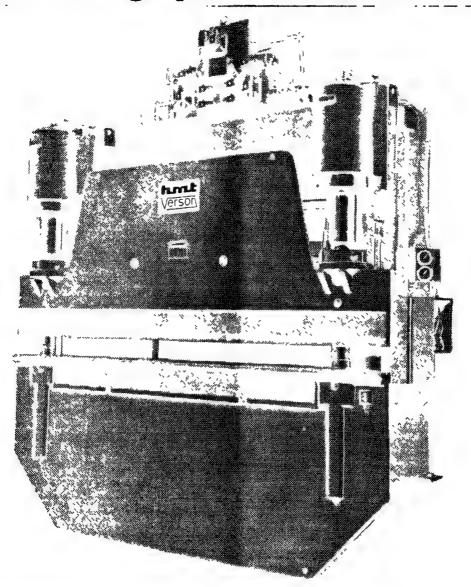
Other Services

OCS also provides programme transmissions, popularly known as 'voice-cast' to Press correspondents, News Agencies and Broadcast Organisations, for on-the-spot coverage of events. International Press broadcast transmissions and reception on behalf of News Agencies provide another service provided by O.C.S. □

DEMOCRACY

DEMANDS

DISCIPLINE

If your problems are pressing-here's our low cost high-performance solution:


Performance, durability, long life, economy – all these advantages are yours with the HMT range of Hydraulic Press Brakes.

HMT's Hydraulic Press Brakes are more rugged in construction, smoother in operation – yet are competitively priced. HMT has Press Brakes to meet your requirements anything from 200 tonnes to 1,000 tonnes

4 unbeatable features of the HMT Hydraulic Press Brakes which make them unbeatable.

1. Bed, ram and housings are made from heavy steel plates, cut to shape, interlocked, welded, stress relieved and machined to ensure perfect alignment at all times. All sections are thick and deep to ensure minimum deflection under full load
2. The hydraulic circuit has been designed for smoother operations. Full power throughout stroke with overload protection. Variable stroke length. Combination of fast advance, pressing and fast return speeds provided
3. Automatic ram levelling control which can equalize the applied power when work is performed off-centre in a left to right direction.
4. Adjustable back gauges

For further details, write to.

Solar Energy

Prospects and Problems

A. R. PATEL

Prospects of a fresh hike in the OPEC price of crude this December has imparted a certain urgency to energy planning in India. Total crude availability is placed around 29 million tonnes in the terminal year of the Fifth Plan, thus leaving an estimated demand gap of 7 million tonnes. Oil was the primary fuel used and it generated the highest quantum of energy in India. In this article the author deals with harnessing of solar energy in the process of rural development in India.

IN THE MODERN world, energy is derived largely from fossil fuels—coal, oil and natural gas. Hydro-electric power is becoming relatively less important and nuclear power is becoming more significant. So far as our country is concerned, coal is the most important fuel. Proven reserves in India are approximately 83 billion tonnes. From a current annual production of 70 million tonnes, it is proposed to increase it to a level of 135 million tonnes by 1978-79. As our coal resources are most important, we have to generate energy in the near future to a very large extent from this resource. However, as most of our coal is of poor quality with high ash and sulphur content, the need to develop economic refinement methods is obvious and vital. As our oil supply is dwindling, coal liquefication and coal gasification will also be very much important. We have, it is estimated, total oil reserves amounting to about 130 million tonnes. The current annual consumption rate is around 23 million tonnes The current production is only 8 million tonnes and the gap in supply is bridged through imports We have natural gas resources of about 66 million cft. During the Fifth Plan no substantial increase in production of these resources is possible. Since this source of energy is very limited, there is a need to develop a substitute for oil as fuel. Substitution of oil as a raw material for fertilizer production would prove to be a more difficult task especially with some of the existing plants. Even more difficult would be the substitution of oil as a raw material for the plastics and chemical industry Substitution of oil as fuel for aviation and road transport would not be possible in the near-future.

The hydro-electric potential that can be economically exploited is about 41000 MW The current production is about 9000 MW and by 1978-79, it is proposed to increase it to the level of 16000 MW. Hydro-electric power can be used largely for seasonal requirements of irrigation etc

The current installed capacity of nuclear power is 600 MW During the Fifth Plan, this would be increased to about 1000 MW With the currently available uranium resources and reactor technology, the total potential for nuclear power is about 5000 MW. An active atomic mineral exploration programme is planned through which it is expected that more uranium resources would become commercially exploitable. Simultaneously, the development of breeder technology is being undertaken in an accelerated manner so that more power can be generated from the existing uranium and thorium resources, but this is a long term possibility.

In the areas of non-commercial fuels, cow-dung, firewood and vegetable wastes constitute the major categories. These are at present mainly consumed for domestic use in rural and semi-urban areas.

The current resources for energy from solar power, fuel cells, geothermal wind or tidal sources are very limited. The development of solar energy and fusion technology are very crucial and probably this will be the predominant form of energy in the next century Large scale generation of solar power presently requires large amount of land and new storage techniques, but it holds promise as a long-term solution to the energy crisis, and has a huge potential in rural areas in conversion of agricultural waste into fertilizer and fuel. It has also in urban areas great potential for domestic heating and lighting purposes and desalination. In the future, even the world will have to rely heavily on this inexhaustible source of energy. Although no scientific efforts have been made to fathom the estimated quantum of available solar energy, it is well-known that it is available in billions and trillions of thermal units.

Use of Solar Energy

Five thousand million years ago the Sun was born on the edge of a spiral arm of the great Milky Way. An immense cloud of primal hydrogen swirled into an eddy, and gravity took charge. As all the gas fell towards the centre of the cloud, tremendous pressures and temperatures were created, and the nuclear fire was lit. This nuclear cauldron has been on the boil ever since, transmuting about 600 million tonnes of hydrogen into helium *every second*. In the process five million tonnes of hydrogen completely self-destruct, to fire a flood of X-rays and gamma rays and other high energy shortwave radiations, and create immense fields of electromagnetic force. This matter becomes the energy, including sunlight, which flows into space. The sun is colossal; with a diameter of 1.3 million km, it fills a volume one million times as great as our planet.

However, no appreciable efforts have been made anywhere in the world in the direct use of solar energy

Shri Patel is a freelance writer.

in industries and agriculture. Until now the actual use of solar energy has been mainly as animatic energy, both muscular and biotic in the form of food and feed, useful animal and vegetable products. While the use of sun-heat dates back to the birth of mankind, the first specific reference relates to the use of solar distillation for obtaining fresh water from brine in 1742 in Italy. Though such methods were in vogue even earlier in countries like Chile, France, Algiers and the U.S.S.R., the research on solar distillation was stepped up by the U.S A , the U.S S.R and Germany after the Second World War. At present many universities and research institutions/national laboratories in the advanced countries of the world are engaged in developing new designs for solar distillation plants.

Both Florida (U.S A) and Israel have been using solar water heaters for households, hotels, hospitals and laundries for their needs of hot water for bathing and washing for the past several years Unfortunately no statistical data are available in our country for assessing the quantity of fuel and electricity consumed for heating water for bathing and washing purposes If these were available, estimates of savings that could be realised, would have been possible It is however of great significance to have some idea of the magnitude of this field from the studies made in other countries It is revealed that 25 per cent of the energy consumed in the U.S.A at an annual cost of $ 18 million is for heating and cooling of buildings which includes supply of hot water in the households, laundries, hospitals and hotels. It has also been estimated that the solar heaters operating in Israel save them 60,000 tonnes of liquid fuel annually Considering that the population of Israel is about 3.25 million whereas our population is over 600 million and the total energy consumed in our country is 500 billion KWH (1968-69).

There is no doubt that we are consuming very large quantities of fuel and electricity annually for supplying the hot water needs of households, hotels, hospitals and laundries. Experience in Israel for more than two decades has shown that a solar water heater effects a saving of 70 per cent on electricity consumption in the course of a year. The shortfall of 30 per cent is accounted for by the necessary provision that has to be made for heating water during periods when solar radiation is not available due to rains and heavy clouds. India is one of the most favourable zones which has been receiving radiation. Several other countries, less favourably situated than ours, have made wide use of solar water heaters during the last two decades and found them more economical than other appliances for heating water for household purposes. If solar water heaters are extensively used in our country, there would be considerable saving of electricity, kerosene, fuel-oil, charcoal etc. presently used for these purposes. Another advantage that would be had in this process is the reduction in atmospheric pollution.

The other areas where intensive application of solar energy could be made in our country is agriculture. Need for energy to be employed in our agriculture for various purposes has been ever increasing in the light of the fact that we have to double our food output to 230 million tonnes by 2000 A.D Crop growth and yield principally depend upon the most efficient use of soil, water, nutrients and sunshine. Of these, modifications in the first three factors would be made as they are within the easy reach of the farmers The crops, however, entirely depend upon nature for the sunshine Sunshine or light, as we call, it, is necessary for photosynthesis- -the process upon which virtually all life on earth has to depend It is estimated that the crop surface can receive 500 Cal/Cm^2 of radiation per day and with this, the potential productivity can work out to 770 kg/ha/day or 281 tonnes ha. of dry matter per annum Considering the grain to straw ratio as 0 6 , the grain yield could be estimated to be 168 tonnes per hectare It is this area which our agro-biologists/crop-physiologists can explore to bring radical and metamorphic change in the genetical make-up of the plants which may increase their leaf area index and ultimately result in substantial increase in yields For example the coconut is a crop which can harbour a number of shade tolerant crops in between them.

An additional advantage of the coconut tree is that it has got only one main stem and the canopy is away from the soil. The leaves are so arranged that a lot of sunlight passes through the leaves. Hence many plants can be grown under the coconut palms. This is one area where efforts could be made to harvest most efficiently and effectively. Perennial crops like nutmeg, cloves, cinnamon, cocoa etc. could be successfully grown in coconut gardens. Annual crops like banana and tapioca can also be cultivated successfully.

The timeliness in harvesting, threshing and drying of field crops is an important consideration for higher yields and quality of crops like paddy, maize, wheat, sorghum and millets. Harvesting, threshing and drying operations are done by employing manual labour. Many a time adverse climatic conditions unseasonal rains and cyclones affect not only the quality produce but also result in drastic reductions in yields. Drying operation is of greater significance since it is scientifically established that storage of farm produce especially like groundnut, wheat, maize etc has to be done after properly drying them at a particular temperature such that the moisture percentage is kept below the specified level. If this is not done, the produce is attacked by a host of disease-causing organism The traditional practice of drying the produce in the fields and courtyards by direct exposure to the sunshine involves the risk of damage due to weather as also losses due to rodents, birds etc. Moreover, sun-drying is not effective for kharif crops, particularly in areas of high rainfall This method is laborious and time consuming which also results in wastage of produce. Now mechanical driers are available in some parts of the country. However, the source of solar radiation needs to be exploited efficiently on a wider scale for drying field crops by evolving sun-driers It is interesting to note that the Indian Agricultural Research Institute has been conducting researches on designing solar energy collector-cum-dryer for drying harvested crops. It is demonstrated that the construction of a solar drier is fairly simple and can be fabricated by a village artisan.

The cost of a 3-tonne capacity solar drier is about Rs 1200 which can even be reduced by 30 per cent if the collectors are fabricated on the roofs of farm houses, storage godowns and livestock shelters. The additional advantage that can be secured is that such collectors would protect the inhabitants from the solar heat during the summer and also help in room-heating during winter-season.

The fruits and vegetable crops

which play a very vital role in providing much needed vitamins and minerals have to be properly canned/ stored in the season of plenty to make them available in the season of scarcity in any part of the world. Thus, now-a-days cold storage industries' growth has been gathering momentum. This industry offers potential scope for the employment of solar radiation which can be used in the interior villages that cannot be electrified. The Punjab Agricultural University has been experimenting on the commercial utilisation of solar energy for the purpose of running cold storage for vegetables and fruits.

The availability of solar radiation in Rajasthan with about 3200 hours of bright sunshine received in a year is the maximum when compared to other parts of the country According to a study, the solar energy impinging upon the earth and its atmosphere is about 32000 times greater than the total amount of energy being utilised from various sources. It is thus necessary to find a cheap method for collecting this energy and employing it fo ruseful purposes The solar distillation can be a useful and successful method for water supply in Rajasthan where instead of natural fresh water, saline water is available. Saline water together with high concentrations of fluorides, which is a distinct feature of the Rajasthan water table, has no better solution than solar distillation for making fresh water available to a large number of people in remote areas who for years have been facing this problem

Mahatma Gandhi correctly stated that the salvation of India lies in its villages. However, limitations in regard to extending electricity or making available fuel as a source of energy in the villages have posed many problems and challenges of rural development. The solar radiation which is universally available in all the villages for quite a good number of hours in a year need to be scientifically exploited as a natural and cheap source of energy for running pump-sets, gobar gas-plants, small scale units and conducting agricultural operations. It is gratifying to note that of late the Department of Science and Technology has been working on projects which involve the use of solar radiation for developing dry-milk powder units, space heating equipments etc. Recently under the Indo-German Co-operation agreement, pioneering experiments to develop the solar units has been signed. Under the agreement the West-German Government has earmarked a million DM (1 DM - Rs. 3.40) for the enterprise. Sunshine stations producing 10 to 100 KW of power have been proposed to be set up in villages where pumps can be energised for irrigation and cooling system for food preservation.

Some of the experiments conducted in tapping solar energy have yielded promising results and provided new directions in seeking solutions to various problems experienced in Indian villages. However, large scale experiments/ innovations on scientific lines need to be conducted to demonstrate the utility and efficiency of the units developed. In these endeavours national laboratories, regional research institutes and State experimental centres should concentrate on harnessing solar radiation. Detailed techno-economic studies of the solar water heaters, solar stills (desalinators), solar driers (air heaters), solar air-conditioners and power pumps need to be immediately undertaken since these and similar developments have a variety of domestic, agricultural and industrial application. A few of the pressing problems inhibiting the large scale use of solar radiation for various important uses where interruption of the availability of power is likely to cause substantial loss/damage as indicated below, should be tackled on priority basis

(1) Though the sun is the very source of life on earch, the rotation of the earth on its polar axis and its movement on the ecliptic orbit inclined 23.5° to the earth's equator, makes any recovery of the solar energy very complicated. (2) Rain and clouds make it unreliable to base any industry on solar energy. (3) Since the plants employing solar radiation are exposed to sun and rain, they have to be protected with anti-corrosive material. (4) Initial capital cost for developing various equipments is prohibitive. Efforts will have to be made to reduce the cost by employing the locally available materials in specific areas. (5) Meteorological Department of the Government has more than a 100 stations where the duration of sunshine is continuously recorded and of these 37 stations record the total radiation received at the place at the same time. However, a solar map of India is a first pre-requisite. (6) What sort of impact the different projects could make on the energy economy in India? (7) What percentage of energy substitution could one expect to make through solar power on long term basis?

It is gratifying to note that the IIT, Madras, the West German KFA and the Bharat Heavy Electricals have been working out a project which involves building of a 10-Kilowatt solar power house. The German expert has stated that solar energy could be a good source of power for India with its abundant sunshine. The successful completion of the proposed solar power house could one day result in solar power plants in many rural areas for energising irrigation pumps and providing cooling facilities for food preservation. It is estimated that even a 500 KW solar power generator if used in India on a mass scale would change the energy profile throughout rural areas as 80 per cent of it receives sufficient sunlight to run it for 7 to 8 months. About five lakh generators in India would generate 2.5 lakh KW of power which could be equivalent to 12 times the aggregate power generation capacity of India today. In 28 years, we have hardly been able to electrify 15 per cent of villages in India. If in the next ten years, we electrify 80 per cent of these through solar energy it would be our greatest achievement. A group of top Indian scientists appointed by the National Committee on Science and Technology (NCST) has suggested that the solar cell generation of electricity can be 'quite economical' in India and it can transform the rural scene completely. The group has aptly recommended the setting-up of a solar energy commission entrusted with the task of solar energy programme in the country for funding research and development programmes, for disseminating information in the field of solar energy and for popularising and promoting applications of solar energy. The need for setting up National level Solar Research Institute and drawing up an integrated programme is imperative.

The non-availability of cheap and adequate energy is the chief constraint in the process of rural reconstruction and re-order ing the rural economy. In the final analysis, therefore, the solution to this problem has to be sought in the commercial application of the greatest natural sources of energy—the solar energy.

Interdisciplinary Studies

Social Sciences in Professional Education : Agriculture, Engineering & Medical, *ICSSR, New Delhi,* **1976;** *Price Rs.* **60;** *Pages VII* **+ 493.**

THIS volume represents the edited proceedings of a Conference sponsored by the University Grants Commission in 1969 with the joint collaboration of the ICSSR, ICAR, and the All-India Council for Technical Education (AICTE). For the first time, a serious effort was made to identify and assign a precise if feasible role under prevailing conditions for the social sciences in three very important professional areas where the need for inter-disciplinary approaches has been insistently felt. While there has been a growing awareness about this need, concrete steps appear to have been taken only now.

There is no doubt that confusion of thought has all along persisted regarding the matching of disciplines and subdisciplines for research purposes in so far as most people who stoop to do researches lack the sure grasp of the proportion of the ingredients to the alchemy. Hence, more of unpalatable *pot-pourri* rather than thought provoking treatises have resulted in a large number of cases, in the form of doctoral or other academic efforts. The case for introducing inter-disciplinary studies has eventually not received its due share of attention on account of its unintended lapses, rather than due to the lack of grasp of its intrinsic logic at present.

In this volume Agriculture, Engineering and Medicine have received their due share of attention in their respective fields. Basically, the effort may be characterised as a major tentative to apprehend social reality i.e. the new and emerging facticity under dynamic political leadership. Evidently the assumption behind this effort has been that unless the disorienting and alienating trends implicit in the educational technology covering these disciplines are halted, the very purpose of higher education alongside professional practice and ipso facto the benefits thereof to the larger community in India would be vitiated. While the origins of concepts, principles and programmes underlying education in these disciplines have been the ineluctable resultants of distorted Western education, the various working papers of the discussion thereon have focussed on Indian conditions and our institutional goals. The policy maker's requirements have also been kept in view. Whether this will lead to a reorganisation of the pattern of services other than the endeavours to strengthen the doses of training given to the functionaries of technical de-

Books

partments is a larger issue on which the Conference could not have projected its deliberations. There is, however, unmistakable evidenc that an evaluation is overdue not merely in building a corpus of knowledge but in making them administratively oriented.

The reports of the Working Groups albeit reflecting a broad consensus on the role of social sciences in relation to the respective disciplines, are neither uniform in depth nor comprehensive in coverage. These are indicators of the extent to which a conference of this nature could mobilise scholars in the fields while facing the inexorable limitations imposed in their choice based on their inter-disciplinary popularity on the one hand and expertise, on the other. Viewed in this manner, the relative degree of attention received by the aspects of supplying a teaching focus to social sciences, its administrative organisation including discussion on core Faculty and *adjunct* Faculties, personnel policies and the preparation of syllabi, leaves much to be desired. The strategy of providing the social science inputs was the weakest in the discussions on agriculture, reasonably well-balanced and pragmatic in regard to engineering education and the strongest and well-conceived in medical education. This also shows to some extent the prominence of certain view-points held by leading members of academics and participants from other walks of life. The interplay of vested interests, the pranks of instant scholarships and hidden fears of blunting the edges of the careerist drives of a conglomeration of highly educated people capitalizing on their foreign degrees are the main parameters here.

Understanding the social phenomenon and explaining them in scientific terms have not posed problems to our Indian scholars hitherto in so far as they already happily combine a *penchant* for metaphysics and the pragmatics of science education. What proved itself to be the biggest road block, however, has been the problem of transposting these qualities into administrative policies governing socio-economic planning. There has been unmistakably improvements in perspectives in this direction and a multifaceted development in organizing and integrating thought in the country. By contrast, the impatient coteries of quantifications decry the efforts as they continue to move in the narrow disciplinary grooves and do not like to expose their bankruptcy in humanistic orientation. When the basic disciplinary spectrum that forms the requisities for competitive examinations undergo a change, the required emphasis in achieving motivations among the youth of the country is bound to be ushered in and herald change in community goals and social services. Fortunately, this is becoming a reality in contemporary India.

The ICSSR and the U.G.C. deserve high praise for this effort. However, circumstances appear to have conspired against the appearance of this volume intime. It is also desirable to bring out this type of publication in cheap paper backs and also in vernacular language for the benefit of the reading public. Overall, the volume under review represents the quintessence of the maturity and wisdom of the All India organisations that are unassailable by international standards.

Mechanism of Labour Market

Wage Structure and Labour Mobility in a Local Labour Market. *by T.S. Papola and K.K. Subrahmanian; Sardar Patel Institute of Economic & Social Research, Ahmedabad,* 1975; *Pages* vi + 214; *Price Rs* 45.

ANALYSIS of labour market along the line of skill, occupational distribution, wage structure and the mobility of labour assumes significant importance in view of the persistent severity of unemployment Generally much irrational element prevails in the wage structure of the industrial economy. But for the rapid industrialisation of the economy, it is essential to standardise the wage structure. As labour perishes if not utilised, it becomes all the more imperative for the worker to accept whatever wage is available which introduces greater imperfection in the labour market Inspite of all the drawbacks, labour market behaviour is determined by certain economic considerations. But absence of information regarding the factors which influence the working of the labour market makes its working all the more arbitrary.

The present study fills this gap to a considerable extent. It studies the efficiency of the mechanism of the labour market. The reason for selecting the local labour market is obvious as the authors have rightly pointed out that due to various well-known socio-economic barriers to mobility and lack of information channels, a well integrated labour market has not taken shape on the Indian scene. Further the conditions prevailing in local labour market have not come under investigation, though such information can be a much better guide for laying down policies for the labour market.

The socio-economic surveys of different regions only portrays the requisite information without any analysis, while the present study tries to investigate into the rationality of worker's behaviour. For this analysis authors have taken considerable pains in processing ample amount of data which has helped considerably in pro-presenting a clear picture of Ahmedabad labour market.

The study is confined to Ahmedabad Municipal Corporation area and relates only to organised sector of manufacturing Industries It takes accounts of only employed factory workers.

The study relates to the year 1971-72 and its analysis is based on 0.7 per cent of the total factor employment in Ahmedabad (Page-16). With such a small sample, it is doubtful how far the conclusions arrived at can be justified.

Anyhow the authors should be given due credit to present a detailed analysis for various aspects of the labour market, wage differentials of different types, mobility of workers and different types of institutions in the labour market and have been able to arrive at uniform conclusions.

The study is well planned and systematic. The first chapter gives the objectives, scope and method of the study. The second one deals with the measurement and analysis of the various types of wage differentials. The third chapter presents the analysis of mobility among workers while chapter four deals with the process of relationship between wages and labour mobility as well as the information network and recruitment procedures in the labour market, and the final chapter summaries the findings, evaluates the performance of the Ahmedabad labour market and points out certain implications for labour market analysis and policy.

The conclusion that a local labour market is not an integrated competitive unit brings out conclusively the need for the standardisation of wage structure through the joint action of the Government, industry and trade unions.

It is not easy to digest the conclusion that the factor of mobility does not always bring gain to the worker and it is because of its rational behaviours that the Indian worker lacks mobility It is argued that a worker has a price and mobility cannot change it The question arises whether geographical, social and the capacity to pay of a particular unit has some effect on the wages or not It is rightly ascertained that the official industrial training programme is of no avail if the capacity and occupational allocations in the training institutes are not based on and frequently revised in accordance with the labour market situation

Saving Young Lives

(*Contd. from page* 19)

percentage of susceptible children in a country is to provide adequate staff to deliver medical care at the family level. This cannot be achieved overnight but a great deal can be done – first by training primary health care workers to include vaccination as one of their important duties, by improving logistics and cold chains by the simplest possible methods so that vaccines can be supplied in good condition; by arousing the interest of communities and decision-makers in the great benefits which are obtained at relatively small cost; and by enlisting outside agencies to assist the national authorities, so as to accelerate the development of their programmes by providing expert advice and essential supplies in the early years

Countries are finding that by good organisation and good management they can alredy substantially increase the coverage of the susceptible age groups with minimal additional inputs

Given concentrated effort on practicable methods for delivering vaccinaiton to those who need it, we can look forward to a rapid reduction of these six diseases □

India has an excellent record of fight against inflation and the determined measures taken have resulted in immense benefits to the nation's economy. But we are seeing again the ugly face of inflation and if the trend is allowed to gain strength, the economy will be in the doldrums. What we need is a new

Strategy to Arrest Re-emergence of Inflation

V.K.R.V. RAO

INFLATION IS AN UGLY economic phenomenon that hides its ugliness behind a cloak of high money incomes that create an illusion of prosperity. In fact, the reality behind the phenomenon is high prices that brings about a sharp reduction in the purchasing power of the currency unit, with not only an erosion in living standards of consumption goods and services, but also in savings which forms the key to a growth in living standards in the future. The rise in money incomes is also most uneven and results in a transfer of real income from workers, salary and wage earners to traders and producers who have surpluses to sell. Subsistence farmers and low income producers also suffer because they have to pay more for what they buy, while they do not have much to sell. In fact, inflation functions as a most inequitable and regressive form of taxation without in any way promoting development. Inflation, when it gets going, has an awful tendency to accelerate by feeding itself and when it becomes hyper-inflation or gallopping inflation, it means death of the economy. That is why heroic measures have to be taken to counter inflation as soon as the rise in prices takes on the character of an inflation.

We in India were facing exactly such a threat, when the gradual rise in prices for a number of years turned into an inflationary rise in 1973 and then threatened to develop into a hyper-inflation in 1974. Strong political will, an integrated fiscal and monetary policy aimed at demand management, positive action for increasing output, a judicious import policy, public distribution of essential goods, and specific measures aimed at controlling individual prices – all are required if inflation is to be met and price rise arrested if not actually reversed.

It is to the credit of the Indian Government that the inflationary threat which dominated the Indian scene during 1973 and 1974 was countered even before the declaration of Emergency in June 1975 and this continued with success during the next 12 months when we were living under the Emergency.

Even before the Emergency was announced, strong action had been taken in the field of demand management and the index number of wholesale prices, which had reached a peak of 328.0 in September (with 1961-62 as 100) fell to 312.3 in June 1975 or by nearly 5 per cent. The first 12 months of emergency saw a further strengthening of anti-inflationary measures, with not only more vigour and political strength behind its enforcement, but also broadening out into the field of supply increase and supply management and bringing about a further fall in the wholesale index, the figure for the week ending June 12,1976 being 294.4 as compared to 312.3 in June 1975 or a fall of 5.8 per cent.

In this task of countering inflation, monetary policy aimed at reduction in the growth of money supply both currency and bank advances, and fiscal policy aimed at reducing the growth of monetary purchasing power, played a major role during the earlier stages of the programme. Mobilisation of additional resources by the public exchequer and restraint in government spending also helped. Anoth[illegible] factor that played a crucial role i[illegible] curbing inflation was the driv[illegible] launched against smugglers, ta[illegible] evaders, violators of exchange re[illegible]gulations, and hoarders of commo[illegible]dities. This resulted not only in a[illegible] augmentation of both domestic an[illegible] foreign exchange resources of go[illegible]vernment, but also struck a morta[illegible] blow at the phenomenon of black money which had served as a criti[illegible]cal fuel to stoke the fires of infla[illegible]tion.

Nature also sent a helping han[illegible] in our attempt to counter inflation. The monsoons were on their bes[illegible] behaviour and were reinforced b[illegible] a larger supply of inputs of credi[illegible] and fertilisers and an improve[illegible] agricultural management. The re[illegible]sult was that 1975-76 saw a pheno[illegible]menal increase in the productio[illegible] of foodgrains and of industrial ra[illegible] materials and a sharp fall in th[illegible] prices of primary commodities. This increased production of food grains was followed by an all tim[illegible] record of increased domestic procure[illegible]ment. And, together with addi[illegible]tional imports, we have now bee[illegible] able to build up a buffer stock o[illegible] more than 17 million tons, which is more than a year's supply fo[illegible] servicing the public distributio[illegible] system. The latest estimate for th[illegible] holding of foodgrains in government hands is 22 million tons. This big buffer stock together with th[illegible] sharp reduction in black mone[illegible] are the most effective instru[illegible]ments we have for countering re-emergence of an inflationary rise in price levels.

Countering inflation, however, is only a negative aspect of economic

Policy. On the industrial side, measures have been taken for improving the utilisation of capacity, modernisation of equipment, and expansion of capacity by the relaxation of licensing rules and regulations governing both the use and expansion of capacity and by the broad range of fiscal incentives given in the pragmatic budget of 1976-77 for the benefit of the private sector in industry. The climate and capacity of the industrial sector for increased production have also been substantially improved during the period of emergency by the new discipline and attitude to work it has created, the absence of industrial disputes and of stoppages it has promoted and by the increased availability of power, transport, and import facilities during the period.

While all this has been helpful in curbing inflation and stimulating the climate for increased production and investment, recent trends have shown that the economy is not yet out of the woods. In fact, after one year of emergency, we are facing some of the contradictions and paradoxes in the Indian economy for which a solution has to be found. Thus, for example, one of the aftermath of the anti-inflation programme has been a decline in demand for a large number of industrial products catering to both consumption and investment requirements and the continuing cry of recession that is being raised by the private sector and the demand it is making for reflation and even for a mild dose of inflation. Government have responded to some extent by making liberal concessions in excise duties, reducing direct taxes on income and wealth, introducing an investment allowance, raising the plan outlay, and permitting repayment of the additional wages and half of D.A impounded in 1974. They have also increased the availability of funds for the private sector by the Voluntary Disclosure Scheme that has legitimised more than Rs. 400 crores of income and about Rs. 600 crores of wealth by payment of taxes on the disclosed amounts. They had however been firm in refusing to relax credit controls on the lines desired by the private sector nor have they succumbed to the pressures exercised by the farmers' lobby for an increase in procurement prices. The increase in purchasing power resulting from government policies is expected to raise demand and presumably, may lead to a rise in prices unless the increase in output which is expected actually takes place and has the effect of countering such a price rise.

Another paradox in the Indian economy in the context of counter-inflation is a result of the very success we have attained in our economic policy, namely, an increase in exports and an increase in our foreign exchange earnings and our foreign exchange balances. Our export promotion policy has achieved signal success; exports rising by 18 per cent during the emergency year as compared with less than 8 per cent in the world exports. Our foreign exchange balances have also swelled to a phenomenal figure of nearly 3 billion dollars partly because of increased export earnings, but largely because of vastly increased remittances from abroad and increased foreign aid. And this is in spite of the fact that our commodity exports are still far short of our commodity imports. The increase in exports has affected domestic supplies and also led to speculation with inflationary consequences. It is also well known that a large foreign exchange balance, while lending strength to the currency and thus permitting a measure of cheapening of imports, also has an inflationary bias by the domestic incomes that are created as a result of the purchase of foreign exchange by the Central Bank from domestic sellers.

Recent Disquieting Trends

In the context of the success we had achieved in arresting inflation and then reversing it, recent price trends are showing a disquieting tendency. And in fact, danger signals are again in evidence on the price front. From the trough of 282.9 which had been reached in March 1976, the wholesale index had risen to 294.4 by the second week of June 1976. In terms of the revised index number with its new base as 1970-71, the rise was 8.9 points from 162.6 in March 1976 to 171.5 in June 1976 since then prices have risen further, reaching 179.8 in February 1977 or by 8.3 points. If we take the period from February 1976 to February 1977 or look at the price rise from point to point over a period of one year, the rise has been from 164.8 to 179.8 or by about 9 per cent. There is no doubt that this is a disquieting phenomenon, a rise of nearly 9 per cent during the current year as compared to fall of 6.4 per cent in the corresponding previous year. The rise cannot be dismissed as a seasonal phenomenon, as the period covered is a whole year and from point to point.

I find it difficult to explain this phenomenon in the light of the unprecedented increase we have had in foodgrain production during 1975-76 (the latest estimate of output is 120.8 million tons), the large buffer stocks we have built up amounting to nearly 18 million tons, the increase of about 10 per cent in the index of industrial output, and the large capacity we now have for financing imports because of the massive build up of foreign exchange balances. It is true oil seeds and fibres account for a large part of the rise, but food articles in the primary list of the index also show a rise of 3.7 per cent, while manufactured products as a whole show a rise of about 8 per cent, mainly in consumer goods like edible oils, textiles and leather manufactures. Prices of manufactures have thus continued their behaviour of a rising trend seen during the emergency, while those of industrial raw materials have sharply reversed their falling trend during the earlier period of the emergency, and of foodgrains also, though not as sharply as industrial raw materials. There has been substantial increase in agricultural output and in industrial output, but this does not seem to have reacted on their price behaviour.

In short, while inflation has been countered, and in fact reversed during the year 1975-76, the last three months show that the process of countering inflation has not been completed. In fact, the old and presumably vanquished demon is showing signs of renewed life, gaining encouragement partly from the contradictions and paradoxes in the Indian economy and partly from the somewhat unfavourable behaviour of the Kharif monsoon this year. To prevent the demon of inflation from rising again and to complete the work of countering inflation and at the same time promoting growth and investment, I suggested in July 1976 the following policy measures for consideration:

1. A more selective policy regarding exports in the context of the domestic supply situation.
2. More recognition from the private sector in industry that it is no longer functioning in a sellers' market and therefore the need for greater readiness on its part to increase output, lower prices and go in for a

Yojana Quiz

1. The highest airfield in India is:
   (a) Gauhati
   (b) Imphal
   (c) Ladakh
2. The biggest library in the world is:
   (a) National Library, Calcutta
   (b) United States Library of Congress
   (c) Oxford University Library, U.K
3. The highest rainfall in the world is at
   (a) Mt. Waialeale, Hawaiian Islands.
   (b) Cherapunji, India
   (c) Zomba, Malawi
4. Why does a horse need shoes?
5. What is the length of a year of Pluto and Mars?
6. Which planet is having the largest number of moons?
7. When did India win the football event in the Asian Games?
8. Who scored the first century in Test cricket?
9. In which year Mughal Emperor Shah Alam granted Dewani of Bengal, Bihar and Orissa to East India Company?
10. India was admitted in U N. as a member on the 30 October, 1945. In which year Pakistan was admitted as a member?

ANSWERS

1. (c) Ladakh airfield, Kashmir 14,230 ft above sea level
2. (b) United States Library of Congress, Washington D.C It contains over 41,874,900 titles.
3. (a) Mt. Waialeale, Hawaiian Islands 450 inches, 1912–58
4. The loops of iron nailed to horse's hoofs are necessary because th hard roads along which they are driven would otherwise wear aw the horn of the hoof. Also, the hoofs of horses driven along dr roads become dry and unhealthy through lack of moisture – th wild horses bathe the ir feet every morning in the dew of the gras which keep the hoofs healthy and tough
5. 248 years and 88 days
6. Jupiter : 12 moons.
7. In 1951 and 1962
8. C. Bannerman of Australia
9. 1765
10. 30 September, 1947

policy of aggressive salesmanship, instead of expecting government to bail them out with larger markets at higher prices.

3. Greater recognition by all concerned that the Indian economy is moving from a class market to a mass market ond acceptance of the action requirements arising from such a recognition.
4. A more liberal use of our foreign exchange balances and a more flexible import policy designed to curb emerging inflationary pressures in the economy and promote modernisation of equipment and expansion of capacity
5. More vigorous action by government for curbing speculation, especially in industrial raw materials.
6. Firm and continued adherence to a policy of selective credit control and restricted deficit financing

I am glad that government have taken action on the lines contained in points 1 and 4 of my six point programme for countering the re-emergence of inflation (I do not claim the credit for this action) by restricting exports of goods in short supply and liberalising imports for increasing the domestic supply of goods in short supply and increasing the capacity to produce goods in domestic short supply But action on point 5, namely, curbing speculative activities, has been tardy and ineffective, while on point 6, government is succumbing to the pressure of the business community for liberalising credit and of plitical pressure for reducing the burden of taxation, and increasing public expenditure, thereby increasing the risk of adding to deficit financing. Points 2 and 3 relate to the private sector, and the private sector has not behaved in showing willingness either to reduce prices or change its orientation from the class goods market to the mass goods market. The private sector seems to see the remedy for inflation in more additions to purchasing power by credit and fiscal liberalisation on the plea of demand recession, and appears oblivious of the fact that demand is linked to price and that reduction in price is one way of increasing demand. Government is setting stoie on the rise in the industrial index and its massive buffer stock of foo d grains and its vast exchange resources but has not so far been able to make

The importance of sea weeds as a nutritious human-food is realised all over the world and research is now in progress to find out their possible utilisation for consumption by human beings During the years of food-crisis, the seaweeds will surely able to occupy a position of importance and serve mankind. The present article deals with the algae which occur in sea-water and how it can be utilized as food, fodder, medicines and fertilizer.

Industrialisation of Sea Weeds

U. C. PANDEY

SEA WEEDS are the algal flora inhabiting the seas. Algae are the most lowly of the green plants. It is a group of heterogenous plants which can grow in fresh water or saline sea water. Microscopic marine algae (*Diatoms* and *Dinoflagellates*) are unicellular, free-floating organisms, which are incapable of moving against the current in which they live Microscopic algae referred to as "Sea Weeds" belong to Phaeophyceae, Rhodophyceae, Chlorophyceae and Cyanophyceae, are large and multicellular structures

Sea weeds may vary from a few inches to hundred feet or even more in height as giant kelps (Macrocystis, Nereocystis) They generally occur along the rocky coasts of the temperate regions in both eastern and western hemispheres Industrial utilisation of sea weeds started principally from Europe in the production of kelp. "Kelp" is the name that originally referred to the ash, rich in soda and potash, derived from burning of sea weeds Kelp production was started by French peasants in 17th century. Drift weeds (*Laminaria, Saccorhiza, Fucus, Ascophyllum, Himanthalia* and *Chorda*) were first used.

In Japan Iodine is produced in commercial quantities from sea weeds. In U S A wartime demands for potash and acetone during 1917-18 brought about rapid industrialisation of Pacific coast Macrocystics beds

Algin is the general term designating the hydrophilic derivatives of alginic acid Algin is commonly used in the form of its salts namely Na-alginate, K-alginate, NH-alginate and propylene-glycolalginate Algin occurs in brown algae as cell wall constituent is especially prominent in Laminariales (*Laminaria*) Algin has remarkable water-absorbing quality that make it useful in numerous industries where a thickening, suspending, stabilizing, emulsifying, gel-forming or film forming colloid is required.

Sea weed extracts are mainly the constitutents of the cell wall of red or brown algae, however, *mannitol* and laminarin are believed to be photosynthetic products. Mannitol is used commercially in the manufacture of resins, paper, paints, varnishes and Match trades Laminarian is used in pharmacy

Since 1882 the agarophytes have become increasingly industrialised and the technical uses of agar-agar enormously expanded. Agar is a colloidal water-soluble gel extract from *Gelidium, Gracilaria, Pterocladia Ahfeldtia, Gigartina* and *Eucheuma* etc The extract has a peculiar property that makes it an ideal medium for culture of micro organisms. Agar is used as stabilizer and gel forming substance for jellies, ice-cream, chocolate in bakery and textiles Earlier industrial uses of agar in the orient included sizing paper fabrics, water-proofing paper and cloth and making rice paper durable.

Carrageenin, a phyco-colloid o rapidly increasing industrial utility is mainly obtained from *Chondrus crispes* and Gigartina stellata In agriculture, sea weeds are used as manure and fertilisers. Burning the weed and using the ash is an al ternative practice in China, wher the ash is used as fertilizer. Sea weec ash is found to be nearly as rich ir N and organic matter as farm yarc manure, twice as rich in potash poorer in phosphate and richer ir common salt, (NaCl). Sea weed are used as fodder in coastal areas The important species used fo this purpose include *Rhodymenia Palmata, Fucus, Ascophyllum, Lam inaria* and *Alaria* etc Sea weec meals are considered to be valuabl for domesticated animals. Fo poultry, sea weed meal can be sup plemented in the diet of egg-laying hens. It is valuable as a universa supplement against Iodine, Liqui extracts are used as fertilizers Ir some Coastal areas (Europe) coralline algae such as *Lithothamnio Lithophyllum* are used

Sea weeds have been described in the Chinese literature as a "Delicacy fit for the most honourable gues even for the king himself" *Porphyt* is used by Europeans in making soups In Japan sea weeds are taker as main meal "Kombu" obtained from Laminariales is a standard food item there "Amanori" is another preparation from sps of a *Porphyra.* Marine algae are used as food since they contain grea amount of minerals and vitamins The diatom *Nitzschia* very rich in vitamin A is possibly the main

Shri Pandey belongs to the Botany Dep., Bareilly College, Bareilly

their impact felt on price behaviour Meanwhile, the danger of an inflationary rise in prices re-emerging in the Indian economy is becoming a matter of real concern, especially in the context of the additions we are proposing in the plan outlay, which of course has its own justification in the need for sustaining economic growth

I would therefore reiterate the need for implementing the six point programme I outlined in July 1976 and add to it two additional but major items, namely, the setting up of an effective system of public distribution of essential wage goods and the avoidance of populist measures that would add to purchasing power while making no offsetting additions by way of increase in mass wage goods output. Prices should be used either for increasing the desired output or for curbing increases in demand for socially non-essential output, while simultaneously action is taken on other fronts to increase the output of mass consumption goods and curb the output of luxury and class consumption goods In any case, prices should not be used in the mistaken and psuedo- Keynesian belief that increase in general purchasing power and rise in general prices will lead to increase in demand and increase in output. ☐

FOOD VALUE

A preliminary study of the nutritional aspects of some Indian sea weeds (Neela, 1956).

Species	Dry Sea Weed								Fresh Sea weed
	Moisture g/100g	Protein g/100g	Fat Mg/100g	Ca g/100g	P. mg/100g	Iron mg/100g	Iodine mg/100g	Calories	Vit. C/ 100g mg.
Gracilaria	14 8	7 6	170 4	0 7	50 0	30 02	29 2	330	7.3
Gracilari a Lichenoides	14.9	7 67	365.0	0 83	53 3	292.5	56.2	300	—
Hypnea sp.	18 7	7 5	70 0	1 3	101 7	112 1	44 2	270	8 6
Ulvalactuca	21 0	5 6	430 0	1 6	56 3	114.1	43 2	250	6.1

source of vitamin found in fishes, Vit. B is found in *Ulva Porphyra* etc. and *Alaria* is rich in Vit. C.

The high food value of various brown algae is perhaps due to the fact that they contain 6.15 per cent protein, 1.56 per cent fat and 57.04 per cent carbohydrates in various forms like Mannitol (5 37 per cent) Laminaria (36 per cent), Cellulose 1-9 per cent) and Algin (50 per cent are all digestible

For medicinal purposes sea weeds have been used since very early times in China, Japan and other Asian countries *Digenia simplex* (a red algau) is used as an antihelmitic. Sodium Laminarin sulphate is used as blood anti-coagulant. Agar is used in treating prolapsed stomach. In China and Japan, sea weeds were used in treating goitre Extracts of *Alsidium, Corallina, Codium,* and *Digenia* are used as effective vermifuge. Extracts of several marine algae (*Rhodomela Halidrys, Pelvetia Polysiphonai* and *Laminaria Digtata*) have also yielded antibacterial substances *Chondrus crispes* and *Gigania stellata* have long been used in Britain, as remedy for chest and stomach ailments.

Though Indian resources in sea weeds are limited and very small, their utilisation would be worthwhile as they contain minerals, trace elements and vitamins in a considerable quantity. Indian sea weeds can supplement the human food and stock food

A SOCIO-ECONOMIC SURVEY

Sikarpur Needs Government Help

Rural upliftment is still a far cry in this village which lacks basic amenities like a school, a dispensary and modern methods of cultivation.

INDRANI BASU

A socio-economic survey of the village Sikarpur sub-division Tufanganj, district of Cooch Behar in West Bengal, has brought to light a number of problems faced by the people in this village The total area of this village is roughly three-quarter sq. mile and the total population is 1,215. Of these 409 are male (33 72%) and 402 (33.08%) are female. Children constitute 33.25% of the total population Majority of the people are self-employed in skilled trades The village has only one kachcha P W D road, which becomes dusty in summer and muddy and slippery in rainy season

It is rather surprising that only a small number of people of this village are farmers By farmer is meant the person who cultivates his own land or the land of others and depends on agricultural income for his livelihood The people who farm here are illiterate and follow traditional system of agriculture which does not bring good harvests Hence the pecuniary condition of these farmers is not good and some are even unable to get a single square meal a day at times Our Government has done much for the improvement of agriculture of our country But somehow the farmers of this village have been deprived of the benefits given by the Government The reasons are mainly the ignorance of the farmers regarding the existence of these benefits and the failure of the Govermental agencies to apprise the villagers of the benefits available

For the improvement of the agriculture, village level workers, Gramsevaks, or N E S. workers or C.A D P. workers should be asked to go and work in this village. They could be even given booster bonus and other incentives for working in the village, as is being done in certain remote areas of Arunachal Pradesh and Andamans.

These workers could also be given an agricultural production bonus in proportion to the increased production obtained annually as a result of their efforts.

As the farmers become seasonally unemployed, the Govt. should arrange to train these farmers in some small cottage industry which should provide them with suitable part time employment in the agricultural off season

The farmers of this village mainly produce Aush paddy, Aman paddy and jute The soil of this village and climate of this place is such that it is not possible for the farmers to produce much Aush paddy. Hence, if the Govt inspires the farmers to sow wheat instead of Aush paddy, more production of grains will be possible Moreover, soil should be tested to help the farmers select the most suitable crop.

Problems of Daily Labourers

The plight of daily labourers in this village is very bad As majority of the persons of this village are poor there is hardly any scope for labourers here The only time their services are needed by the farmers is at the time of sowing The rate of wages is extremly low. The only people who are comparatively well off are the self-employed skilled workers.

There is only one primary school About 39 per cent of the people. in this village are literate Not bad considering the all India literacy rate. 41.58% of the children of this village go to school. This might lead one to think that the school is crowded with pupils. Hov this is not so, regular atten is not there. Most of the pa prefer their children to stay from school and help them wit daily chores at home or at the or in their other work Th because of the poverty of the p

If the Govt were to make pr education compulsory the pro would be solved to a certain e Better still, would be to educa parents through adult literacy d Once educated they would u stand the significance of educ and send their children to s inspite of economic distress.

Medical Facilities

The only hospital is at Tufa which is situated two miles from this village Besides this, people from nearby villages to this hospital for treat However, due to poverty and i ance the inhabitants of this vi for medical treatment go to the v quack. Only in severe cases do go to the hospital

The people of this village from various diseases. Their rings are mainly due to lac hygiene, proper drinking facilities and sanitation At th of survey it was found that a all the houses were dirty. was no latrine in most of the h As the majority of the village illiterate they are quite ig about diseases It was foun Syphilis patients or T B. patient mixing freely with other memb the family They were taking from the same utensils and each other's clothes They di know that these diseases ar tagious.

Our country is not so ri this stage that health centres c established in every village. ever the Govt can make so rangement for the training village quacks The Govt s also educate the villagers in hygiene and sanitation.

Development Notes

IDA Credit For Farm Project

The International Development Association (IDA), a world bank affiliate, has approved a $ 30 million credit for an agricultural development project to help small farmers in Kerala. The project, will help improve the income of some 75,000 farm families dependent on coconut, rubber, pepper, cashew and other tree crops. "Major benefits" will accrue from increased output resulting from intensified and improved agricultural practices on 30,000 hectares of coconut rehabilitation and 10,000 hectares of pepper rehabilitation, and 5,000 hectares of new coconut planting.

Improved processing facilities to be provided in ten rubber crump factories (nine would be new) will yield higher income to 50,000 small holders by upgrading the quality of some 25,000 tons of lowgrade rubber a year. Seed gardens to be established under the project and the provision of research and extension activities will yield "far-reaching benefits to small farmers" in the state.

Housing Loans To Farmers

A sum of Rs. 93.4 million has been sanctioned by the Rajasthan State Housing Co-operative Farmers Society to 23,791 persons in rural Rajasthan to construct houses. The loan disbursed so far is Rs. 37 million. A total of 8.16 lakh house sites have been allotted in Rajasthan to weaker sections and small farmers.

In urban areas, 15,692 house sites have been allotted to weaker sections at a nominal price. Besides, the title deeds have been issued under the State Grants Act to 13,460 persons. Out of 86,762 ceiling cases in Rajasthan at the beginning of emergency, declared surplus of 5.89 lakh acres have been settled. Under the land ceiling laws the Government has acquired 4.91 lakh acres. Out of 4.91 lakh acres of land acquired, 2.84 acres have already been allotted. Amongst scheduled caste and scheduled tribes, the allotted land is 1.25 lakh acres.

Major Road Programme Launched

A Rs. 900 million massive road construction programme has been launched in Uttar Pradesh to open up new vistas of socio-economic development in the sprawling rural areas of the state, particularly the economically backward pockets. Under this programme construction of about 9,500 kms of roads had been undertaken this year for which the entire PWD machinery had been geared up to achieve the targets as early as possible.

Roads being the only lifeline in the hill regions of the State, in the absence of rail and other modes of transport, a number of new projects had been launched in the eight hill districts for providing missing links and to connect important growth centres, fruit belts and places of tourist importance.

Talcher Fertiliser Project To Go on Stream This Year

The third boiler of FCI's Talcher Fertilizer Project in Orissa has been commissioned. The other two boilers are already in Operation. These boilers are to supply steam to meet the process requirements of the project.

The boilers have been supplied by Bharat Heavy Electricals Ltd., Trichy, a public sector undertaking, and erected by their contractors, the Hindustan Steel Works Construction Ltd. Each of these boilers is capable of producing 182 tonnes of steam per hour at a high pressure of 95 kg per square centimetre.

The Talcher Fertilizer Project is one of the three coal-based Fertilizer Projects being constructed by the Fertilizer Corporation of India. The project with an estimated cost of Rs 1660 million will have a capacity to produce 495,000 tonnes of Urea per year and is likely to go on stream towards the end of this year.

Garments Spin Foreign Exchange

The ready-made garment Industry in India has emerged as a good foreign exchange earner during the last five years and garments worth Rs 250 crore were exported during 1975-76 against a mere Rs 18 crore in 1971-72. The export target of such garments was likely to reach a figure of Rs 1,000 crore by 1980. While cotton garments, including handloom, crepe, mill-made and silk garments had gained prominence, the garments from man-made fibres and woollen had shown a declining trend.

Out of the total export figure of Rs 250 crore, the export of handloom garments alo amounted to Rs 180 cror United States was the bigge market for our garments, fc lowed by the Soviet Unio Sweden, the United Kin dom, France, West German Australia, Japan, Canada ai the Netherlands. The Unit States and European Econ mic countries (EEC) account for 85 per cent of exports. The is a big untapped internation market for industrial clothi and military uniforms besid a wide scope for childre wear. Prospects for expo of winter garments, especial for polyester blended garmen are promising.

Big Rise in Foreign Exchange Reserve

India's foreign exchange reserves (excluding gold and SDRs) have shot up by more than 400 per cent, in the last 18 months to a record level of Rs 2,484 crore. They have now skyrocketed despite the repayment of Rs 296 crore to the International Monetary Fund in 1976. In the first 10 months of the current financi year, the reserves improved b Rs 913 crore over and abov the IMF repayment. In the co responding period of 1975-76 the improvement was muc more modest at Rs 311 cror which was mainly due to a bo rrowing of 200 million SDR from the oil facility of the IMF.

UN University Centre at CFTRI

The Central Food Technological Research Institute, Mysore, has been selected by the newly formed United Nations University established in Tokyo, Japan to train scholars from developing countries in the advanced techniques of post-harvest conservation and processing of foodgrains.

The CFTRI is the only institution selected by the UN University to provide advanced training and to identify specific research prior ties under World Hunge Programme.

The CFTRI will functio as an Associated Institutio of the University and wi provide both multi-disciplinar and applied training in pract cal areas of post-harvest foo conservation at appropriat levels through improved hand ling, storage and processin techniques.

New Technology For Rainfed Farming

The Punjab Agricultural University has developed a technology for ensuring good yields of wheat and maize crops in rainfed areas of the Punjab. Soil scientists working on a project at Garhshankar in Hoshiarpur district have found that wheat yields can be increased by as much as 150 per cent and maize yields by 60 per cent even in unirrigated areas. The techniques are efficient moisture conservation, proper fertilizer use and wise selection of crops and varieties suited to different soils.

It is not generally realised that Punjab has substantial unirrigated area. In fact about 70 per cent area in the districts of Gurdaspur, Hoshiarpur and Rupnagar in Punjab is rainfed making the crop yields as uncertain as the rainfall.

To ensure moisture conservation efforts should be made to help the soil to absorb every drop of rain water. Stirring the field with a plough and spreading available mulch (shrubs and leaves) help in absorbing the moisture, minimizing in the process the losses of both water and fertile soil. But it is generally not possible to retain the entire rain water on the field that receive it because the rainy season usually consists of a few storms whose intensity makes it im possible to retain the entire rain water on the field that receives it. This run off water should be collected in natural depressions or artificial ponds

PRICES AND HIGH PRICE[S]

Even as the Goverment and the people who elected i[t] are settling down after a brief and understandabl[e] spell of euphoria, the economic horizon is cloude[d] by the disturbing situation of rising prices of essentia[l] goods. Lentils, edible oils, pulses, tea and various othe[r] articles of daily consumption including vegetables ar[e] marked with high prices. The price of cement has gon[e] up by over 50 per cent and traders are reported to b[e] hoarding stocks. House rents have shot up all over th[e] country and only those who have no place to stay kno[w] how difficult it is to get a two-room flat in metropolita[n] cities. The most hard-hit are officials on transfer. Becaus[e] of the rising cost of construction and various othe[r] constraints on private housing, additional housin[g] accommodation is not being created to meet even [a] part of the growing demand.

This situation is not a post election phenomenon. Th[e] trend has been in evidence for over a year in regar[d] to commodities of daily consumption though the housin[g] problem was very much there in all its present seriou[s]ness even during the emergency, The differnce is tha[t] things are being reported now with greater freedo[m] and objectivity. Most of the retail merchants hav[e] consigned the pricetags to the waste-paper basket an[d] show a brazen 'take-it or leave it' altitude to th[e] customer. The danger is that price inflation, if allowe[d] to take its own cruel course, will upset plan expecta[tions], and pull back the pace of development.

It is gratifying that the new Government has reco[g]nised the seriousness of the problem in good tim[e]. The new levy of Rs. 5 per kg. on tea and the with[drawl] of its rebate scheme on its exports should hel[p] ease the domestic demand for this assential commodit[y]. What remains to be seen, however, is the response o[f] the trading community to the appeal made by the Unio[n] Minister of Commerce, Civil Supplies and Co-operatio[n] that they should act as trustees of public weal an[d] refrain from their gluttony for high profits. As thes[e] lines go into print, the Union Cabinet will discuss i[n] depth the price situation and devise measures to keep i[t] under check. In an effort to maintain a high level o[f] cement production of essential commodities the Unio[n] Government has already asked State Governments to re[]store power cuts in favour of industries engaged in manu[]facture of essential items like cement and Vanaspati.

It is equally important that the workers and manage[]ment should lend their shoulder to the common effo[rt] by withholding strikes and lock-outs, The new atmos[]phere of freedom should help and not hampar the proces[s] of production. Without optimum production no publi[c] distribution system can work smoothly and maximum suffering comes to the poorest of the poor. His sugges[]tion that informal committes with representatives fro[m] among management and workers should thrash ou[t] problems across the table has been given in the tru[e] sprit of democracy which was examplified in the rece[nt] poll. In a democracy restraints have to be voluntar[y] and self-imposed and there can be no truer vindicatio[n] of the people's will than for the workers and manageme[nt] to feel involved genuinely in the nation's welfare. Indi[a] is passing rhough a crucial stage in its history of deve[]lopment and the economics of democracy cannot b[e] divorced from the politics of it. The nation keenly look[s] forward to firm and imaginative handing of the situatio[n] by the Union Government.

COCONUT—*The Tree of Wealth*

NO OTHER CROP plant in the Tropics has so much to offer as the coconut palm. With its unbranched pillar-like steam and the massive and elegant crown of giant, featherlike leaves, it is a majestic and beautiful palm. The coconut palm grows as high as 25 meters and lives to a century. The solid trunk is 30-45 cm in diameter and is marked by ring-like leaf scars.

The utility of the coconut to the economy of the region where it grows cannot be over emphasized. In our country it has been extelled as the Kalpa Vriksha or the all giving tree'. The classical literature of India has glorified it as among the five *Deva Vrikshas* or Godly trees, providing a variety of products useful to the daily life. Legends have grown around its origin and there is the mythological story of the milky ocean which, on being churned, produced a froth from which five holy plants sprouted one of which was the coconut palm. The Indonesians say that the uses of coconut palm are as many as the number of days in a year. No epithet would suffice to convey the wide utility of this tree whose every part finds some use or other in our daily lives

In terms of geographical distribution, the coconut ranks first among the oil yielding crops of the world, followed by groundnut, cotton, sesame and oil palm, in that order. Grown in as many as 76 countries, half the total world production of nuts supports a great bulk of humanity for their livelihood. Oil, oil cake, coir and charcoal are the major products. Each one of these is put to further use in a wide range of manufactured products, for human or animal consumption and for making industrial products.

Mr Kunhikrishnan is Jr. Scientific Officer, C.P.C.R. Kasaragod

Kerala—The Land of Coconut

In India Kerala (*Kera* meaning coconut and *alam* meaning land) has the maximum concentration of the coconut palms. Majority of people in this thickly populated state depend on coconut either directly or indirectly for their livelihood.

Besides Kerala, Tamil Nadu, Karnataka, Andhra Pradesh, West Bengal, Orissa, Maharashtra, Gujarat, Goa, Lakshadweep and Andaman Islands also produce coconuts in substantial quantities. Cultivated over an area of 1.1 million hectares, India produces

Peeling the coconut in a coconut farm in the Laccadives

K. KUNHIKRISHNAN

nearly 6,000 million nuts annually (Table). The area was 0.5 million hectares in 1920 and 0.6 million hectares about two decades ago. The industry now provides employment to over 10 million people. Coconut accounts for one percent of the country's GNP and two per cent of the total agricultural income.

Coconut in Our Daily Life

Coconut has always been an object of reverence in local tradition in India. It has a recorded history of over 3,000 years in our country. For all religious Hindu rites right from birth to death coconut or parts of it is a must.

"Narial Poornima" is a pompous celebration in the Konkan areas of Maharashtra where coconut is offered to the sea in worship on that day. Launching of a newly built ship or vessel in any part of the country from the large shipyards to country boatmaking units is marked by the ceremonial breaking of a coconut In all auspicious occasions, the *Kalasam* or "*Kumbham*" containing water for consecration in a vessel is topped by a coconut placed on mango leaves, and the "*Thamboolam*" given to the elders by the bride's party has a coconut. It is common to see devotees go to the temple with a coconut, betel leaves, arecanut and flowers to offer worship. In "Vettakkaran Pattu" a special offering in Vettakkarumakan temples of Kerala, coconut finds a prominent place Twelve thousand coconuts are broken in a few hours' time in worship to the jungle god born to Siva and Parvati. In the famous Ayyappan temple, it is the practice of every pilgrim to offer a minimum of five coconuts. The Orthodox Church in Kerala celebrates Palm Sunday with blessed tender coconut leaves to commemorate the triumphant and glorious entry of Jesus Christ into Jerusalem. The blessed palm leaves are taken home with reverence and kept at a venerable

Tapioca is a staple food of Kerala and this tuber is ideally suited for cultivation as an inter-crop in coconut plantations.

TABLE 1

Distribution of Coconut in India

States	Area ('000 hectares)	Percentage share	Production (Million) nuts)	Percentage share
1. Kerala	748.2	67.1	3718.7	62.4
2. Tamil Nadu	112.3	10.1	986.6	16.6
3. Karnataka	140.5	12.6	759.8	12.7

(*Source*: The coconut Profile of India; Pub: Directorate of Coconut Development, Cochin-682011)

place as a source of blessing.

Despite several theories put forward on the origin of coconut we are still not sure where it first came from. The wide dispersal of the crop, its antiquity in the tropical countries where it is grown and the want of convincing evidence in support of its origin in any particular region render most of the theories incredible. The weight of evidence, however is in favour of its origin somewhere in south-east Asia.

A small holder's crop and its Problems

The average yield in India is 5344 coconuts per hectare. The highest yield is in Karnataka where it is 8785. Next comes Tamil Nadu with 5408 average nuts per hectare. In Kerala the average yield is as low as 4970. There are about 5 million coconut holdings in the country. Of these 98 per cent are only less than two hectares in extent (Table 2).

Though coconut has a profound influence on the agricultural economy of Kerala only 66% of the palms are in bearing stage. Because of the pressure on land with increasing population the palms planted at close intervals in homesteads compete for existence. At the recommended spacing one hectare of land can support only 175 palms, whereas in Kerala there are 225 on an average. The ravage of pests and diseases also takes a heavy toll of the crop in Kerala.

Although control schedules are available for all the pests and some of the diseases, maladies like the root (wilt) disease prevalent in south India continue to baffle the scientists. This disease which appeared in 1882 after the great floods is prevalent in about 2.5 lakh hectares and causes an annual loss of Rs 300 million to the national exchequer. Concerted efforts are in progress at the Central Plantation Crops Research Institute, Regional Station, Kayangulam in Kerala, to find a lasting solution to this national problem. Localised problems like the Tanjore wilt of Tamil Nadu, Thatipaka disease of Andhra Pradesh and stem bleeding are other maladies plaguing the coconut palm. Such diseases of uncertain aetiology are not peculiar to India alone. Other countries also have such problems. Cadang Cadang (meaning dying dying) of the Philippines, lethal yellowing of Jamaica, Tinangaja of Guam, leaf scorch decline of Sri Lanka, and Cape St. Paul wilt and Kaincope disease of West Africa are some among them.

A Reliable Source of Income

Coconut is a tree that gives continuous yields once it starts bearing after 6-8 years of planting. After every 30-40 days, the grower can harvest a bunch. Heavy bearing trees are usual sights in the backyards of houses evidently due to the favourable conditions. The farmer is assured of 80-100 nuts per tree in a year worth about Rs 100. With 5 to 10 trees in the homesteads, the purchasing power of the family is considerably enhanced. In large scale cultivation the crop gives an annual income of about Rs 5000/- per hec. under rainfed conditions. An interesting feature of this crop is that it can accommodate a variety of other crops along with it. However, to the detriment of coconut crop this has been made use of by farmers resulting in an unscientific approach to cultivation.

Hybrid coconut palm evolved from Laccadives and Ganga Bondam.

Intensive cropping systems with other perennial and annual crops is a highly paying proposition. Of the many crop combinations, one termed as "multi-tiered cropping", coconut + pepper + cocoa + pineapple gives a net return of nearly Rs 17,000 per hectare annually under conditions of ideal management. While such crop combinations require additional inputs, they offer several advantages like additional employment for the otherwise wanted surplus labour, generate organic wastes that could be recycled and improve soil health and fertility. With almost the same quantity of water these additional crops can be maintained. Coconut growing areas are characterised by a high density of population and thus the crop is a boon to the small farmer. Research conducted so far shows that the coconut is ideally suited for a balanced plant-animal-human eco-system in which perfect harmony between these three life patterns can be achieved to their mutual advantage.

Copra being peeled at a Government farm in middle Andamans.

Coconut Oil

The most important commercial product of coconut is its oil. Oil

An interesting freak coconut palm with four branches found in Car Nicobar

is obtained from the dried kernel, called copra. Four-fifths of the copra produced in India is used for milling and the remaining is considered directly. Coconuts are dehusked and broken into halves, the water drained off and the split halves dried in the sun or in kilns. The content of copra varies between different varieties, seasons of harvest and maturity of the nut However the average oil content works out to a little over 60 per cent. Modern extraction methods employ hydraulic presses, expellers and solvent extraction procedures. The price of coconut oil is related to the prevailing prices of other edible oils like groundnut, gingelly, mustard etc. These being annual crops, their area as well as production fluctuate unlike in the case of coconut. As it happened in 1975 which was a bumper crop year, it was the coconut that suffered because of the surplus oil from these crops. For a coconut farmer, this will adversely affect the economy because of the peculiar nature of the crop There is a case therefore for a minimum floor price for coconut.

Three-fourths of the oil produced in our country is reported to be used as cooking medium. Only the remainder is consumed by the industry in the manufacture of soaps, toiletries and, to a small extent, in the manufacture of Vanaspati. The left over oil cake is an important cattle feed.

Tendernuts and Toddy

Tender coconut is a popular drink wherever the palm grows. It is said that as many as 51 million tender nuts were sold in 1951 in

TABLE 2

Size of coconut holdings in India

Area of holding (in hectares)	Percentage of holdings of different sizes			
	Kerala	Tamil Nadu	Karnataka	Andhra Pradesh
Less than 0 2	37.1	69.1	52.5	56.5
0.2—1.0	52.8	26.0	42.9	41.7
1.0—2.0	7.9	3.2	3.6	1.8
2.0 and above	2.2	1.7	1.0	—

(*Source* · Coconut Profile of India)

Bombay alone ! Almost the entire production of coconut in West Bengal is consumed as tender nuts, mostly in Calcutta. Tender nut is valued both for its sweet water, a most refreshing drink, as well as the gelatinous kernel, which is a delicacy with food value. Sugars, salts and amino acids are important constituents of nut water. It is used as a nutrient medium for microbes and plant tissue and cell culture and also administered as an intravenous infusion. It is strongly advised in cases of severe gastro-enteritis to correct the fluid balance. It also has aparient and diuretic properties.

Young inflorescences when cut, termed 'tapping' give a sweet sop called *Neera* which is a refreshing beverage. On fermentation it becomes toddy, an alcoholic drink On an average, a palm yields 1·5 litres of sweet toddy everyday Sweet toddy is refrigerant and the main component is soucross It also contains ascorbic acid. Toddy industry is an important source of revenue for Kerala, Goa and Karnataka. It adds about Rs. 150 million annually to the revenue of Kerala and provides employment to over 50,000 persons through the nearly 3,000 toddy shops. Fresh fermented toddy is also useful as a source of yeast in bread making.

The Golden Fibre-Coir

India accounts for half the total world production of coir. This golden fibre earned India foreign exchange worth Rs. 180 million last year. We hold a virtual monopoly in the production of spun yarn which is the starting material for the manufacture of floor coverings and coir ropes. The Indian coir industry produces

Exposed kernels of dwarf orange and dwarf and tall variety hybrid.

A palm fringed beach in one of the Nicobar island.

a wide variety of attractive products like mats, carpets, yarn etc Because of the abundance of natural retting facilities, Kerala alone accounts for more than 90% of the total production of coir in the country, with Tamil Nadu and Karnataka making up the rest.

Coir mats and mattings are produced on handlooms in our country and the industry is over a century old In contrast, the European production of mats and mattings is mechanised and power looms capable of producing high quality sophisticated coir products are in operation. Fully mechanised western industry is posing a serious threat to the handlooms in India. It is primarily the European coir industry that has, by effective marketing, kept coir mats and mattings on the shopping list of modern housewives. We have started manufacturing rubberised coir but this sector now caters only to the indigenous market. Concerted efforts and research work is in progress at the Central Coir Research and Training Institute of the Coir Board at Alleppey, on all aspects of coir.

Research and Development

Though coconut was said to be in existence from time immemorial, systematic research on the crop was started only in 1916 in India. The area under coconut was at that time the maximum in the Madras Presidency of those days With a view to studying the requirements of the crop under different soil types, research farms were established in 1916* at Kasaragod and Nileshwar (Cannanore district, Kerala) and scientific investigations commenced. Fundamental studies were initiated in the early 20's to obtain informatio on the genetical and manageme aspects of the crop. With a view t improving the genetic stock, exot varieties were introduced from diffe ent coconut growing countrie At present the varietal collection a Kasaragod comprises 64 exoti from 26 countries and 32 indigeno varieties, the largest collection c coconut varieties in the world.

The first coconut hybrid wa produced in the 30's by crossing loca West Coast Tall with Chowgha

Turmeric (above) and Cocoa (below) being grown as an inter-crop in a coconut garden in Kerala.

*The CPCRI, Kasaragod, celebrated the Diamond Jubilee of Coconut Research in the country from Decembe 27, 1976 to January 8, 1977. An International Symposium was also organised as part of the celebrations.

Composition of coir exports from India

Quantity in quintals, Value in lakhs of rupees

Dwarf Green. In the early forties further progress was achieved on the breeding aspects of the crop. Investigations were also initiated on the crops that could be grown in the interspaces of coconuts as well as on cover crops in the garden The superiority of the hybrids to its parents has been well recognised and in order to meet the increasing demand from coconut growers large scale production programmes are being implemented in the states of Kerala, Karnataka, and Tamil Nadu The root (wilt) disease has been a major disease of the crop since 1880 In order to tackle the disease problem as well as other diseases and pests a Research Station was set up at Kayangulam in 1947 For investigating the local problems a few other research centres were started in the important coconut growing regions of the country in the 1950s

During 1970 the Indian Council of Agricultural Research reorganised the research set up on plantation crops, including coconut, and the Central Plantation Crops Research Institute (CPCRI) was set up with the headquarters at Kasaragod The Nileshwar centres are now with Kerala Agricultural University and the Kerala State Department of Agriculture. These centres are still leading centres of coconut research in the world An All India Coordinated Crop Improvement Project, started functioning in 1971

The CPCRI has now five Regional Stations, seven Research Centres and Two Seed Farms spread in different parts of the country. It has 71 scientists working on 46 major research projects on coconut in all the different specialised branches of agricultural science Besides, 55 scientists are working on 48 experiments at 13 co-ordinating centres located in eight states.

Altogether, there are 23 centres in our country where scientific research is being done on coconut The average annual expenditure on research is approximately Rs 7 5 million

The National Commission on Agriculture has projected that by 2000 A D our requirement of coconut would be 13,585 million nuts If the available technology is effectively transferred to farmers fields, we could even be a major exporter of coconut to the international market. □

Tea industry occupies an important position in our national economy. It provides employment to 8,50,000 workers and contributes 1.25 per cent to the GNP. Tea exports account for about 7 per cent of the country's export trade. With an annual crop of 500 million kilogrammes we produce more than what the rest of the world produces. Our yield per hectare (1360 kgms) is also the highest in the world. Yet the industry suffers from severe drawbacks.

Tea Industry—

MORE INCENTIVES NEEDED

P. V. KRISHNA RAO

IN INDIA TEA is grown in Assam, Cachar, Darjeeling, Dooar, Terai, Tripura, the Nilgiris, the Annamalais, High Ranges (at Munnar) Wynaad and Kerala The production of tea increased from 431 million kg in 1971-72 to 510 million kg. in 1975-76 an increase of 18.3 per cent in four years, while the exports show only 1.4 per cent increase during the same period This may be attributed to increase in the domestic market

India exports tea to more than twelve countries. Indian tea has come to be recognised as an important commodity in foreign markets Sizeable quantities have been sent to UK, USSR, Netherlands, Iran, U A R. and other countries Britain has been the largest importer and consumer of tea and India has been the major supplier In 1975 India exported 81 million kg. to UK which accounted for 37.1 per cent of the tea imports of UK, as compared to 108 million kg in 1950 which accounted for 65 per cent of the total tea imports of U K But East African countries recorded a very sharp increase during this period, the increase being from 2.8 per cent to 29 per cent. In absolute terms the increase was from 4 million kg to 63 4 million kg

The total value of exports of tea has risen from Rs 1550 million to 2360 million during the period of four years. This indicates an increase of Rs 810 million during four years India's tea export trend has been further analysed in terms of value Export earnings from all commodities have increased by 145.2 per cent from 1971-72 to 1975-76, while earnings from tea exports show an increase of 52 26 per cent during the same period. It is interesting to note here the rate of increase of tea export earnings is much less than the rate of increase of the total earnings. The reason may be attributed to the lower rate of increase in exports of tea as compared to exports of other commodities like sugar The share of tea in percentage to total export earnings has also decreased from 9 6 to 6 per cent during the same period

There is no significant improvement in production or in export performance Exports have stagnated at 200 million kg a year The share of India in the total world exports has also fallen from 45 to 29 per cent between 1951 and 1975 The country would need 1,500 million kg of tea to meet its domestic demand alone in 25 years. Therefore, the need is to increase production and productivity and also find ways and means of improving export performance

The major problem of the industry relates to the replantation of overaged bushes It is estimated that almost a third of tea plants in North-Eastern India is more than 50 years old The proportion in Southern India is even higher, the total for the whole country works out to about 1,30.000 hectares out of a total area of nearly 360,000 hectares Higher levels of productivity can be achieved with systematic replantation and careful tending of over aged bushes. But replantation schemes are not being implemented vigorously as it might result in a loss of income for some years. The Tea Board has a replantation subsidy scheme in operation since October, 1968 which provides Rs 5,000 and 4,000 per hectare for gardens in hilly regions and plains respectively. The industry feels that these rates are very low. Its own estimates of the subsidies needed for steady replantation are Rs 30,000 and 22,000 per hectare respectively In addition to the replanation subsidy a pool can be created by which the small growers can be benefited for the loss of income that would arise out of replantation on the understanding that a portion of additional income accrueing in later years will have to be repaid to the pool against payments received in earlier years. Some allowance should also be given to the industry in respect of depreciation in value of fixed assets as in the case of rubber in order to generate the required resources for replantation. Production can also be increased by propagating high yielding varieties, by planting new bushes between two lines of tea plants and by extending the area under the crop. It has been reported that the availability of additional land for growing tea may not be more than 50,000 hectares.

Sick Gardens

A task force set up by the central commerce ministry found that sickness is generally confined to that sector of the industry which is controlled by individuals or partnerships Managements of such gardens, with some exceptions have been deficient in their knowledge and capability of sound management. Government can take over the managements and restore the gardens through the Indian Tea Industries Development Corporation. But the Government can utilise is expertise either by way of a contract or by making it subsidiary to any Government Agency like Tea Trading Corporation of India or proposed Tea Corporation of West Bengal. Sick gardens in Assam can certainly be expected to be looked after by the Assam Tea Corporation which has been doing

---

Shri Rao is Lecturer, Dept. of Commerce, Nagarjuna University, Guntur

extremely well since its inception Other State Level Corporations may be set up for taking over sick gardens in their respective areas. A new Corporation can easily be set up to work in close colloboration with Tea Board.

Yet another problem of the industry is lack of adequate finances for modernisation. Of the institutions now providing term finance to tea industry, Tea Board is perhaps the most important administering two financial schemes, the tea plantation finance scheme with a fund of Rs. 45 million and the Machinery and Irrigation Equipment Hire Purchase Scheme with a fund of Rs 90 million The scale of assistance under the first scheme is however meagre. Rs. 11,250 per hectare in plains and Rs 12,750 for those in the hills It is suggested that should be raised to Rs 20,000 and 22,000 respectively. Loans provided under the second scheme cover fully the initial cost of machinery and equipment and the loan is repayable in ten or less instalments. But the maximum value of machinery and/or equipment that may be purchased by one tea estate or factory is not to exceed Rs. 6 lakhs. The industry feels that the existing ceiling is low and so it is suggested that the ceiling should increase from Rs 6 lakhs to Rs 10 lakhs An indirect source of finance for the tea industry is the Agricultural Refinance Corporation, but the quantum of assistance availed of from the Corporation is not large There is a good case for greater finance from out side, than the Tea Board has been giving so far The facilities of all-India financial institutions such as IDBI and IFCI should be extended to this industry. The funds of the World Bank and International Development Association (IDA) can also be made available to this industry

Regarding short-term finance, industry complains that some banks are not following the recommendations of the Reserve Bank of India. So, the RBI should look into the matter and see that banks implement its directives

Lastly due to heavy taxation and labour costs rising faster than the prices and productivity many estates have not been able to take up development and maintenance work The Government should reduce excise duty rate to the level of 10 paise per kg which is charged on green tea

Certain incentives can also be given such as rebate of full excise duty on exported tea This would not only ensure the present level of the tea exports in quantity but would also give encouragement to exporters to put in more tea for export and also push up sales in those countries where consumption is low The industry also must show initiative and enthusiasm in promoting exports to traditional and new markets Greater attention will have to be paid to sophisticated and aggressive mass promotion compaigns The International Tea Promotion Associations composed of the World's major tea producing and exporting countries is to be formed shortly with promoting tea consumption as the main objective This may help in boosting tea exports to countries where consumption is low and enable the tea industry to grow at a faster pace □

THE GREEN GOLD

S. K. SHUKLA

THE SANDAL WOOD is one of the oldest known items of perfumery and finds a place in records as far back as 400 B.C. From the Vedic times the tree has been revered, respected and protected. The wood has been associated with Indian culture and civilization through its various usages in all religious functions. It is classed as 'royal' tree in Karnataka State and the Government has the right to extract the tree even when found on private land. The land-owner is, however, granted bonus depending on the sale price of the tree.

The genus *Santalum* is endemic to the Southern Hemisphere except *Santalum album* which is fairly well distributed in the northern part of Southern India It is believed to have been introduced from Indonesia in the remote past According to another view, Sandal is indigenous to India The wood finds a pleasant mention in Indian mythology, folklore and scriptures 'Kautilya' described a variety of Sandalwood in his 'Arthasastra' (200 B C) Also it finds a mention both in 'Ramayan' and 'Mahabharat' There is sufficient evidence that this species has been in India for the past about 25 centuries

It will be of interest to know that it is a root hemi-parasita and possesses a wide range of nearly 300 host species, with which sandal forms root attachments (haustoria). Like human beings it differentiates between 'good hosts' and 'bad hosts' The health of the tree (like human beings) depends on the hospitality of the host. It obtains its requirement of lime and potash directly from the soil while for nitrogen and phosphorous it partially depends upon its host

It flourishes best in Karnataka and Tamilnadu in the upland pleataus between 650 to 1150 m. and rainfall between 60 to 115 cms. under conditions of drainage Though it grows at its best on rich, fairly moist and fertile soils, it frequently occurs on rocky ground where trees occur mainly in open scrub forests In such locations, the tree does not attain large dimensions but possesses more highly scented wood It grows well under shade unless it is too dense. It is a small to medium sized evergreen tree with slender branches sometimes reaching to a height of 18 m. and 2·5 m. girth It has been growing in M.P. and also in Bundelkhand region. Introduction in Rajasthan, Orissa, Gujarat and in the 'Tarai' and foothills of the Himalayas in UP have shown good growth but poor heartwood formation In Dehra Dun forests too it grows as if it was natural to the region but the oil content is very low and growth is very slow It has been successfully introduced in Kerala and grows apparently in wild form both on the hills and in the low country. In Andhra Pradesh it has established in Cuddapah, Hyderabad and Kurnool districts and also in Chittoor and in Anantapur.

It has become naturalized in Chittorgarh, Banswara and Jhalawar districts of Rajasthan mostly on the trap formations It is an important species recommended for dry-zone afforestation Natural reproduction of the tree from the introduced plants in Ajmer has been reported. The tree has been introduced in the areas served by Ganga Sagar dam in Gujarat and in Mandsur and Ratlam districts of M.P. It is growing on Parasnath hills in Bihar and in West Bengal where some of the trees have developed fair-sized scented heartwood. The tree has picked up well in Assam as well.

Contrary to the general belief the genus *Santalum* grows in parts of Malaysia, Australia, Newzealand, Polynesia and extends up to Hawaiian Archipelago Of all the species, the *Santalum album* growing in India is the most important In market it is known as East Indian Sandal wood and the oil is also named after it. Both wood and oil are priced for their use in perfumery and for medicinal use The wood is one of the finest for carving and is employed for making curios of exequisite beauty coupled with the sweet smell they carry No Hindu worship appears to be complete till sandalwood paste is applied on the deity as well as on the forehead of the man worshipping the deity Scented sticks (agarbattis) always carry the fragrance with them in houses, functions and practically in all places of worship

Most of the sandalwood is obtained from the natural forests and some quantities from plantations and those growing in agricultural fields and village lands Large scale plantations have been tried in Karnataka and Tamilnadu but because of insufficient understanding of the host-parasite relationship, lack of

Final dressing, Sapwood being removed from billets and rootpieces Shavings being collected on gunny cloth and sapwood chips seen in the rear.

protection from animal grazing, man, drought, fire, excessive weeds, unfavourable climatic conditions the devastating sandal-spike disease, the mortality has often been high and more than 10 to 15 trees per acre are not found Mixed forests are preferable. It does well in Eucalyptus plantations, because of the congenial host and at the same time because of less chances of spike infection

It reproduces plentifully from seeds dispersed by birds and to some extent from root suckers Germination is profuse immeidately after the monsoon It is important for natural regeneration that suitable hosts like *Acacias*, *Albizzia lebbek*, *Azadirachta Indica*, *ziziphus* spp *Bamboo* spp. *Bassia* spp *Casias*, *Dalbergia* sissoo. *Eucalyptus* app *Gossypium arboreum*, *Grevillia robusta*, *Tectona grandis*, *Terminalia*, spp. etc. be maintained It finds a very good host in the abominable Lantana Camara but it is better to avoid it as it is suspected to be connected with the transmission of spike disease and giving abode to the disease carrying insects. In favourable site, at the end of about fifteen years, when incipient heartwood appears, the saplings attain a height of 10 m. Growth of the tree under natural forest conditions shows considerable variations reflecting environmental influences

This valuable tree is most susceptible to spike disease which often forms a virulent epidemic status in major sandal forests in South India, greatly reducing the yield of heartwood. In the diseased plants the leaves diminish in size, become stiff and spike like acquiring a reddish or yellow tinge and the shortened internodes give the characteristic 'witches' broom. The disease manifests itself in about seven months, resulting in death in about two to three years, depending on the girth The disease was first discovered at the close of the nineteenth century in Coorg The disease has been noticed only in India and was earlier suspected to be due to virus but later studies reveal the mycoplasmal etiology. Lot of work has been done to control this disease, without success. Forest Research Institute, Dehra Dun is busy studying the spike pathogen, the mode of its multiplication, pathogen-pathogen plant hosts-insect vector-vector plant hosts relationship, insect vector biology and ecology for finding out a much sought after control measure. It has been suggested efforts be made to change the genetic constitution of the tree so that a better tree was evolved which would be disease resistant and richer in oil content Experiments on these lines are in progress at the Forest Research Institute, Dehra Dun and tetraploid saplings have been successfully produced which are growing well The assessment of success can be had only after the heart-wood formation

The harvesting is very interesting, as unlike other trees it is not cut, but uprooted (as oil content in roots is the highest). The various pieces are reassembled on the ground to form a replica of the original tree the individual pieces are serially numbered and described with a rough sketch of the tree as a whole, to ensure that no piece is illicitly removed and reaches the depot safely The sawdust of this costly timber is also carefully preserved and has a good market. Heartwood containing world renowned essential oil is used mainly for distillation, the remaining wood being used for carving and incense making etc The darker the wood the higher the oil content. The oil content of the heartwood fluctuates with locality and age of the tree and the average ranges between 4.50 and 6.25 per cent. The roots may yield oil upto 10 per cent. The admixture of heartwood and sapwood has about 1.5 to 2·5 per cent. The oil content of heartwood grown in regions other than Karnataka and Tamilnadu is about 2 per cent. Karnataka alone gives an average of about 2000 tonnes of wood per annum which comes to about 60 per cent of the world trade in this valuable wood. The annual production of sandal wood oil in India is around 100 tonnes priced at about Rs. 650 per kg This is a foreign exchange earner since 1918.

The oil is widely used in perfumery, soaps, fac creams, toilet powders and other cosmetics. During the early part of 20th century, a large proportion of oil was used for medicinal purpose, but now the requirement is not more than 10 per cent. Both the wood and the oil are credited with cooling, diaphoratic, diuretic and expectorant properties.

There are three types of sandalwoods in the trade viz (1) East Indian Sandalwood, (2) Sandalwood of the Pacific group and (3) Australian Sandalwood The price of heartwood ranges from Rs 30,000 to Rs 40,000 per tonnes and that of the sapwood about Rs 300 per tonne. Sandal woodchips, dust, carvings and oil are exported from India to Japan, Hongkong, Nigeria, Singapur, U S A., Saudi Arabia, Ceylon, Europe, U S.S R, Sudan, Malaysia etc. and are a very good sources of earning foreign exchange

Sandal trees are really green gold and unlike minerals with little bit of care it can be an inexhaustible source of revenue India has the monopoly in exporting East Indian Sandalwood oil. Because of the disease, pilferage and smuggling, the productin of sandalwood is on the decline. It is, therefore, necessary that more trees be grown in forests, plantations, vacant village lands, urban areas etc so as to boost the supply of this valuable foreign exchange earnings specie □

SUGAR—

A Valuable Foreign Exchange Earner

Sugar ranks second among the major agro-based industries in the country. It is a valuable foregin exchange earner. During 1975-76 it earned about Rs. 464 crore in foreign exchange for the country. It provides direct employment to 3 lakh workers. A large number of farmers are also engaged in the production of sugarcane.

B. A. IQBAL & SALA HUDDIN

SUGAR IS AN agro-based industry. It ranks second among the major agro-industries in the country Located in rural areas sugar industry has provided the most effective instrument for carrying progressive trends into the countryside As sugar is an essential food item, used by almost all peoples of the world, its contribution to country's economy is also of paramount significance

The sugar industry provides direct employment to about 3 lakh workers. About 25 million agriculturists are also connected with it. It earns about Rs 4640 million in foreign exchange Besides the industry supports a number of ancillary industries in the country and contributes Rs 3000 million to the central and state exchequers The capital employed in this industry i of the order of about Rs 7500 million crores and its products are valued over Rs 10,000 million Indian sugar accounts for about 12 per cent of the country's export trade.

The chief sugar producing states in the country are Maharashtra, Uttar Pradesh, Andhra Pradesh and Tamil Nadu. These states account for nearly 79 per cent of the total production. Sugar is also produced to a smaller extent by other states like, Bihar, Gujarat, Haryana and Punjab. The state-wise production of sugar is given in table 1

The production of sugar during 1974-75 was 47 lakh tonnes as compared to 39 lakh tonnes in 1973-74 The entire increase in output (21 per cent) was brought about by the rise in output in Maharashtra and Uttar Pradesh, which account for 62 percent of the total sugar produced in the country. In the last twentyfive years the production of sugar has increased from 1,118 thousand metric tonnes in 1950-51 to 4,794 thousand metric tonnes in 1974-75 i.e. an increase of 328 per cent. Domestic consumption during the same period has increased from 3 kg to 7 kg i.e. 250 per cent. These figures highlight the fact that the rate of increase in sugar production is higher than the rate of increase in consumption. Sugar export commenced in India in 1956-57. Since then our exports have increased quite a lot. However in recent years some returns had to be guaranteed to the Indian exporters because of the low prices ruling in the world market. In any event sugar has come to occupy an important place among our major foreign exchange earners.

TABLE 1

Production of Sugar in India in 1974-75
(000 Metric Tonnes)

Name of State	Production	Percent to total product
Maharashtra	1515	31.56
Uttar Pradesh	1413	29.81
Andhra Pradesh	397	8 27
Bihar	212	4 41
Karnataka	336	7.83
Tamil Nadu	384	8 62
Others	537	9.50
Total	4797	100 00

Source: The Economic Times, Bombay, September 21, 1976. and Indian Sugar, New Delhi June 1976

Over the last few years the demand for sugar in the international market had outstripped supply owing mainly to crop failure in Cuba as a result of which the world price of sugar tended to soar very high. This helped no end in pushing up the exports of Indian sugar in 1974-75. However, during 1975-76 the price of sugar fell steeply in unit value in international market from Rs 4,509 per ton in 1974-75 to Rs 3135 per ton during 1975-76. The decrease in price was, however, made good by doubling the quantity of sugar exported, Our exports touched 12.01 lakh tons in 1975-76, as compared to 6.94 lakh tons during 1974-75. The total export earning from sugar increased to Rs 4640 million including a rupee profit of about 1700 million by the Government i e. an increase of 25·4 per cent, from Rs 3390 million in 1974-75. Such large exports were possible because of the sharp increase in sugar output during the year 1974-75 season, when it reached an all time record figure of 4·79 million tonnes. The industry could indeed be proud of this achievement. Unlike many other commodities the increase in foreign exchange from sugar exports was due mainly to the increase in the quantum of exports. The following table indicates the year wise position of sugar exports fron 1958-59 to 1975-76.

TABLE 2

Sugar Exports Between 1958-59 to 1975-76

Year	Quantity Exported (Lakh tons)	Value Earned (Crores)
1958-59	.54	2.54
1959-60	39	1 66
1960-61	2 47	3 28
1961-62	3.29	15.34
1962-63	5.26	18.03
1963-64	2 69	27.26
1964-65	2.70	18.21
1965-66	3 92	11.83
1966-67	1.85	17 75
1967-68	1.25	16.44
1968-69	0.84	10.46
1969-70	2 17	15.80
1970-71	3.25	30.20
1971-72	1 00	31.03
1972-73	.97	13 30
1973-74	2.52	42.69
1974-75	6.94	339 01
1975-76	12.01	464 00

In terms of value, while export earning from all commodities increased by 591.58 per cent during 1959 to 1976, earnings from sugar export showed an increase of 2572 72 per cent during the same period India exports sugar to over 10 different countries of the world of which Iran buys almost 40 per cent of the total sugar exported U.S.A. and U S.S.R are some other big buyers of Indian sugar. However Iran emerged as a single big buyer for Indian sugar in 1974-75 only, when our exports to this country suddenly jumped up from .21 lakh tons valued at Rs 4 crores in 1973-74 to 2.78 lakh tons valued at Rs 144 crores during 1974-75. The offtake by othe buyers during 1974-75 was Sudan Rs 45 crores, Indonesia Rs. 35 crores, U S.A. Rs 26 crores. U.A.R Rs 20 crores, Yeman Arab Republic Rs 12 crores, South Yeman Republic Rs 10 crores, Jordan Rs 11 crores, Morocco Rs 11 crores. The S T.C which is the channelising agency for sugar is hopeful of exporting sugar in substantial quantities during 1976-77 too.

Factors Affecting Sugar Production

Unfortunately, the rising trend of sugar output could not be maintained during the financial year 1975-76 due to variety of factors beyond the control of the industry. Sugar output declined to about 4.25 million tons (estimated). The two main factors which affected production are firstly withdrawl of excise rebate and secondly, continuance of the disproportionately high rate of excise duty on free sugar at 45 per cent ad valorem with consequent widening of tax disparity between sugar and khandsari, enabling the later to divert large quantities of cane. Because of decline in production, exports had to be curtailed On current reckoning only about 6 lakh tons sugar is likely to be available for exports from the 1975-76 season's production indicating a fall of more than 50 per cent. This is really unfortunate because the world prices have been almost established at quite an attractive level of around £ 200 per ton. According to an estimate the price of sugar will continue to remain stable in foreseeable future, therefore the need for the hour is to maximise the sugar output in the coming season i.e 1976-77 so that we are not only able to cover the lost ground but also are able to increase our exports further.

Production of sugar depends upon the quantity and quality of sugar cane available to sugar factories Thus, the problem of supply of adequate quantities of high quality sugarcane at an economic price is of paramount significance. Indian sugar industry, particularly in North India, is bounded by two factors: poor quality of sugarcane and its high price due to lower yield per hectare. Low productivity of sugarcane is the result of following old method of cultivation, inadequate use of manures and lack of sufficient. irrigation facilities and disease-free seeds. By and large, the requirement for raising cane productivity is quite well known and is the chief aim of the Cane Devalopent Programme No less important is the need for evolving new varieties of cane and for devising new scientific method of cane cultivation

Another important factor affecting our sugar exports is the high cost of production of sugar, which itself is the result of the high cost of raw material i.e sugarcane sulphur, Government taxes and manufacturing charges. It has been calculated that price of sugarcane accounts for about 45 per cent of the cost of sugar followed by Government taxes—cane seed, sales tax, income tax, excise—which constitute aboute 35 per cent of the cost of sugar, Other manufacturing charges like price for store, packing fuel, labour etc. account for about 20 per cent of the cost of production of sugar.

The selling price of sugar is so high that it is neither conducive to increase the home consumption nor in a competitive position in the international market. The cost of production of sugar is also high because of inadequate utilization of by-products and the seasonal character of the industry. At present sugar is produced either by sulphitation or carbonation process. In both these processes sulphur is used which is imported at very high price, thus increasing the cost of production of sugar. As in sulphitation process the use of sulphur varies from 0.05 to 0.08 per cent while in carbonation process it varies from 0.02 to 0.035 per cent Thus it is necessary to increase the use of carbonation process for reducing the costof sugar.

Another problem which is upsetting the exports production of sugar in the country is lack of integrated policy. There is an urgent need to evolve an integrated policy for regulating all the sweetening agents viz, gur, khandsari and sugar. The wide tax disparity between the said sweetening agents affects the competitive capacity of sugar factories in the matter of procurement of cane supplies Efforts should be made to exclude totally the khandsari units and power crushers from reserved areas of the factories To start with a blanket ban could be imposed in the reserved areas of the sugar factories No new licence should be granted nor any change in the names of the licences should be permitted nor further expansion of the existing khandsari units/power crushers operating in the reserved areas be allowed. Maximum price for gur and khandsari should be fixed and imposed in the beginning of each crushing season to avoid competition for cane prices among these three industries. Besides, the working hours of khandsari units, their date of start and also the quantity of sugarcane to be crushed may be fixed before the commencement of the season. All this needs to be done to avoid diversion of cane to gur and khandsari industry.

Another problem facing the industry in our country is the relatively small and uneconomic size of sugar factories The approximate sugar output per factory in India is 15,000 tonnes as compared to 40,000 tonnes in Cuba, 50,000 tonnes in Australia, 60,000 tonnes in South Africa and

(*Contd. on Page* 23)

Credit Facilities For The Neglected Section

HAIDER ALI KHAN

A LARGE SECTION of India's rural society remained neglected by the credit creating ıgencies before independence. This ;tate of affairs still continues in arge measure, resulting in the ɔerpetuation of rich and poor ;lasses with a widening gap between hem. The economy of the neglected ıegment of humanity, scattered and ınorganised as it always is, did not ıttract the attention of the powers hat be in the pre-independence lays and even for decades after. It s only since recently that the Go'ernment's approach has changed. The process began with the historic leoision in July 1969 to nationalise 4 Scheduled Commercial Banks vith a clear policy of preferential ıttention to the hitherto neglected ections of the society,

The neglected sector consists of ıgriculturists including small and narginal farmers, handcart pullers, ɔperators of horse carts and bullock ırts, rickshaw pullers, pan Bidivallas, tailors, barbers, dhobis, and number of other such self-emɔloyed persons whose credit requireıents had never been the concern of he Government.

The recent policy directives rom the Central Government has ɔut this class on a new footing. hey now form, for the purposes f bank advances, "priority sector". his new change in the situation is a 'elcome change and it will cause etter results on the social economy. he neglected sector will now conıbute in their own humble ways, ıeir best towards the national ampaign for high production and ɜmunerative employment of unkilled and semi-skilled labour.

Besides receiving considerate eatment from the banking intutions, the neglected sector njoy a relatively lower rate of iterest at 4 per cent. To achieve ıe objective of helping the deprived ɜctions the banks have drawn up schemes to extend credit to small borrowers in sectors like agriculture, small scale industry, road transport retail and small business. The Department of Revenue and Banking of the Central Government has recenty asked the public sector banks to take urgent measures to raise the proportions of advances to the neglected sectors to 33-1/3 per cent of the aggregate outstanding credit of the banks by the end of the Fifth Five Year Plan in the year 1978-79. It is a matter of satisfaction that the Union Bank of India has already achieved this target and has financed 36.47 per cent of its advances to this neglected sector for the year ending December 1975 But the percentage of bank advances to these people has been declining: It was in 1973, 37.16 as against 37.11 and 36.47 in 1974 and 1975 respectively. The bank advances to the neglected sector had gone up in the past The incrase was specially marked during the second half of 1974. The Bank advances stood at nearly 28 per cent in December 1975 as against 26 per cent in June 1975 A year earlier the advances to these sectors had accounted for 25.2 per cent. The increase after nationalisation has been rather spectacular with the advances to the neglected sectors when we compare it with the 14.9 per cent as it stood in June 1969. The amount outstanding against neglecled sectors in December last year was Rs 2321 crores as against Rs 1998 crores in December 1974 and a mere Rs 441 crores in June 1969. The total outstanding advances by the Public Sector banks in December 1975 accounted for 8329 crores as against Rs. 7676 crores in June last year and Rs. 30.17 crores at the time of nationalisation. The number of borrowal accounts pertaining to agriculture, small scale industries and road and water transport, retail trade and small business professional and self-employed persons and education stood at 41 lakhs in December last year as against 33 lakhs, six months earlier marking an increase of 8 lakhs. The number of borrowal accounts at the time of nationalisation was only 2.60 lakhs.

The existing financing measures to this sector are still not adequate and are deficient in many respect. The consumption loan specially in the off season is not allowed as per requirement Hence the advances made for actual production are suspected to have been diverted to unproductive consumption There seems to be a case, therefore, for consumption loans to be released more liberally in order to attain the real results out of this Sector. A few suggestions are offered to make for effective performance of the neglected sector:

1 In case of failures in the first attempt under this sector, there should be provision for refinance under certain conditions This seems necessary so that the failing units and the persons may get, under proper security, one more chance to stand on their own feet.
2. The marketing of goods and services under this sector may be entrusted to an autonomous organisation formed for the purpose, under the overall supervision of the Central or State Governments.
3 Small farmers are required to produce non-encumbernce certificate while borrowing from banks at a cost of about Rs. 60/-. This is a costly and inconvenient procedure. A less expensive and crediable declaration may be evolved
4. The cattle advances are covered by General Insurance and the charge for these are @5.5. per cent. This is quite expensive. Moreover, it does not give the cattle complete insurance coverage The facility of cattle loan is at present restricted to the land holders only. To make this loan more beneficial, it seems desirable that it should be open to the landless too.

It may be hoped that if the neglected sector is given more liberal backings and is allowed to play its role more actively, it will bring radical changes in the society and will promote the economic wellbeing of thousands of families who are on the subsistance level. ☐

World Bank Aid For Kerala

R. HALI

TRULY, IT IS the ever green tree crops that make Kerala the "Green paradise of India" in the eyes of tourists More than 70 per cent of cultivated area in the state is covered by tree crops like the coconut, cashew, pepper and rubber. In short, cash crops form the backbone of farming economy of the state Several lakhs of small farmers earn their income by nursing these crops and processing their products daily.

New farming innovations like mixed farming, multitiered cropping systems, etc if implemented in a scientific manner coupled with rejuvenation of the existing tree crops in the gardens and homesteads, will pave way the for new prosperity among the farmers in the State. Small, marginal and sub-marginal farmers, who constitute a sizable portion among the economically weaker sections of the community welcome the massive World Bank aided 'Kerala Agriculture Development Scheme' popularly known as the 'tree crop development programme.' Six of the eleven districts of the state are covered by this biggest ever tree crop development scheme; 74,000 farming families are expected to participate in this project and thereby derive benefits from the schemes which call for a long term investment of Rs. 62.12 crore of which Rs. 27 crore will be the contribution of the World Bank.

Shri Hali is Principal Information Officer, Farm Information Bureau, Trivandrum, Kerala.

India imports more than one lakh tonnes of raw cashewnut every year. This has to be reduced. The World Bank aided Kerala agricultural development programme will help boost up the internal production of raw cashew.

A good cashew tree. Cashew comes up well even in the most neglected soil.

A pepper nursery producing quality seedlings

Coconut development has been given a place of great prominence in the programme. Fifteen thousand hectares will be brought under coconut cultivation at the rate of 5,000 hectares each in the districts of Cannanore, calicut and Malappuram.

30,000 hectares of existing coconut gardens will be rehabilitated in the districts of Trivandrum, Malappuram, Calicut and Cannanore. 25 per cent of the area under coconut covered by the programme will be provided with irrigation facilities. Massive assistance will be provided for cultivators to grow cocoa, tree spices and fodder as inter crops in the coconut gardens, brought under the purview of the scheme.

Crumb rubber factories are a must to help the small growers. 18 Crumb rubber factories will be established under the programme.

Pepper, the king of spi[...] gets a royal treatment for [...] development. In the prem[...] pepper producing districts [...] India, namely Idukki, Ko[...]yam and Cannanore ten tho[...]sand hectares of pepper gard[...] will be rejuvenated by intens[...] replanting, interplanting, [...]nuring and plant protect[...] operations.

Cashew production too will [...] given a big boost so as to en[...]nce the internal production [...] reduce the import of raw cash[...] 2280 hectares in the governm[...] cashew plantations will [...] developed and 1480 hecta[...] will be brought under cash[...]

Above right : Kerala is well known fo[...] production of rubber. Here rubber is bei[...] extracted from a fully grown tree.

In the coconut gardens pepper and several other spices will be grown to boost up farmer's income.

cultivation afresh in the reserve forests.

50,000 rubber growers will be benefitted in a big way by extending facilities to start 10 huge crumb rubber processing factories in the co-operative sector.

Special Animal Husbandry and Dairy Development facilities are to be extended to farmers who take up fodder growing and cattle rearing in the areas covered by coconut rehabilitation programme.

Gigantic efforts are required to educate and motivate and educate thousands of small farmers on the technological content of the programme. To provide input support to the programme, a full-fledged seed garden will be established from where the requirement of coconut seedlings, cocoa seedlings, spice seedlings, etc will be produced on a massive scale

The programme is expected to produce, when fully implemented, additional 200 million coconuts, 6000 tonnes of pepper, 2000 tonnes of cocoa, 6000 tonnes of raw cashew, 15,000 tonnes of milk and 40,000 tonnes of other food materials. The ten crumb rubber factories are expected to help 50,000 small rubber holders to convert 25,000 tonnes of low quality of rubber into superior crumb rubber. □

15000 hectares will be brought under coconut cultivation and 30000 hectares of coconut gardens will be rejuvenated under the programme.

Railway Budget 1977-78

COMMUTERS SPARED

THE RAILWAY BUDGET for 1977-78 presented to Parliament on 28-3-77 has not proposed any change in the Passenger fares or freight rates. It envisages a surplus of Rs. 264.5 million. All the railway employees who were either suspended or dismissed as a sequel to their participation in the railway strike in May 1974 are to be reinstated unconditionally.

Presenting the budget the Railway Minister said that in the ensuing year passenger traffic was expected to increase by 6 per cent and the originating revenue earning freight traffic is being targetted at 217 million tonnes, 11 million tonnes more than anticipated in the current year.

With these traffic prospects gross traffic receipts at existing passenger fares and freight rates have been estimated at Rs. 20914.4 million Passenger earnings account for Rs. 6070 million, other coaching earnings Rs 923.1 million, goods earnings Rs 13627.6 million and sundry earnings Rs 543.7 million An amount of Rs 250 million out of these earnings may not, however, be realised during the year.

The estimate of working expenses for the year, has been placed at Rs 16357.5 million. These expenses take into account removal of anomalies arising out of recommendations of the Third Pay Commission and upgradation of certain non-gazetted posts for improving their career prospects Increased provision has also been made for maintenance of track, rolling stock and other equipment for keeping them in good fettle and traffic worthy. Provision has also been made for additional fuel requirement to meet the projected higher level of traffic

Besides, appropriation to the Depreciation Reserve Fund has been raised to Rs 1400 million in keeping with the proposals accepted by the Railway Convention Committee in their deliberations. The contribution to Pension Fund has also been enhanced to Rs 400 million to meet the anticipated higher withdrawals. Expenditure on Open Line Works chargeable to Revenue and miscellaneous tractions is expected to be Rs 236.7 million. Dividend liability to General Revenues for 1977-78, based on arrangements approved by Parliament for 1976-77, is estimated at at Rs 2255.6 million. Inclusive of these items of expenditure the estimated surplus for 1977-78 is of the order of Rs 264 5 million

Phenomenal Increase in Passenger Traffic

The Minister said that increase in passenger traffic during the current year has been phenomenal. During April to December 1976, the originating suburban passengers recorded an increase of more than 10 per cent and non-suburban passengers of 24 per cent as compared to the corresponding period in the last year. The increase, was due to the combined effect of check on ticketless travel, alround improvement in passenger train operation, introduction of new trains and expansion of the run of some of the existing trains

Taking all these factors into account, the Minister said, that the Gross Traffic Receipts for 1976-77, were now estimated at Rs 19875.5 million—an increase of about Rs 320 million over the Budget.

Saving in Working Expenses

In spite of increase in traffic over the budgeted level, the Revised Estimates of the Working Expenses record a net saving of about Rs 30 million over the Budget as a result of better efficiency and tighter expenditure control. He said, actual savings could have been more but for inescapable additional expenditure to meet the increased requirement of fuel, lubricants and other materials necessitated by higher traffic as compared to the Budget.

The Minister said that the Railways were now expected to close the current financial year with a net surplus of Rs 356.7 million as against the modest surplus of Rs 89.8 million anticipated in the Budget.

Excellent Performance

Taking stock of the performance of the Railways in 1976-77, the Minister informed the House that in almost all spheres of railway working, the Railways excelled the best norms that had ever been achieved before. The menace of unauthorised travel agents and anti-social elements indulging in malpractices in seat reservations has been largely eliminated. Booking and reservation counters at large stations have been increased. Over-crowding in trains has been reduced substantially not only as a result of introduction of additional trains, but also by a continuous watch on ticketless travel.

Cleanliness in trains and railway stations has improved. There has been marked improvement in the catering services. The trains maintaining punctuality at present average over 90 per cent as compared to 65 per cent prior to 1975.

The Minister said that a number of super-fast long distance mail and express trains to connect important State capitals and cities, reducing their journey time and providing a more comfortable travel had been introduced during the year. Some of the trains were the Tamil Nadu Express, the Karnatak-Kerala Express, the Jammu Tawi-Bombay Express and Gomati Express. Another important development during 1976-77 was the resumption of Indo-Pak rail traffic with effect from July 22, 1976

Complimenting the staff for the high calibre of performance and unfailing commitmen to the tasks assigned to them, the Minister informed the House of the various steps that have been taken for labour participation in management. He said that he would strive to introduce a new element of dynamism in management-labour relationship.

The Minister said, the Railways owe a sizable debt to the General Revenues on account of temporary loans obtained for Development Fund and Revenues Reserve Fund expenditure. The Budget for 1976-77 envisaged the Railways' indebtedness as on March 31, 1977 to be Rs 4915 million. According to the Revised Estimates, this figure is expected to be reduced to Rs 4619.9 million at the end of the current year. The indebtedness to General Revenues is expected to be of the order of Rs 4771.8 million, at the end of 1977-78. □

Simulator For Calcutta's U-Railway

RAMEN MAJUMDAR

A CERTAIN BABOO was travelling by a carriage from ·Kalikata to his home some ittle distance from the town The carriage crept forward with mournful slowness. The horse was one of the offsprings of pegasus described by Baboo Tekchand Thakore No sting of whip could induce it to change from a walk to a trot On the way, the Baboo met a neighbour of his, a Brahmin pundit, who too was going home. "O, Venerable Crown-Jewel. Pray come with me in my carriage," said the Baboo But the old man replied "Baboo, I have pressing tasks at home, I must get there quickly".

That was from Rajnarain Bose's 'Sekal O Ekal" ("Times Past and Present").

This vignette from the pen of Rajnarain is of Calcutta at the beginning of the past century But do we not, faced with the choice of taking the public transport or using our own trusted legs, often decide like the venerable Shiromani to walk rather than ride? "You have to be back home in time? Better walk" The reason. the town has grown, the population has multiplied, but its streets are as narrow as ever. Putting fast vehicles any more on the streets will only clog them further.

The only solution to unclog the streets is the underground railway. and the authorities are already on such a project.

Since the underground railways operate on electrical power, it is essential to know how much power the trains consume and what are the voltages required at different stations.

Besides, there are two problems to be considered for Calcutta First, its warm and humid weather Secondly, its limited power supply

Calcutta is known for its humid hot weather for a large part of the year. So, one may aptly ask : Will it not be more hot and humid underground? Will not the power consumed by the trains contribute to inconvenience of the travelling public?

It is well-known that when an electric current flows through a cable, wire or conductor, heat is generated due to the resistance of the element Also, if there is any mechanical movement against some friction, just as is offered by brakes, heat is produced again.

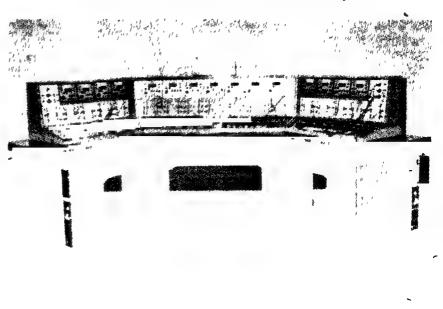
The underground railway will have a huge network of cables transmitting electric currents The major portion of the power consumed by a train will be pumped out in the vicinity of the platform during starting and braking For, when the train brakes while approaching a station and stopping at the station, all its stored kinetic energy dissipates at the braking resistors and the brake shoes as heat. Similarly, while starting, the train motors are connected to starting resistances which, in turn, dissipate heat in the vicinity of the station

Therefore, one very important aspect of the studies is to be directed towards determining the minimum consumption of power. This will entail minimum generation of heat causing less discomfort to the commuters and what more, less consumption of a rather dear resource, namely electricity. Also, the minimization of heat will cut down the sizes of the pumps and fans necessary for ventilation and airconditioning. This will further reduce the expenditure.

Again, conservation of power is very important for a city like Calcutta facing power-shortage. One way to plan for minimizing power consumption is to use a power system simulator. A simulator will help analyze what measures are to be taken to reduce the consumption of power.

For example, what should be the principle of preparing the time-table for running underground trains so that the consumption of power is minimum. Assuming, a train is planned to start from the Dum Dum and at a certain point of time It is possible to schedule another train to leave the other end, that is the Tollygunge end, at exactly the same instant. But the train may be delayed by some time, say half-a-minute or a minute This slight displacement of time will mean nothing to the travelling public, for they will not feel the difference at all But this can cut down the power demand of the train considerably, saving several thousand rupees a month. This further cut down in power will correspondingly reduce the generation of heat resulting in lesser discomfort to the commuters

The Control Systems Division of the Electrical Engineering Department of Jadavpur University has developed a simulator for the Calcutta Underground Railway Project. The total cost of the device is about Rs 1 lakh and the foreign exchange

The Power System Simulator for Calcutta's U-Railway


component does not exceed even Rs 1,000. A very sophisticated device, it will help the project engineers in assessing the power requirement in different sectors of the underground railway, in measuring the current on the line if there is any short circuit anywhere in the system, in locating faults and traffic conditions at a particular period and in determining the optimum train composition.

What is a simulator? It is an equipment which duplicates certain physical performances of a system in lower power level, where the system becomes manageable by a person or two, the different aspects of the actual system can be changed at will, and the performances can be gauged quantitatively. For instance, in this simulator, an actual substation has been replaced by a small electronic power supply so designed as to behave like a generator in a scaled down form. Here an actual 100 volts is scaled down to only 1 volt and an actual 1,000 amperes flowing in the substation cables is scaled down to one thousandth of an ampere, i.e. a milliampere Thus when we find in the simulator that at a particular time the voltage between two points is 6 5 volts or the current through a line is 5 milliampere, we say, after scaling these, that under these conditions the voltage is at 650 volts and the particular current is representing 5,000 amperes in the actual line. The simulator has been built entirely with electronic circuits. It has been designed in such a way that it will not only solve the problems of the underground railway in Calcutta but also of those in Delhi, Bombay and Madras. It can even be employed to solve the problems of surface railways, especially in suburban areas

Designed and built for the first time in India, the simulator has saved a considerable amount of foreign exchange and will also do so in future by eliminating the need of importing foreign know-how in this respect. □

Sugar

Contd. from Page 16

80,000 tonnes in Egypt. Not only this, about 55 per cent of the total sugar factories fall in the range of 10,000 to 15,000 tonnes, and 25 per cent in the range of 5000 to 10,000 tonnes Hence efforts have to be made for increasing the capacity of these factories either by their expansion or by merging smaller units into larger unit

Most of the sugar factories of North India are financially weak The plant and machineries which were installed in the thirties (1930) in most cases have become obsolete and need immediate rehabilitation and modernisation The management have neither the finance, nor interested in replacing the old machineries because they are not certain of getting reasonable return on their capital investment. One of the reasons for this sorry state of affairs is shorter cane crushing season due to diversion of cane to less productive industries like gur and Khandsari. The Gundu Rao Committee has recommended the setting up revolving funds for the rehabilitation of uneconomic units. The main cause of the bad plight of the sugar factories is that they are generally starved of raw materials The revolving fund will no doubt help to some extent. However, rehabilitation, modernisation and expansion of these units is of greatest urgency and importance. This will have to be done simultaneously with the intensive development of sugarcane.

Another factor which is upsetting the sugar industry in the North, a factor that is perhaps common in many fields of activities is the lack of co-ordination between research and development while the research worker find himself helpless to translate his ideas into field practice, the development wing complains of the lack of appreciation of practical difficulties that makes the research findings of little value. It appears that the solution even to this problem lies in bringing the industry into picture by its participation as an active coordinator with an interest and stake and a valuator of research findings □

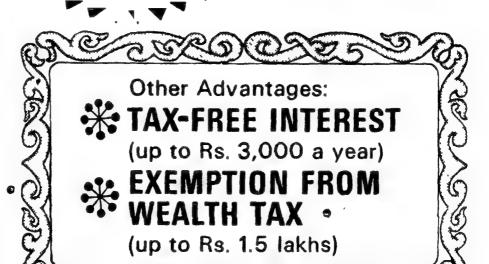
GRASS ROOTS IN THE CITY

V. K. DETHE


NEARLY 600,000 people have no roof over their head and sleep on the pavements of Calcutta. The dreary chawls of Bombay and Ahmedabad are eyesores, but hordes of people live in them. Slums in other parts of the country are no better. Built on smelly, polluted drains or vacant government land, they are overcrowded and insanitary. Most slums are virtually unlivable, by conventional standards, but peasants continue to forsake their villages and swarm into the cities.

What motivates the peasant to migrate to the city? Many are caught between the crunch of over-population and diminishing land holdings and flee to the city in search of employment. Others are victims of the Green Revolution, their simple skills no longer needed in the village. Drought and floods force others to quit All come to the city in search of the great urban dream—a better life, if not for themselves, for their children

For Pandu Ram Bansur the quest started three years ago when crops in his village suffered because of insufficient rains They stuck it out for another year but it was no good He had to quit the village, leaving the land to his younger brother Finding his way to Delhi, he moved in with a 'brother' who had migrated earlier from the village Pandu Ram did odd jobs till he was able to secure employment with a confectioner in a South Delhi colony He shifted to a nearby slum and built his own "jhuggi' shack from scrap—wood and thatched mats. He had put down his first roots in urban soil He wrote to his pregnant wife, Shobhai, to join him.

Shobhai still recalls with a shudder her first glimpse of the capital She had spent a sleepless night in the packed compartment Her two children, a boy and a girl, had cried throughout the night. Her husband met her at the station though it meant losing a day's salary. The mini bus dropped them a couple of kilometres from the jhuggi colony and the family had to trudge 'home'. They had a meal of dry chappatis and pickle and went to sleep.

Shobhai awoke next morning to see an indescribable huddle of jhuggis. She felt utterly alone and her loneliness increased when her husband left early for work. Luckily, a kindly middle-aged woman in a neighbouring jhuggi befriended her and she was later responsibe for Shobhai getting a part-time job as a maid The elder child, a son, started going to school while the younger daughter accompanied Shobhai to work Shobhai had to leave the job when her pregnancy advanced.

At this stage she really started missing her parents and relatives She longed for the warmth and security she had left behind. Her husband tried to divert her mind by taking her to the movies, but it did not help She did, however, develop a taste for films and hardly missed an opportunity of seeing one. But the unfamiliar loneliness persisted The first Diwali festival was spent alone with the children as her husband was working overtime

Shobhai's adjustment to city life was slow Her first tentative attempts at make-up, in imitation of the younger neighbouring wives, left her in giggles. She however took the plunge and now wears one of the cheap garish lipsticks sold outside railway stations by pedlars. She has also started wearing the cheap city trinkets in preference to the heavy silver jewellery which she wore in the village. Her wardrobe, all of which can be contained in one small trunk, now includes two synthetic fabric saris, one of which was gifted to her by the mistress of the house where she once worked as a maid. These are only worn on special occasions.

Her third child, a son, was born in a hospital. For Shobhai it was a unique experience in that her two other children had been delivered in the village with the help of the local 'dais'. She had at first refused to have the child at hospital, preferring to go back to the village and be with her mother. But there was no money for the train fare. The hospital terrified her. And the brusque manners of the younger doctors only added to her discomfort. The child birth, however, was without complications.

Though she had vaguely heard of family planning, her first brush with it came while in hospital. A social worker visited the maternity ward to persuade women to go in for sterilisation. Shobhai did not need much convincing when the advantages were pointed out In any case, she feels, the eligible women could not really have evaded taking the step.

One of the major crises to affect the Bansur family came in February 1976 when the entire slum colony where they were living was given orders to shift to a new location on the city's outskirts. They had become part of the resettlement scheme that moved 700,000 people out of the core of Delhi.

The shift was not without its inconveniences The family stayed in the open for a couple of days. The first night it poured and their clothes and bedding were soaked. Today, a year later, they are staying in a makeshift structure which has kept out wind and rain so far

Adjustments to the demands of living on the urban periphery continue. The elder son's education was interrupted for some time but he soon got admission in a newly-started municipal school. But money continues to be a problem and this has become more acute with the shifting Nearly Rs 40/- from a total salary of Rs 150/- is spent by Bansur in commuting by bus. Earlier, his expenses under this head were nil. The family finances have taken another dip with Shobhai's brother coming to live with them. The brother works as a casual labourer earning about Rs 7/- a day but this is not a regular income He is sick most of the time and misses work. Hospitalisation, particularly the medicines, cost money which the family does not have They pin their hopes on their getting an unskilled job at an industrial estate coming up five kilometres away.

On her part, Shobhai hopes to learn a craft at a nearby welfare centre being run by a voluntary agency Another idea is to run a little store, selling cigarettes, matches and the

Jewellery Exports—

Wide Scope in Gulf Countries

SUBHASH J. RELE

THE EXTREME satisfaction so often expressed by official sources over the steady increase in gem and jewellery exports over the years is justifiable From a not so impressive level of Rs. 100 million in 1965-66, gem and jewellery exports have risen to more than Rs 1047.2 million in 1975-76 i e a twelve-fold rise in just ten years This trend is being maintained during the current years; in the first five months the exports amounted to Rs 494 million against Rs. 436 million in the corresponding period of 1975-76. The trade has reasons to exude confidence about the future and it expects to double the exports to Rs. 2500 million annually in the next five years Some people in the trade feel that this target can even be exceeded if the Government comes forward to meet some of trade's demands

Not many in our country are aware of some of the distinguishing features of this industry. First, it is an entirely export-oriented industry As a spokesman of the industry disclosed the other day that the industry imports raw materials required by it from abroad since the domestic production of these items such as rough diamonds, precious and semi-precious stones, synthetic stones and raw pearls, etc. is very small But all the raw materials imported are re-exported after cutting polishing or processing or studding them in jewellery Secondly the industry provides employment to about 1,50,000 people. This is perhaps the largest labour force in this industry in the world.

Imbalance in Pattern

The industry is trying to enter the non-traditional markets to rectify the heavy dependence on traditional markets which claim nearly 90 per cent of the total Indian exports. A delegation sponsored by the Gem and Jewellery Export Promotion Council has found that there is vast scope for promoting exports of gems and jewellery to these countries Iran's offtake of diamonds is quite substantial; the quantities in demand range between very cheap 666 varieties valued at $ 50 per carat and $ 120 per carat. Single cuts are also in demand Indian-cut gems enjoy a very big market Kuwait is another potential market for gold jewellery But importers and exporters complain about cumbersome procedure at delays. The import duty on gems and jewellery is just 4 per cent The total production of jewellery being inadequate to meet the rising demand, there is bright scope for pushing our exports to this area The business men in Kuwait are willing to supply gold for conversion into jewellery and re-export. In Bahrain, gem-studded jewellery made of white gold is generally preferred while gold will have to be imported if this trade is to be developed

Dubai is another potential market for gold jewellery It is felt that export business worth millions of rupees can materialise if the procedure to import gold if simplified The delegation has suggested that Indian jewellery manufacturers should be supplied gold at international prices to enable them to manufacture and export jewellery. Besides, jewellery exporters should be allowed to import samples of foreign jewellery as also sockets, moulds, models, clasp and metal fittings. The suggestion that the manufacturers should be allowed to import necessary tools and machinery is also sensible The delegation stressed that the import duty on semi-precious stones and cultured pearls, which is quite high, should be removed If this recommendation is accepted it will enable the Indian products to compete wth Israel and Belgium, India's main competitors. Moreover, foreign buyers wanting to come to India to buy gems and jewellery should be given all possi ble assistance by the authoritie concerned.

More Diamonds

In the gem and jewellery export diamonds would continue to pla a vital role. The latest decision o the Diamond Trading Company Britain, to liberalise supplies o rough diamonds to India will giv a further fillip to exports The de cision is expected to increase th DTC's supply from 58 million dollar in 1976 to anything from 75 millio dollars to 100 million dollars nex year It is estimated that the DTC supply of this order will help to gene rate export of finished diamond worth Rs 1100 million to Rs. 135 million in 1977. The recent survey show that exports of upto Rs 200 million a year are attainable much earlier than envisaged

The finance constraint will prov to be the main stumbling block The industry has definitely a cas here The present sanctioned bank limit to the diamond processing industry is stated to be Rs 32 crores The increased DTC supply of rough diamonds will need an average utilisation of bank finance amounting to atleast Rs. 500 million The industry claims, and rightly so, that industry in Israel and Belgium gets adequate bank finance Diamond industry in Israel gets 300 million dollars of bank finance aganst its total exports of 800 million dollars, and industry in Belgium gets bank finance as large as 420 million dollars against its exports of 910 million dollars If the Government of India fails to assure bank finance of at least Rs 500 million to diamond industry, it would be a case of missed opportunity One hopes, in conformity with the recent trends in policy formulations, the Government will adopt a pragmatic approach to the industry's problems. □

Yojana Quiz

1. Who Founded Agra and in which year?
2. Which railway station in India has the shortest name with only two letters.
3. The longest railway bridge in India is
   (*a*) Vivekananda Setu
   (*b*) Sone bridge
   (*c*) Yamuna bridge
4. First official air-mail flight was on
   (*a*) 1st October, 1854
   (*b*) 26th January, 1900
   (*c*) 18th February, 1911
5. The Longest dam in the world is
   (*a*) Hirakund (India)
   (*b*) Mica (Columbia)
   (*c*) Nurek (USSR)
6. Which river in India rises from the snout of the Chemayungdung glacier near the Tachbog Khabal Chhorten?
7. Himalayas cover about
   (*a*) 10020 sq km
   (*b*) 500,000 sq. km
   (*c*) 2,30,000 sq. km.
8. Which Lunar crater has been named after an Indian?
9. First 120 mw unit of Rs. 90 crore Santaldih thermal power station in West Bengal was commissioned on
   (*a*) 15 October, 1973
   (*b*) 15 August, 1948
   (*c*) 26 January, 1960
10. What is INS Garuda in Cochin?

Answers:

1. Sikandar Lodi in 1494
2. Ib railway station on the South-Eastern Railway between Jharsuguda and Brijarajnagar in Orissa
3. (*b*) Sone bridge. It is 10,052 ft. long and has 95 spans, each 100 ft. apart
4. (*c*) 1911, 18 February from Allahabad to Naini junction.
5. (*a*) Hirakud [illegible] miles
6. Brahmaputra river, the place is about 100 km South-east of Mansarovar
7. (*b*) 500,000 sq. km.
8. Bassel named after the Late Dr. Vikram Sarabhai at the Sydney meeting of the International Astronomical Union on the 17 March, 1974.
9. (*a*) 15 October, 1973
10. Indian Navy's Second Sea-King Anti-Submarine Air Squadron.

Quotation Box

He (Mr. Bhutto) should be seen, rather, as the fastest gun in what is still, politically, a frontier society—determined to hold on to power, frequently abusing it, but also using it to push and pummel his half-developed, half-primitive country into the modern world.

Women's Lib and the Underworld

A REPORT ON FEMALE CRIMINALITY IN INDIA

Over the past few years more women have taken to crime in most of the countries of the world, including India. Statistical data show that women's lib could not certainly be the cause for the increase in the number of women criminals in India. Could it be female subjugation?

M. BILMORIA RANI

A NEWS DESPATCH from London as reported in Indian Express dated February 24, 1977 says that "crime is increasing every year in London and more women are getting in on the act . For the first time, burglaries in 1976 exceeded the 100,000 mark in London with a growing number of women joining men in crime teams" The news despatch further says that in this 'Women's Lib of the Underworld', girls and women were acting as decoys or doing the breaking in for burglaries

Female criminality was also a subject of discussion in the Fifth Nations Congress held at Geneva from September 1-12, 1975 The Congress noticed that "While the proportion of women in the total criminal population still remains relatively small, crimes committed by them are rising faster than those by men". In the U S A the increase in the arrest rate among females from 1962 to 1972 was three times higher than among males In Japan the number of female offenders increased from 9.8 per cent in 1962 to 13 6 per cent in 1972 In the Federal Republic of Germany, the percentage of female offenders increased from 15.4 in 1963 to 17.1 in 1970. In Canada, the percentage of women offenders charged with indictable offences rose from 7 in 1960 to 14 in 1969 Norway recorded a sudden spurt in female criminality from 4 per cent in 1958 to 10 per cent of total crime at present New Zealand reported a dramatic increase in female crime rate after 1960 In these countries the increase in female juvenile delinquency has been sharper than the general female criminality In Poland, however, a steady decline was reported In that country the number of women prisoners fell from 25 9 per cent in 1951 to 11 4 per cent in 1972

In India also the situation is not bright As against 16,303 women arrested under Indian Penal Code in 1971, the number rose to 27,891 in 1972 But as pointed out by N K Sohoni in the Illustrated Weekly of India (August 25, 1974) one of the distressing features is the regional concentration of the female convicts Around 73 per cent of female convicts are from Andhra Pradesh, Maharashtra and Tamil Nadu As regards the juveniles the number of girls arrested under Indian Penal Code has gone up from 4,801 in 1968 to 7,228 in 1972 According to the statistical analysis of the Central Bureau of Correctional Services "educationally, 33 per cent of men convicts are literate while 12 per cent of women convicts are literate Among women convicts, almost 73 per cent are married, about 15 per cent are unmarried, 12 per cent are widows " Among women and girl convicts, the largest group of 40 per cent convicts are in the age bracket 21-30 years followed by 30-40 years which account for about 32 per cent The age group 16-21 years of female convicts constitute about 10 per cent of the total women convicts admitted to jails in India."

Types of Crimes

Women commit various types of crimes but no published data is available on the exact nature and type of crimes committed by them Ram Ahuja made an empirical study on women criminals and the pattern of crime among the women convicts and probationers in the State of Rajasthan in the year 1966 67 According to his analysis out of 49 female convicts 39 committed offences against person, 7 committed property offences, and the remaining committed minor offences.

A preliminary analysis of the data collected by this author from the two jails of women in Andhra Pradesh revealed a similar trend. Out of a total of 120 female convicts, 54 females committed offences against person, 23 committed property offences and 43 were involved in minor offences The data further showed that many women committed murders, thefts and took to prostitution, kidnapping etc , due to bad matrimonial or family relations or bad economic conditions

Of late different kinds of reports have been made on women criminality Saroja Natarajan reporting on the activities of women pickpockets in Bombay in *Eve's Weekly* June 21, 1975, says that the women pickpockets "are most active during peak hours when trains and buses are packed Their favourite period of activity is the beginning of the month from about first to the tenth" The women pickpockets concentrate on the women's compartments in trains and at bus stops Saroja reports a curious practice among the Mangarudis who belong to the category of criminal tribes. She says that a common custom among the women of this community is to commit an offence just before delivery and plead guilty so that when convicted the delivery expenses would be at Government's

The author is U G C Junior Research Fellow, Department of Sociology, Andhra University, Waltair.

cost and they'd get better facilities free of cost Most of the women pickpockets in Bombay are trained by the Mangarudis Women take to pickpocketing both because of their bad economic condition and due to the influence of bad company and continue in the profession because of the obvious advantages. According to Saroja a few of the picknockets in Bombay are also kleptomaniacs She says one such maniac is a middleaged Sindhi lady The police have never been able to get the exact details as to her story, family background, etc She never tells the police anything But they are positive that she comes from an affluent family. Once in a way she is arrested for petty theft but she disappears again for some time. The last time she was arrested was in Delhi a few months back

R D Jah reports the case of a woman criminal 'Puth', who was a member of a group of dacoits in Chambal valley and was superior to other criminals both physically as well as mentally Puth was probably the most daring woman dacoit in the country Born to a prostitute she herself entered into her mother's profession Once she came into contact with a criminal dacoit, and married him she herself became an active dacoit. Of course, this is a rare case of its kind

In April 1976, a 30 years old woman entered into the district headquarters hospital at Eluru in Andhra Pradesh with a stethoscope and walked away with the gold necklace of a woman patient The woman pretended to be a doctor and asked the rich patient to lend the necklace to her for a while so that she could show it to her doctor husband downstairs The "doctor" left her stethoscope on her bed signifying her intention to return soon but did not do so This is a clear case of cheating. It is interesting to note that the ex-Maharani of Kolhapur has put on the garb of 'mataji' and cheated a number of devotees who came to her for blessings (*Andhra Jyoti*, Mar 29, '76).

Sometimes crimes are also committed owing to sheer belief in the efficacy of certain crude magico-religious rituals and sacrifices On November 22, 1975 in Pune one lady sacrificed the lives of a number of virgin girls at the altar of goddess Munja with the soul objective of receiving the blessings of the goddess for her own physical and spiritual welfare. Of course, such incidents are usually reported from tribal and semitribal areas, and the causes generally lie in the tradition and culture which are respected by the groups

Women also indulge in different types of criminal and antisocial activities with a view to improving the economic conditions of their families Sometimes they think that involvement in such activities is not bad and in fact, in some cases the men also encourage the women According to one report women of the fishing folk take recourse to gambling during their leisure time when the men are away on the sea to catch fish. This way they earn five rupees a day out of which they spend one or two rupees towards the family and the remaining amount is saved for their individual recreation or for gambling in future. This habit has led to a number of intra-family and inter-family conflicts in the fishing community The impact of this is seen very much on the children as well

Women also work as accomplices in different criminal activities It is observed that many a time women take up the job of illicit distillation and selling of liquor at the instance of or as a partner of her husband or other relatives Many of the brothel houses are managed by the men and women together Women as well as men act as pimps or procurers of girls Brothel runners keep their girls for training in the profession It is reported that traffickers in girls have set up a chain of centres all over the country. These centres obtain girls through kidnappers and other sources and distribute them to brothels throughout the country A news item from Meerut says that "while they scan, the hill areas of U P and the tribal areas of M.P , Bihar and Rajasthan, their contacts operate in the south which is said to have become the main source of supply ever since the procurement of girls from Nepal became difficult" Similar practices are reported in the southern states as well These days clandestine prostitution is becoming rampant While some girls take to prostitution for economic reasons, some others fall victims to the procurers for various other reasons The ambition to become cinema stars drives many young girls away from homes into the lap of the procurers. Some working women with a view to maintain 'higher' standard of life act as call girls too.

There are cases where women kill their husbands or paramours out of revenge. B.J Karkaria writes that a woman called Manjura, aged 30, 'together with her lover allegedly killed her husband with a scythe and sickle and threw his body in a well The husband was drunkard, the lover, Kamath, was "fair and of high caste" Poisoning is the usual method of killing used by women Niranjan Patel writes that "very seldom does a woman kill in a moment of uncontrollable emotional heat or frenzy. once a thought of murder enters a woman's mind it is impossible for her to get rid of it It becomes a merciless monomania which she has to translate into actuality". This statement, however, requires a careful empirical testing

Unfavourable Social Conditions

This cursory survey suggests the need for a thorough improvement in the social and economic conditions of the women Today in most of the countries social conditions are not favourable or congenial for the growth of the personality of women Various legislative and executive measures need to be taken to improve the lot of women Improvement in the status of the women would remove many of the undesirable causes and consequences in the area of human or social relations. It is significant to note that some feel that the spurt in women liberation would indirectly encourage women criminality It was pointed out in the Fifth Nations Congress on the Prevention of Crime and the Treatment of Offenders that "the increasing involvement of women in various walks of life and the decreasing disparity between the sexes in terms of socially defined roles were recognised as factors correlated to the increase in female criminality in most of the countries" If it is so in the developed countries, it should be our endeavour to look into the problem more carefully and find out the real causes behind the increasing criminal behaviour. It will be erroneous to think that mere increase in per capita income would automatically set the social relations or make them better. We should of course not overlook the fact that Poland showed decline in the incidence of female criminality despite the fact that her woman too is very much free Probably the difference lies in the very nature of the political, economic and social systems of the developed countries As the data show, so far as India is concerned female liberty could not certainly be the cause for female criminality. Here, on the other hand, female subjugation is the cause for female criminality □

SURPLUS BUDGET FOR MAHARASHTRA

AVINASH GODBOLE

Bombay Correspondent

THE 'NEW STATE budget for the year 1977-78 is a tax-free budget, though modifications in the rates of excise duty especially on liquor and beer are expected to yield about Rs. 293.4 million as additional revenue. The estimate envisages a surplus of Rs. 931.1 million on revenue account and a deficit of Rs. 884.9 million on capital account, leaving an overall surplus of Rs. 46.2 million. The estimates provide a number of reliefs which involve a financial burden of Rs. 67.2 million and taking into account the unbudgeted plan outlay of Rs. 143.8 million, the overall surplus is expected to be converted into an overall deficit of Rs 97.6 million.

Some of the reliefs provided in the budget pertain to revision of rate of sales tax in respect of certain commodities and increasing the exemption limit for the purpose of sales tax in respect of small shopkeepers and others, from Rs. 30,000 to Rs. 50,000. With a view to give relief to the weaker sections of the society, the sales tax on kerosene is completely being removed.

Small farmers have been given relief in the form of exemption from the land revenue and cess which they have to pay to Gram Panchayats, and local authorities. According to the proposal, farmers paying Rs. 5 or less as land revenue, will be entitled for this benefit from Aug. 1, 1977. This will help about 20 lakh land holders i.e. about 40 per cent of the total number.

In order to offset the loss in revenue because of the various concessions, the rates of excise duty on different varieties of alcohol have been modified to the extent of 200 to 300 per cent. For example, excise duty on pure alcohol has been raised from Rs. 4.20 to Rs. 10·30 a litre. This alone will bring in Rs. 215.4 million. Similar modifications have been made in the rates of excise duty on country liquor and beer and with resultant increase in the sales tax because of these modifications, the State finances will be augmented by Rs. 293.4 millioo.

In the Fourth year of the 5th Plan, an outlay of Rs. 6500.7 million has been proposed. The govt. hopes that if the rain gods favour the State, it will be possible to end the Fifth Plan with a total outlay of Rs 27,000 million.

There has been a shift in the structure of industries in Maharashtra during the past 15 years. The importance of textile industry is slowly becoming less and less while the food industries sector is gaining. Chemicals and chemical products, basic metals and alloys, machinery and equipment and electrical equipment are also gaining importance in the industrial field in Maharashtra.

Economic Review

About the economic situation, the State income during 1976-77 was more by 6 per cent as compared to that in 1974-75 at constant prices. At the current prices, it was 74,750 million and Rs. 69,730 million in 1975-76 and 1974-75 respectively. There has been increase in per capita income also from Rs. 1271/- in 1974-75 and Rs. 1330 in 1975-76. The situation on the agricultural front was also satisfactory. The index of agricultural production in the year 1975-76 was more than 9 per cent as compared with that in the previous year. Employment in the organised sector especially in the public sector increased by 17.5 lakh (6 per cent)

Under the employment guarantee scheme, in the first seven months of 1976, employment to the extent of Rs. 757 lakh man-days was provided at a cost of Rs. 233 million as compared with 639 lakh man days and Rs. 152 million in the corresponding period of 1975-76. There has been a similar increase in the industrial Production by about 10 per cent in the first ten months of 1976 which was only 2 per cent in the previous year. According to the information available for 1974-75, Maharashtra is much ahead in the manufacturing sector. In the matter of productive capital and employment, Maharashtra's share is about 20 per cent and in production and value-added it is 25 per cent. The per capita production and value-added in the State was Rs. 1214 and Rs. 294 in 1974-75 as against Rs. 445 and Rs. 104 at the all India level.

Whither Our Universities

Science, Universities and Research in India—*An introductory essay by Dr. M. H. Gopal; Geetha Book House, Mysore,* 1976; **Pages** 72; Rs. 20

CARDINAL NEWMAN appears to have been very much in the mind of the author when he delivered his keynote address to the doctoral students at the University of Mysore in November 1972. The 'encircling gloom' apparently got closer to him with a further self-chosen probe that he had attempted into the possible criteria for ranking universities and assessing the quality of the Faculty research. A distinguished social scientist and a well-known authority on public finance, the author's prayer to the 'kindly light' to lead him on is not merely a familiar quote to ornament the book but also a desparate if sincere bid to focus attention on the prevailing state of affairs of most of our universities, numbering 90 at present.

For a developing country such as India, the proliferation of universities is an unmixed evil. Pressures of the teeming school-leavers, unemployment and the permeation of the baleful influences of the outer society including those of politicians, have transformed our universities into veritable caricatures of their counterparts in the U.S.A. and United Kingdom, whose ideals the author energetically upholds with a lingering nostalgia. It is not surprising, therefore, that he finds conditions at home quite uncongenial to the growth of true scholarship and not altogether satisfying any or all criteria of ranking them in terms of his own conception. These are six in all viz their overall contribution to knowledge, faculty, reputation, continuing the effort, the availability of research opportunities, calibre of students and finally, the overall academic climate-intellectual, moral and social. His treatment is replete with many quotable quotes here.

The author promises a fuller study before long wherein he hopes to deal with the various aspects covered rather briefly in this introductory essay. The value of the present attempt, however, lies in its compact portrayal of a fast degenerating institutional set-up that has hardly any chance of becoming an *academic community* for the reason that "its constituents viz., faculty, students and administration, do not collectively and cooperatively stand by the

Books

declared goals, values, standards and methods." The book has the merit of highlighting the findings of several committee reports and impartial opinions of educationaists, that are, however, seldom read or quoted in public. The author desires to see knowledge grown within the universities and not as he puts it, through the sheer process of "collecting scholars as in regard to the Jawaharlal Nehru University." The analysis of this *locale of scholarship and research* is pertinent in a situation where spurious tendencies have become very strong.

In what is patently a devastating piece of writing which is both readable and informative, the author might have also prescribed the remedies instead of limiting himself to a diagnositic appraisal. One wonders whether the transition from empirica sociology towards a broad humanism is both an intellectual predicament of ageing scholars and an inevitability, or may be, that this is merely the outcome of a subjective sense of impuissance that overcomes any scholar with too broad a perspective that is not unfortunately shared by his junior contemporaries. Viewed either way, this slim book makes its reading quite rewarding to students of current affairs

—**B. N. Nair**

Financial Systems

Financial Structure and Economic Development—(*with special reference to India by ES. Srinivasan; Sterling Publishers Pvt. Ltd. New Delhi; Price Rs.* 40; *Pages* 170.

THE PURSUIT OF economic development at least in its theoretical aspects has fescinated many an Economist. Few however have turned their attention to an enquiry into the nature of relations obtaining between economic or real resource development and financial development. On the face of it, it may look rather naive to assume that one could be materially different from the other particularly as the common notion regarding financial development or development of financial assests is that it is merely the other side of the coin of the economic development. The relationship, however, is more complex than casual and could be remote and less direct under emergent economic situations than warranted by theoretical conditions as suggested by the present study.

In this study, which is connected with the analysis of the financial structure of a developing economy, the author sets out three basic questions: Are there structural changes as quantitative (growth) and qualitative (diversification) in the financial system in the context of economic development ? If there are charges, how are the diffeient aspects such as financial assets, institutions and markets affected by such structural changes and how best can these be analysed and explained? In an attempt to answer these questions a theoritical framework is developed to explain the relationship between development of real factors as income population and technology with the growth of financial assets, institutions and markets. The several hypotheses that the study seeks to test relate to significance of the changes in the financial systems in relation to growth of national income, the emergence of the government sector as the overall deficit sector and one which is most dynamic increase in domestic borrowowings with consequential establishment of special types of financial assets and institutions and flexibility of money and capital markets with growth.

For the analytical work, the study draws heavily from the flow of funds accounts of the Reserve Bank of India (RBI) and the model developed by Prof. R. W. Goldsmith in his book "Financial Structure and

Development", Yale, 1969. The financial transactions restricted to the organised sector covering the period from 1951-52 to 1965-66, are presented in terms of a six sector input table, into which the RBI data have been rearranged to yield important financial ratios asset-wise, sectorwise and for the economy as a whole. The major findings of the study are brought together in the last chapter. To revert to the initial basic questions, the empirical evidence presented here suggests important structural changes both in quantitative and qualitative aspects. The growth and structural changes are seen to be significant in the household and government sectors as also in the banking sector. The financial assets (loans and advances) have increased in relation to national income and this is also clearly brought out by the Financial Inter-relation Ratio (FIR) which shows relation between value of financial assets to the value of all real assets. While both the supply and demand for resources have increased over the period of study, the demand pattern is seen to be more variable than the supply pattern, suggesting increased flexibility of financial markets Yet another conclusion and one with policy significance is that while domestic borrowings and inflation increased over the years self-finance and taxation showed a decline and foreign finance remained either negative or stagnant. These findings are not linked with economic theory. However, an explanation is offered tentatively in terms of economies of scale. For instance, it is observed that the initial efforts of the government to expand the domestic monetised markets through making a larger part of the economy susceptible to money-price system and other measures helped financial specialisation and enabled the financial systems to reap internal and external economies.

Admittedly the analysis suffers from certain limitations such as those arising from the original estimates of the RBI, used in the study, the restrictive aggregation of data in the input-output table which excluded certain 'sources' that could not be distinctively allocated to any sector in particular etc. The savings data drawn from different sources like RBI and the CSO estimates have also introduced an element of incomparability. The usage of a familiar concept like the capital-output ratio differs from the conventional one, alerting the reader to use the statistical measures with certain caution. Nothwithstanding these, Dr. Srinivasan has undertaken a painstaking study which uncovers many areas in the intricate web of financial operations not always clear to the non-finance readers. One would wish that the second period 65-66 to 71-72 which witnessed crucial changes in the structure and growth of the financial systems especially with nationalisation of the commercial banks, was subject to the same rigorous analysis as adopted for the earlier period. Such an extension would have been useful in providing satisfying answers to a few pertinent questions, notably the extent to which growth in direct investments by the financial institutions (other than the nationalised sector) was responsible in diversion of resources to non-priority sectors.

—K.S.V. Sanjeeva Rao

Help Book for Students

Money, Banking, Trade and Finance *by M. S. Rao and S. N. Sen; Published by Premier Book Company, Daryaganj, New Delhi*-110002; 1976 *edition; Pages* 385; *Price Rs* 15.

THIS BOOK is in the form of questions and answers on different topics of the subjects as indicated in its title. As many as 31 chapters have been written for the benefit of undergraduate students of Indian universities.

Most of the questions have been taken from question papers of various university examinatins. The answers are a bit sketchy but they do help a student who does not have the time to read text books and who is motivated to get through the examinations Although such types of books are in plenty in the market, this particular book is a refreshing contrast from the common run. The authors have taken pains in writing the answers and have not sacrificed the quality

Coming as it does from an experienced publisher, the book is an eminently helpful guide to students of commerce and economics for a quick reading before appearing in examinations. It would be right to assume that students who read this book, have some background knowledge from some text-books as well.

—Navin Chandra Joshi

Grass Roots

(*Contd. from Page* 25)

little odds and ends of daily life. She expects to make enough from this source to supplement her husbands' income But there is a catch. A couple of other women are running similar stores and she lacks the capital for the initial investment. "If I had some money, I would give it to my husband to purchase a cycle. This would save us the bus fare at least," she says.

Though the little pleasures of life, like the once-in-a-while movie show, are no longer possible, Shobahi does not regret the move to the city. In her own quiet way she is ambitious and is keen on getting the three children educated. Pointing to some of the brick-and-mortar houses next to hers, she wistfully remarked that she hoped to own one, if not soon, at least when her son grew up and secured a job. For people like her and millions of others the Urban Dream is a reality and this will continue to fire their ambition for a better life.

Development Notes

Indian Power Equipment for Malaysia

Malaysia may purchase more equipment from India and employ her consultantcy services for expansian of power programmes Malaysia had so far imported from India equipment worth Rs 300 million for its thermal plants BHEL has secured an order for supply, erection and commissioning on turn-key basis of three 120 MW boilers and auxiliaries for the Prai Power Station in Malaysia The order is valued at Rs 164 million.

The Malaysian Government was examining a proposal for setting up a switch-sugar plant in Malaysia with assistance from BHEL. Malaysia would also soon be sending a team of experts to India for a feasibility study of the Metal Industries Development Centre to be set up in Ipoh, about 170 miles from Kuala Lumpur

Investment by Indian companies in Malaysia until the end of 1973 was estimated at $ 32 million (about 13 million US dollars) which represented the seventh largest source of foreign capital in the manufacturing sector

Indian Steel Consultancy for Nigeria

The public sector Metallurgical and Engineering Consultants (India) Ltd, has been appointed as consultants to the Nigerian Government for setting up two integrated steel plants each with one-million tonne capacity The plants are to be located at Onne near Port Harcourt and Aladja near Warri Each plant will be based on the direct-reduction process and will have iron ore pelletization and sponge iron making facilities, electric arc furnaces, continuous casting facilities and rolling mills They will be established within five years

Under the contract MECON will provide consultancy services covering all sections of the steel industry upto the stage of commissioning of the plants as well as advice on techno-economic matters. MECON will earn $ 10 million as fees.

REC Sanctions 57 New Projects

The Rural Electrification Corporation (REC) has sanctioned another Rs 181 9 million for 57 new projects for the extension of electricity to rural areas in 13 states These projects which cover 3,387 villages will help energise 19,348 agricultural pumpsets and 1,620 small scale agro-based industries in the rural areas. In addition, the schemes provided for about 47,000 domestic and commercial connections and more than 10,800 street lights With these new projects the total number of electrification schemes approved by the Corporation so far has increased to 1,448

Of the new projects sanctioned by the Corporation at its recent meeting in new Delhi as many as 25 are meant for the socio-economic development of the backward areas A special feature of the new projects is a substantial number of mini schemes sanctioned for the energisation of clusters of irrigation pumpsets in small pockets to give a feature boost to agricultural production in these areas.

India-Made Coke Oven Battery

The first-India made Coke Oven Battery 5A has been inaugurated at Durgapur Steel Plant The 39 ovens of the Battery will have 940 tonnes of coal throughput per day and will considerably step up the gas and coke supply in DSP. The entire design was done by Metallurgical Engineering Consultant of India, Ranchi and the Project was executed by Engineering Project India Ltd. and Hindustan Steel Works Constructions Limited Almost the entire supplies were procured from indigenous sources

Silica bricks meant for this Battery were originally planned to be imported from Japan But the idea had to be abandoned owing to a three-fold increase in their price. At this juncture, indigenous refractory manufacturers came forward and made Silica bricks from indigenous sources thus saving the country Rs 5.4 million in foreign exchange

With the commissioning of this Battery, the coke suppy position of the Plant will improve significantly and cost of fuel, specially towards the use of furnace oil for steel melting will be reduced to a great extent.

Detergent Plant for Andhra

The first joint sector synthetic detergent plant in Andhra Pradesh is being set up by Detergents India Limited at Kodur in Cuddapah district Larsen & Toubro Limited (L & T) is supplying the plant, with a capacity of 5,000 tonnes per annum, for formulation, spray drying and powder handling Niro Atomizer of Denmark is providing the technical know-how for the spray drying plant while the formulation has been developed by L & T's own research and development laboratories at Powai.

Detergen.s India Limited will also manufacture 5,000 tonnes of detergent cakes/bars per year. Civil construction for this Rs 25 million project is in progress

Electronics Complex at Dundahera

The Haryana State Industrial Development Corporation is developing an electronics complex at Dundahera in Gurgaon district. Dundahera is situated at a distance of about 10 kms from Dhaulakuan, close to Palam airport, on the National highway

The complex, spread over an area of 185 acres, shall comprise an electronics functional estate, electronics testing and development laboratory, ancillary units of Industrial Development Projects Ltd, Central Electronics Limited and Bharat Electronics Limited. Industrial Complex forms a part of the National Capital Region and will be a string town of Delhi in due course One noteworthy feature of the complex is that all the industries would be pollution free and smokeless

All essential facilities are being provided here and plots of different sizes have been carved for small and medium scale industries

New Power Project for Haryana

The Haryana Government has finalised an agreement with the Himachal Pradesh Government in a joint Nathpa Jhakri Hydel Project, located 150 kms beyond Simla on river Sutlej, upstream of Rampur Bushir in Himachal Pradesh The project will cost Rs 271 crores The cost of transmission lines will be Rs 100 crores It will have an installed capacity of 1020 megawatts Energy generation in a mean year will be 5300 million Kwh

The project involves construction of a gravity type concrete diversion dam on river Sutlej, near village Nathpa and construction of tunnels and an underground power house.

Under the proposed agreement the project will be jointly owned by Haryana and Himachal Governments in the ratio of 80 : 20 per cent and its capital cost will be borne by the two State Governments in the above ratio. The Haryana Government will bear the entire cost of transmission lines to carry its share of power. Haryana Government will have the exclusive rights to utilise 80 per cent of the power generated.

Work on the project will start soon and will be completed in eight years

Tailings Dam at Kudremukh

Work on the Rs 80 million Lakhya dam, to contain ore tailings of the giant Kudremukh Iron Ore Project, got off to a good start with the first sod turning at site, ahead of schedule.

The 670-metre long and 66 metre high dam across the Lakhya, a tributary of the Bhadra, is the first of the two large earthen dams aimed at preventing pollution of the waters of the Bhadra. This involves 30 lakh cubic metrs of earth work and a storage capacity of 118 million cubic metres. The dam will cover a reservoir over three million square metres, storing tailings of the ore rejects, after the iron ore is concentrated. Huge silt deposits of tailings will settle in this reservoir, preventing the impurities getting into the Bhadra.

Each year 22.6 million tonnes of ore will be mined, of which 7.5 million tonnes of concentrate, with an average iron content of about 66 per cent, will be beneficiated and pumped to Mangalore through a 70-km pipeline, as slurry.

The Lakhya Dam will store about 13 million tonnes of tailings per year. From Mangalore the iron ore concentrate will leave in special ships for Iran. The target date for shipment is September, 1980.

Kerala Newsprint Mill

The Rs 100 crore Kerala newsprint mill in the public sector at Velloor, about 40 km from Cochin would go into production in October, 1978, as scheduled. The mill would produce per annum 80,000 tonnes of white high quality newsprint, as good as the imported variety.

The Kerala newsprint factory is unique as it would be using, for the first time in the world, hardwood as the main raw material. There is also provision for expansion or doubling the production capacity subject to the availability of the raw materials. West Germany had provided 30 million marks (Rs 10 crore) as long term loan for the purchase of a paper machine from that country and mechanical pulp plant would come from Sweden. The chemical pulp plant and boiler equipment would be indigenously fabricated.

Power Generation Improves in U.P.

The second unit of 110 mw capacity Panki Thermal Station in Uttar Pradesh will be commissioned soon. Two units of 55 mw each are under commissioning trials in Harduaganj power station. Over the last two years, there has been significant improvement in the power position in the State. The installed capacity has been increased from 1,674 mw in 1973 to 2,379 mw in January 1977, an increase of 705 mw. Similarly, energy available from all sources improved from about 20 million kwh per day (average) in 1973-74 to about 34 million kwh per day in 1976-77. A maximum of 37 million kwh was reached January this year.

Investment in the power sector during the current year was Rs 231 crore. New schemes like Tehri Dam Project, which ultimately will have an installed capacity of 1,800 mw, and Lakhwar Vyas Reservoir Scheme of 460 mw, have been taken up. In addition, work on Vishnu Prayag (262 mw), Pala Maneri, (204 mw), Maneri Bhali Stage Two (156 mw) have been included in the programme for 1977-78. Two Central Stations Narora Atomic Station (460 mw) and Singrauli Super Thermal Station 2,000 mw- are also under construction.

Sizable Increase in Exports to USA

India's export to the United States touched $710.2 million last year, registering an increase of 20.5 per cent over those during 1975. Imports from the US, however, declined to 12 per cent to $1,134.7 million. India's trade deficit with the US thus came down to $424.5 million, in 1976 from $741.5 million in the previous year. The two-way trade between the two countries increased slightly by about 0.38 per cent to $1,844.9 million in 1976 over that in 1975. Notable performance among exports, was in ready-made garments and accessories. These fetched $79 million against $69 during the previous year.

Exports of other commodities, which registered considerable increase are iron and steel bars and wares (121 per cent), sugar (114 per cent), marine products, including frog meat (98 per cent), leather and leather manufactures (80 per cent), hand and machine tools (54 per cent), metal working machines and machine tools (35 per cent) and diamonds, jewellery and other gem stones (70 per cent).

Fisheries Development in NE Region

Two investigation schemes have been initiated by the North Eastern Council in its efforts to exploit fully the economic potential of fisheries in the North Eastern Region.

Under one scheme it is proposed to have an in-depth study of the Hydrobiological conditions of water bodies which retard the development of fisheries. The study is expected to evolve remedial measures for minimising fish seed mortality and for promoting growth of fish in water bodies. The study, to be conducted by the North Eastern Hill University, will at present cover Meghalaya and Nagaland.

The second scheme is for a scientific study of Orbost lakhs or beals, in Assam in order to determine and augment their utility for fish culture. The study, to be conducted by the Zoology Department of the Gauhati University, will seek to find out ways and means for the improvement of the productive fishery bed of Assam in a commercial scale.

The findings of the study will have relevance to utilisation of similar water bodies in Manipur and Tripura.

Of the earlier schemes for fisheries development initiated by NEC, the Regional Fish Seed Breeding Farm at Kumarghat in Tripura, set up last year has already gone into production and the expansion of Fisheries Institute at Joysagar in Assam is under implementation.

India's First Electric Trolley Bus

The Electric Trolley Bus, designed and manufactured for the first time in India at BHEL Bhopal, has passed the trial run at Calcutta. Calcutta Metropolitan Development Authority (CMDA) is likely to get considerable assistance from World Bank for introducing trolley bus on a fairly large scale. There are also indications [illegible] some metropolitan cities in India are giving thought to [illegible] mode of transport. This would be an entirely new line [illegible] manufacture of equipment at BHEL-Bhopal on a large scale and would help resist the hike in oil prices and conserve foreign exchange.

The bus has a capacity to carry 54 passengers. Its maximum speed is about 40 kms per hour. The body is streamlined and elegant and fitted with foam rubber cushion seats and also three ventilating fans for passengers' comfort. Control gear equipment for the bus, such as controller, resistors, switch group frame etc. were specially designed and manufactured at Bhopal.

Hotels for Tourists

As may as 69 hotel projects, approved by the Department of Tourism, are in various stages of construction to cater to the increased flow of tourist traffic. On completion, these hotels will add another 5,800 rooms to the existing accommodation. The new projects, which are in the private sector, include 18 hotels in the northern region, six in the eastern region, 13 in the western region and 32 in the southern region. Hyderabad, with 11 hotel projects, tops the list, six new hotels are to be constructed in Madras, five each in Delhi and Bombay, four in Varanasi and three each in Patna and Bangalore.

With a view to encouraging hotel construction in the private sector, a provision of Rs 10.2 crores has been made in the Fifth Plan for grant of loans through the Industrial Finance Corporation of India. During 1976 loans amounting to Rs 1.96 crores for eight hotel projects were sanctioned.

More Roads for Northern Border

The Centre has given its approval to the construction and improvement of 854 km of road at a cost of Rs 28 crores in the remote areas of nothern and north-eastern border. The programme already included in the final Fifth Plan involves new construction of 625 km and improvement to 219 km of roads. The special border area programme will cover Jammu and Kashmir, Himachal Pradesh, Uttar Pradesh, Assam, Arunachal, Meghalaya, Mizoram, Nagaland, Manipur and Tripura. The Border Road Development Board will execute the work, but the entire expenditure will be borne by the Union Government. The programme will help the economic development in the remote areas and bring about more social cohesion among the people living in the hilly regions.

One of the most important new roads will be the Sansari-Killar - Pangi - Thirot road covering a length of 117 km in Himachal Pradesh. The cost of construction on the project is estimated at Rs 3.75 crores.

New Handicraft Centres

The Handicrafts and Handloom Export Corporation and the All-India Handicrafts Board are planning to start another 365 centres this year to create work force of some 30,000 weavers by the end of the Fifth plan. This follows the unprecedented response by over 200 training centres started by the government last year to provide skilled manpower for the growing carpet export industry. Carpet exports from the country picked up enormously in the past few years rising from a mere Rs 11.69 crores in 1969-70 to Rs 41.43 crores last year. Exports of handwoven carpets from the country this year is likely to exceed Rs 50 crores.

DEVELOPMENT AND TOTAL REVOLUTION

No philosophy of development which has relevance to a country like India with a backlog of centuries can be credibly pragmatic if it did not postulate the urgency for a new value system. With so much to catch up and so much to do away with, a vast and complex nation like India cannot think of a half-way house to progress. In Shri Jaiprakash Narayan's recent message to the nation there is a confirmation of the basic social and ethical values without which all developmental efforts would become a mockery, with the price having to be paid by the whole country in the form of incompetence, corruption and wastage of the nation's limited resources.

In every sense it is the people who make or mar their own future and what J.P. appealed for is a conscious and deliberate appraisal of what is good in our heritage and what is obviously worthy of rejection. Into this category fall several social customs which people in thier ignorance cling to and pay a heavy price in the form of individual suffering and apathy for social good. JP's emphasis was on the concept of people's involvement in democracy which should not be confined to the periodical ritual of electing their legislators but result in constant vigilance on the functioning of institutions and the behaviour of men in authority.

Obviously this concept cannot have any meaning to the people if it were not to influence and canalise the immense potential of the country for its betterment. The process of development since the last 30 years has been guided in a manner that places governmental authority above local initiative. Local initiative in harnessing local resources for solving urgently felt local problems has rarely been in evidence. Whatever the benefits of the Plans—and there are indeed many—have reached the people but slowly and grudgingly and allocation priorities have often been decided on arbitrary or doctrinnaire considerations.

This point perhaps needs some elaboration. For example it would be difficult to answer the question why, after 30 years of planning, we are still unable to supply protected drinking water to more than 60 per cent of our people. Go to any villager and ask for his frank opinion on how planning can benefit him.In most cases he will mention water for irrigation as priority number one, with roads, electricity and hospitals coming next in that order. His is a sensible observation, however illiterate he may be. That we need cement, oil, fertilizers, steel, and heavy machinery of our own make is beyond doubt. But the villagers would like to ask some fundamental questions even if they appear to be naive. He would like to know why the politician should have the last word on what the field engineer has to say. He also wishes to know where exactly the grass roots of our planning process lie, for he is not quite sure if agriculture, land reforms, transport, housing and public health have peen accorded the importance they deserve. The monitoring system has its deficiencies and institutionalised reporting is far too inadequate to provide the feed back that the planner and the administratior so badly need to make the development process a facet of functioning democracy,

There have been encouraging hints from the new Government that there would be a second look at the 5th Plan, even though it is in its final stages of implementation. Whatever the results of this exercise might be, the country has the satisfaction that the newly elected Government will not hestitate to make radical changes in the working of institutions charged with development efforts. India has an immense man-power which is going unutilised.

Formal education in schools and colleges has only helped to swell the ranks of educated unemployed. We have not harnessed more than about a quarter of our water potential for irrigation and we are caught up in nightmarish Inter-State disputes on the sharing of river waters. We have immense hydel potenial as yet untapped in the Himalayan and sub-Himalayan regions, yet we are far from enunciating a national policy on their exploitation. The Government alone with its resources will be unable to take on the development of all the resources simultaneously. But the answer to this, as yet unsolved problem, is to involve the immense manpower in the countryside in democratic development that will ensure local initiative and harnessing of local resources so that living conditions become a shade better. The task is not easy because it involves a total revolution. The Government can be an effective catalytic agent in transforming the countryside but it must consciously encourage honest and well-meaning efforts at village levels for self-betterment. This is possible only when the image of the entire administrative machinery is refurbished to eradicate political corruption and enthrone local leadership. Clearly defined duties must go with clearly demarcated resources and authority. Now India has need to reaffirm old and well-tried truths. Three cheers to democracy!

The present planning strategy is to concentrate investments in urban areas with the result that only a small minority is enjoying the benefits. Rural areas where 80 percent of population lives is starved of resources. Thus the gap in the level of income is widening and unless this process of lopsided development is reversed, there is hardly any scope of improvement in the employment situation says

Dr. RABINDRA NATH

The Strategy for Planning

THE PRIME MINISTER has called for a revision of the Fifth Five Year Plan which is urgently needed. The planning is at a cross road today Industrial progress is hardly encouraging. Unemployment has raised its ugly head. The distribution of income is lopsided The poverty line is continuously going up. Today we can easily put fifty per cent of the population under this line. An increase of nearly 12 per cent in prices during the last one year is creating again disequilibrium in the economy and it is the poor who are suffering most on this account.

The fundamental question arises why this disequilibrium has been allowed to develop to criple the economy. If we go back to two decades of planning, we find that during the first decade, the rate of growth of agriculture was 3 6 per cent per annum. During the second decade of planning, the rate of growth of agriculture and industry had fallen to 1·6 per cent and 3·5 per cent respectively. While the growth rate of services was 6·0 per cent per annum.

This situation has developed during the second decade of planning due to the set thinking about the feasibility of taking up defence and development at the same time. It is easy to say that there are resources sufficient to look after defence and development. But it can be seen from 1962 onward when we started diverting resources to defence that the economy started developing strains. After the war of 1965, the situation became much more severe and after 1971 war, the economy had completely gone out of gear It is beyond doubt that the economic crisis of today is the result of disproportionate expansion of publio expenditure to the overall production.

Dr. Rabindranath is Senior Research Officer, Planning Commission

There is unwarranted alarming increase in the non-planned expenditure, which includes expenditure on defence and administration In the present circumstances the economy is finding it difficult to bear the increase in non-plan expenditure on defence as well as on administration and there is need to effect economy on both items

It would have been much better for the planners to curtail the outlay of the plans instead of going for deficit financing In that case, our rate of growth would have been projected on a lower key but the planning process would not have faced a stagnation during 1965-75

In the planning process good amount of investment have gone in industry as well as in agriculture But the returns which we are getting from these investments are too low. During the last decade the performace of industry was much sluggish and about 50 to 60 per cent of the capacity was utilised. In such a situation the foremost emphasis should be laid on the full utilization of capacity. There is no use in establishing more and more capacity whch remains unproductive. We are unable to supply power and raw material to even present established capacity in industry. Further, the development of industry has taken place in such a way that the fruits of development have gone to a privilege delite and if we go on emphasising on industrialisation on the present pattern, the improverished masses would go on expanding.

At present, there is an urgent need for decentralisation of production process to create employment opportunities for regional talent. With the emphasis on industrialisation, the village is ignored and if the same policies are continued, village will not get proper attention in the development process even in future. We cannot ignore 80 per cent of the population living in villages nor can we afford their migration to the cities. Even at present, city life is at its worst. With the development of industrialisation, slums have sprung up in all the cities. Now is the time to give village its due and stop migration from villages to cities failing which life in cities would become unbearable.

The best alternative lies in developing agriculture and village and small scale industries. Greater emphasis may be placed on the development of animal husbandry, forestry coupled with agro-industries. Side by side, there should be development of soil and water conservation to improve the fertity of the land. The whole development work in rural areas should be based on certain principles. The principles called for programmes based on local resources, help the people with intimate expert counsel, involve the whole community irrespective of their socio-economic status, plan for diversified economic activities and concerntrate on quality rather than on quantity.

The foremost task of planners is to provide food, clothing, housing, services and social security, employment and education to break the chain of misery. Industrialisation increases productivity no doubt but it starts with the assumption that the production factor 'labour' is in short supply than 'capital'. But with us, the position is the other way round. We are short of capital while production factor 'labour' is in abundance To establish industry with heavy capital per worker needs huge capital resources. In the present situation, greater emphasis on industry would result in jobless millions which is likely to upset the present social set up. The present production pattern provides consumer goods only for the minority at the expense of majo-

would only perpetuate the present production set up. In the field of agriculture, traditional farming methods require much less capital Here, the yield can be improved either by putting more capital or by more labour. We should try to improve the yield by making agriculture labour intensive. In the field of high yielding varieties, development should be carried out in such a way that greater number of persons work more productively with minimum amount of capital. This can be made possible by increasing the use of organic manure and with the introduction of multiple cropping system. The labour intensive efficient agriculture system depends upon the development of irrigation system, roads, credit facilities, and storing facilities for the farmers. The farmers also need basic education and minimum health services. By developing the required infra-structure, we can help small farmers to have a satisfactory existence in the village.

National interests have to be kept in view while planning. It is necessary to bring the lowest 30 per cent of population upto standard consumption. Therefore, this 30 per cent have to be brought up to the level of the next quartile as quickly as possible. All resources have to be developed and utilised subject to the priority to the criterion. Since the rate of development in prosperous districts is high there should be a policy where such rates of gowth are curtailed so that thé resources are diverted from prosperous areas to backward areas. Social justice and growth demand such diversion. Political pressures has to be avoided to achieve these results. Otherwise, permanent inequalities would be generated and whole purpose of planning would end in failure.

At present, there are differences over priorities which need to be protected from adhocism. Physical achievement and efficiency have been sacrificed in favour of financial evaluation. Some of the parameter have undoubtly changed and an element of distortion introduced in the forecast by external factors. But basically public confidence has been shattered by the government's present policies. Though we have invested huge sums in agriculture, yet we imported 12 million tonnes of foodgrains during the first Plan, 17 million tonnes during the second, 26 million tonnes during the third plan, 13 million tonnes during the 4th Plan and 5 million tnnes in the first year of the Fifth Plant. We are unable to shed idological cobwebs and consider it much better to import crores of rupees worth of fertilizers than permit foreigners to set up factories.

The country would like to see evidence of zeal on the part of Central and State Government to implement the reforms already in the statute book and pluck loopholes that have permitted widespread evasion. Even so basic and obvious a task as the preparation of an accurate and up-to-date records of rights have not been completed over large parts of the country. Time bound programme to accomplish this task hav been solemnly announced periodically, tongue in check the official policy in this regard apparently being to say the right thing and then deliberately do nothing. In 1973, a Task Force appointed by the Planning Commission under the leadership of the Land Reform Commissioner made his scathing report bluntly attributing the failure of agriculture reform to lack of political will. This is a problem which has become more pressing with the passage of time

At present, we have created highly sophisticated capital intensive and capitalistic industrial sector on a premitive and traditional agriculture sector incapable of supporting the additional demand created by the large investment in the industrial sector. If we have tried first to usher in land reforms making the tenant rightful owner of land and then pumping in larger amounts of capital to modernise the agriculture sector and to build up the necessary institutional frame-work such as services, centres cooperatives etc. and then use the additional investible surplus generated by the agriculture sector to build up the industrial base giving priorities to agro-industries and basic industries we could have averted the economic disaster facing the country In the present circumstances, the following measures assume much importance:

1 Vigorously implement land reforms, intensify research on dry farming, take steps to collectivise the farming on uneconomic holdings and increase production of agriculture inputs, particularly non-labour saving chemicals inputs such as fertilisers, pesticides etc.

2. Constitute an army from unemployed able bodied persons who could concentrate on soil conservation, land reclamation, extensive work, digging of wells, population control etc.

3. Divert the production of essential raw materials such as steel and cement which would remain surplus to agricultural sector for building dams, bridges, storage facilities etc.

4. Since the stagnation in industrial sector would deprive the government of substantial revenue, it should introduce different rates of corporate taxation whereby industries manufacturing luxury goods such as air conditioners, referigerators, toothpaste, chocolates, liquor etc. would have to pay substantially higher rate o taxes (80 to 90 per cent of the profits). This would not only ensure increase in revenue to the government but also reduce the consumption and divert the investment to the manufacturer of essential commodities.

The present restrictive monetary policy has already paid good dividends. To check inflation, it is of utmost importance, that no relaxation should be brought about in this policy. It is the availability of cheap credit which has damaged the economy considerably. At present the corporate sector is collecting deposits from the public. In this way, they are circumventing the restriction imposed on the availability of credit. And immediate action is required to stop the Corporate sector from collecting unlimited public deposits.

Past experience in this country has shown that mere materialistic approach to development strategies will not bring out any radical transformation in the conditions of the poor. The bemoaned optimism to achieve targets without inducting the much needed socio-cultural ingredients in the system will remain a far cry. What is needed is action packed result oriented development programmes to be implemented on a consistent basis. So long as the farmers are deprived of an efficient support mechanism backed by price incentives, motivating them to produce more it will not have the desired impact.

Unemployment

The problem of unemployment is bedeviling any solution. The country had 3 3 million unemployed at the beginning of the First Plan. The number of unemployed increased to 5.3 million at the end of the Plan. But the planners did not think of correcting the structural defect of planning priorities with the result that the number of unemployed want upto 9 million jumping to 11.5 million by the end of the Third Plan. The Planners thought to reduce unemployment by not specifying the number of unemploed in the body

(Contd· on page 37)

MASSIVE PROFITS TO SUPPLIERS

THE DECEIT OF

FOR THE PAST 30 years, for as long as the United Nations has existed, international conferences have succeeded each other with monotonous regularity Every so often, one of them is hailed as historic, like the special session of the United Nations General Assembly in April 1974 on raw material and development. Other examples are the various UNCTAD meetings, although the latest, in Nairobi, was no longer able to to sustain the illusion. Nothing constructive has so far emerged from all the brilliant rhetoric of these abortive gatherings The initial shock of the capitalist world, faced in the middle of a recession with the revolt of the oil-producing countries, has, since 1975, given way to a renewed determination to regain the offensive, not only in terms of economic recovery at home but also in order to recapture control of world markets. According to the 1975-76 annual report of the General Agreement on Tariffs and Trade (GATT), "the value of exports from industrial countries rose by seven per cent (in 1975), mainly due to a 60 per cent increase (compared with almost 80 per cent in 1974) in sales to the oil-producing countries". In other words, the industrial nations have managed to turn to their own advantage the sudden acquisition of wealth on the part of their trading partners.

This, of course, is the reason for the failure of UNCTAD initiatives and the North-South dialogue: if the world economy is based on nothing but commercialism, all the fine theories are bound to come to grief when confronted with the powerful interest of the trading countries of the North. With a monopoly on saleable goods (even oil would not sell without the profits expected from its by-products) the industrial powers have complete control over world trade. It has become altruism to say that not only goods but also transport, credit and the entire commercial system are in the hands of the rich.

ennial background to international relations in order to place in historical perspective the futility of negotiations based on even the remotest hope of concessions from the industrial nations What is more serious is that it throws into relief the inherent limitations of those sudden outbursts of aggression on the part of countries which produce raw materials, whether it be by raising the price of crude oil or nationalizing foreign firms. In both cases the lack of communication between North and South has shown beyond a doubt that economic relations are still governed by commerce alone

Sales—that is the magic word, the universal law which is everywhere condemned and everywhere applied The result is another cliche, the sole objective of internatonal co-operation for development is to find additional markets for the lending countries Evidence of this is the fact that for the past 30 years the loans granted by the "haves" to the "have-nots" for purposes of development have been tied—in other words made conditional upon more or less compulsory purchases from the countries which grant them In view of the fact that 65 per cent of the "aid and credit for development" allocated to the developing countries is in the form of loans, it is easy to understand why the North-South dialogue has foundered on the chronic and increasing burden of debt assumed by the countries supposed to benefit. Even more significant is the fact that multilateral —presumably not tied—financing accounts for only 16 per cent (1974 figures) of the loans. Clearly the Third World is caught in a vicious circle: loans with strings attached have become established practice.

System takes over

From the moment development projects are first conceived, the system takes over; the lending countries, eager for markets, vie with each other in making generous offers in the name of international co-operation. Obviously, when a European country makes loans to Third World customers, it does not insist on its of criteria which only its own firms are in a position to meet. The research and development departments are expected to ensure that the technical plans coincide with the capacity of the parent companies who will do the building or provide the equipment.

The fashion for turn-key contracts for factories has only served to strengthen the system. The engineering companies offer a package deal covering the entire process from initial technological research to handling over a fully-staffed factory, including drawing up plans, buying equipment, supervising building work and training personnel.

No one is any longer deceived by the conjuring tricks of the lending countries, but the loans are in fact accompanied by credit facilities which at first sight appear extremely attractive: longer repayment periods apparently reasonable interest rates, quicker and easier administrative formalities. Even before the contracts are signed , French, Germans, Russians (they do the same thing) or Americans obtain a guarantee for the future. The loans provide parent companies with almost boundless conracts not only for supplies and construction but also for technology and technicians, maintenance and expansion

Inflated prices

As if trying to propitiate the goods, international gatherings are loud in their denunciations of fraud. Little good this does, since it is the aid to development itself which is deceptive There are no loans for developing countries but only export subsidies for the lenders themselves. Whatever they may be called, loans to the Third World are aimed solely at encouraging the exports of the countries which make them. What this means is that development aid is good business; tied loans ensure that markets are guaranteed in advance, trade risks are automatically eliminated by the lack of competition and financial risks are non-existent since it is the countries of the parent companies which pay. In

TIED AID

SENNEN ANDRIAMIRADO
Economic journalist from Madagascar

goods but also fix the prices for them.

In the 1960s, Dr Mahbub Ul Haq, then Head of the Pakistani Planning Commission, made a fully documented denunciation of the exaggerated profits made at the expense of the Third World by the providers of tied loans. Referring only to goods of equal quality, he showed that France, for example, was selling railway engines and track to Pakistan at a price which was 87 per cent higher than that offered by the Germans, Japanese, Danes or Czechs; Japan was lending money to Pakistan in order to sell rice mills which were 120 per cent dearer than those which Germany could have supplied; the United States was selling railway carriage wheels which were 147 per cent more expensive than those offered by Japan; and France was selling ventilation pipes 392 per cent dearer than the Japanese article.

Avoiding the pitfalls

Examples are legion and occasionally surprising. According to a confidential report of the World Health Organisation (WHO), India is still buying vitamin C from the United States at $10 kilo whereas it could obtain it elsewhere at $2.40 a kilo The fact that India is seeking aid means that it must pay the full price. This is what is known as aid to development. Caught between the governments of the rich countries and the economic operators who are the real decision-makers, the developing countries are more or less obliged to accept conditions of this kind.

At this point it becomes possible to assert that the more credit is provided for development, the more the lending countries benefit by the boost given to their exports, This statement, which those who are seeking to maintain their illusions may describe as cynical, leads on to a question. Is there no way for the Third World to avoid the pitfall of loans from countries which are first and foremost traders? The question has many replies.

One is a political decision which currently seems only to have been adopted by Cambodia, as it was in the past by China and North Korea—almost complete isolation from the international trade system. A basic structural limitation prevents the majority of Third World countries from following this path: the bourgeois character of the ruling masses who often have connexions with international capitalism rules out any economic policy not based on trade. Whatever the declarations of intent, the development models adopted by the Third World are still essentially capitalist, if not imperialist insofar as they follow the pattern of the prevailing economic system of the industrial and commercial nations.

Seeking strength

A second answer would be to aim at a fundamental transformation of the international economy. This is the attempt which is being made at the moment by means of guerrilla warfare on an international scale. harrassing tactics using oil as a weapon, continual revolt by the producers of raw materials, maintenance of a permanent atmosphere of economic insecurity. The trouble is that these weapons are not inexhaustible and coffee from Colombia or vanilla from Madagascar hardly have the same striking force as Saudi Arabian oil.

What the Third World is seeking is to strengthen trade between developing countries This new plan of attack, launched (or rather re-launched) at Colombo in August 1976 by the non-aligned countries, has already been put into operation in the form of decisions taken at the economic meeting of the Group of 77 in Mexico in September 1976. In the long term, it might prove a threat to the present trading nations whose true Achilles heel is their commercial interests. Because it is idealist and because it tackles the problem of international economic relations at the source, this solution is probably the most desirable. The new international economic order is based on the search for a structural transformation of this kind. But success is a long way off—Rome was not built in a day.

A secret weapon

In the short term, therefore, it seems necessary to find specific solutions within the framework of the existing rules governing the world economy. Such, at least, is the answer proposed by the Peruvian economist, Hernando de Soto. His idea is simple if only the rules of the market economy were applied, the Third World could already have revolutionized international trade. What this means is that because all the lending countries adopt the system of tied loans, the developing countries could force them to complete with each other.

A piecemeal solution insofar as it applies to projects undertaken individually, this approach is nevertheless attractive. It exploits the commercial instincts of the industrial countries in order to undermine their oligopoly in terms of the Third World markets. Hernando de Soto's secret weapon is to make available to the developing countries an information centre which will provide on a comparative basis the necessary data for choosing associates. Although the industrial exporting countries have their own information services, so far there has been a major gap in information available to the Third World: no publication or organization provides comparative documentation on the financial, commercial and technical conditions which the potential associates are in a position to offer.

As long as the international economy remains based on market considerations, in an exclusively commercial arena dominated by trading powers, competition would seem to be the most immediately effective choice of weapon Strenthening trade within the Third World is a step in the same direction: in the long term it would upset the arrogant self-assurance of the trading nations. Then would be the time to resume the North-South dialogue. ☐

Correction :

In our issue dated 1-14 April 1977 on pages 7 and 9 pleas read Janata Party in place of BLD.

A MEMORABLE YEAR FOR REGIONAL RESEARCH LABORATORY-

THE YEAR 1976 has been a memorable one for the Regional Research Laboratory Jammu. One of the four multi-purpose units of the Union Council of Scientific and Industrial Research, the laboratory with its know-how and technology has associated itself with many important projects in operation in various parts of the country It has now started venturing outside the country too.

The most adventurous activity of the laboratory relates to the extraction of borax and sulphur in Ladakh for which the machinery was also designed, fabricated and installed by the laboratory technicians themselves. Its other works include development of a solar dryer for scientific dehydration of apricots of Ladakh, establishment of a factory for packing cases from pine needles, development of technical know-how for indigenous furs and suede leather from locally available sheep and goat skins Its method for processing citric acid, an important industrial material, has also reached a much advanced stage.

Borax is a strategic material, extensively used in many industrial products, pharmaceuticals, glass, and ceramics Presently it is entirely imported involving considerable foreign exchange It is found in India only in Ladakh in Puga valley at an altitude of over 4500 metrs. The Regional Research Laboratory (RRL) Jammu successfully evolved a process for extracting refined borax from the crude material obtained from surface encrustations and also devised and installed a machinery right in Puga valley using the geothermal energy available there. Incidentally this is the first use of geothermal energry in India. In 1976 the laboratory handed over the machinery and know-how to J. & K. Minerrals Ltd, a J & K Governement public sector enterprise. Very recently the capacity of the machinery has been increased from processing one tonne of crude borax daily to five tonnes

Moreover, RRL has now developed know-how for making boric acid based on this indigenous raw material Large scale trials have been successfully completed and the process is being released for commercial exploitation

Similarly RRL has also designed and installed machinery for extraction of sulphur from surface deposits in Ladakh in Puga valley. The work is being scaled up gradually to reach the stage of commercial exploitation. Sulphur is a strategic material It is used in th manufacture of sulphuric acid whic has wide range of industrial use It was also being wholly importe till now.

Ladakh produces about 150 tonne of apricots annually but their me thod of drying is crude resulting i low variety of apricots which ar unhygienic, too The process more over, takes a long time Takin advantage of the intense heat an fast winds during the day in Ladakh the RRL has developed a sola dryer which is much faster, mor hygienic and results in high grad of dried apricots The equipmen is simple to use and its constructio is so simple that it can be fabricat ed even by village artisans themselve

Thousands of tonnes of pin needles go waste in jungles Th RRL has evolved a process for mak

SURAJ SARAF

JAMMU

ing packing cases for apples out of them. On account of large export of apples both from J&K and Himachal Pradesh hitherto huge quantities of valuable wood were being used for making these packing cases. RRL has already established a factory for making packing cases from pine needles for Himachal Pradesh government. The fibre-boards made from pine needles, used in the manufacture of packing cases, can also be used for walls, ceilings, panels, air bags, picture frames etc.

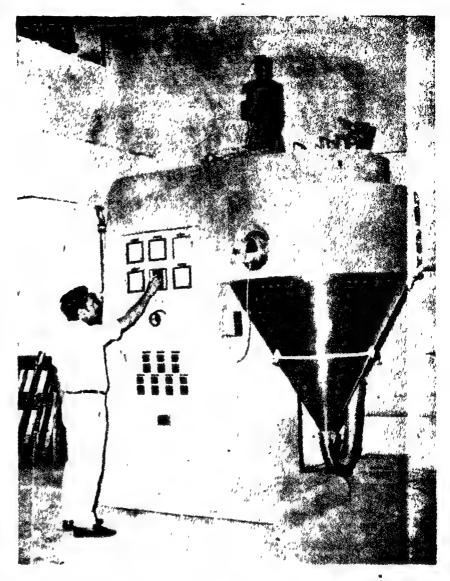
The laboratory has also made pine wool out of pine needles. It is used as stuffing material and for thermal insulation. There is scope for its use in rubber foam also. The process has already been released to some firms for commercial production. RRL has also worked out processes for the conversion of rice straw and other industrial wastes into boards.

Fur and Suede Leather

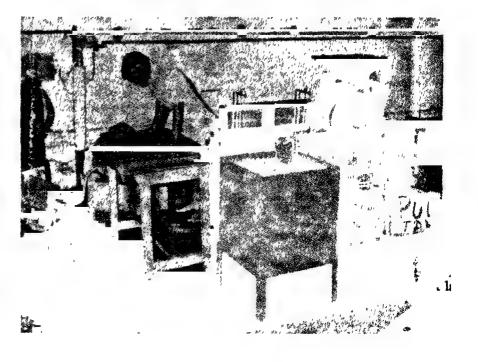
Fur industry of J & K, which is the only industry of its kind in the whole of country, was facing acute shortage of conventional fur skins from wild sources. The RRL, therefore, searched for a process for converting locally available sheep and goat skins into furs and suedes and successfully found it.

To carry out this important job a full-fledged Fur and Wool Technology Block with modern equipment had been set up by the laboratory about a year and a half back.

Drugs

The RRL is also working on several drugs to save country considerable amount of foreign exchange. Most important current project in hand is that of scoparone obtained from artemesia a com-


Spray Drier which converts solutions into concentrates to yield powdered material

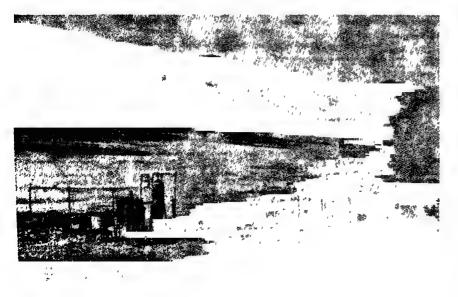
Hand-made cardboard unit in operation in RRL, Jammu.


mon shrub available in Jammu region. It has a marked hypotensive and tranquilizing property. After the successful experiments carried on over the past four years on animals, the Drug Controller of India has now permitted the RRL to experiment with it on human beings in two hospitals in the country viz Medical Hospital, Jammu, and Seth G S. Medical College, Bombay. Process for isolation, synthesis and assay of the drug has been worked out by the organic chemistry division of the RRL and pharmacological studies have been completed by the Pharmacological Division.

The laboratory is also working on Vasicine, an alkaloid of Adhatoda Vasica (Vasaka) It is a potent uterine stimulant and abortificient. The process for the isolation of vasicine and the preparation of its hydrochloride has been worked out.

The laboratory has also evolved a process for manufacture of progesterone, an important female sex hormone, which is widely used as a remedy for irregularity of menstrual cycle, and in maintenance of pregnancy. The hormone is also used in controlling habitual abortions in cattle and other animals.

Progesterone is a costly drug which was being imported. The process developed by RRL is facile and employs only the indigeneously available solvents, chemicals and equipment.

The starting material for progesterone is diosgenin which was being obtained from the plant dioscorea growing wildly in higher altitudes in western Himalayas But due to its over-exploitation its availability is fast decreasing. However, RRL has sought an alternative source for this active agent It has found that plant costus speciosus is an ideal supplementary source for diosgenin. Costus speciosus grows wildly throughout the foothills. Moreover, RRL has successfully cultivated it and found that it can grow under different agro-climatic conditions In addition to that RRL has also found that plant Solanum khasianum yields an active solasidine content which is analogue of diosgenin. This plant can be cultivated throughout the country The laboratory has also evolved a special strain of this plant which yields larger quantities of the active agent viz 2.5 to 3 per cent as compared to only 0.8 to 1.7 per cent in the wildly growing plant.


RRL has also processed a non toxic food protectant with high efficiency After a large scale screening of plants carried out by the laboratory it discovered that the vapour and oil of Acorus calamus, which grows throughout the country as a weed and is being used in indigenous system of medicine, can effectively control rice weevil, pulse beetle, red flour beetle as also furniture/carpet beetle and the fire bert. It is specially useful in Indian conditions because our farmers having small living quarters cannot use poisonous fumigants and being ignorant cannot use insecticides either, as they have obnoxious smells, contaminate food and are also toxic to human beings and other animals.

Citric Acid

Citric acid is an important organic acid found naturally in citrus fruits Till now it was being manufactured by a few multinational companies in the world. It is such a tricky and complicated process that most of the manufacturers take 20 to 25 years of extensive R&D work to develop it. A number of companies after spending millions of dollar on R&D for this process meet with failure due to the very complicated nature of the process. Those who succeed in evolving the process keep it a closely guarded secret

Indian imports of citric acid at present amount to about rupees one crore annually They are likely to double in the next few years due to its uses in industry.

RRL has successfully developed a very versatile and potent microbial culture, for avoiding any pitfalls in the industrial production of citric acid. The stability and potency of this culture have been fully established and its proper maintenance to keep it in active form have also been worked out. RRL has also worked out a suitable medium to obtain its maximum yield and cane juice has also been worked out as an alternative raw material for direct fermentation of citric acid.

After obtaining success with 500 litre capacity citric acid fermenteters the RRL has now taken up, the manufacture of 4000 litre fermenters. This step has been taken up as an intermediary step to 25,000 litre capacity batches for full commercial exploitation. It is note-

Urban Land Ceiling Act 1976

—MAHABALESHWAR NATH MORJ

AN INSTRUMENT FOR DISTRIBUTION OF WEALTH AND PROPERTY

THE concept of the property right is changing all over the world Article 31 of the Constitution of India refers to the right of property. The right to property a fundamental right conferred by Article 31 has since been modified four times by the amendments in the Constitution The Supreme Court of India held in the Golaknath case that the Parliament had no power to amend the Constitution so as to take away or abridge the fundamental rights conferred by Part III of the Constitution To remove the difficulties created by the Supreme Court in the Golaknath case, the Constitution was amended by the 25th, 26th and 29th Amendment Acts. These amendments were challenged in Writ petitions in the case of *His Holiness Keshavanand Bharati Vs* the State of Kerala. The Special Bench of 13 Judges of the Supreme Court unanimously upheld the constitutional validity of the 24th Amendment Act and in doing so overruled the earlier decision of the Supreme Court in the Golaknath case. The Supreme Court held that all the Articles including those relating to the Fundamental rights can be amended provided that the basic structure and framework of the Constitution are not altered. (*Keshavanand Bharati Vs. the State of Kerala – A.I.R.* 1973 *S.C.* 1461).

It was argued that after independence, Government has considerably failed in meeting the demands and expectations of the people. It was said that the rich have become richer and the poor have become poorer. The property was concentrated in the hands of few individuals in the urban areas Among the many kinds of property, acquisition and holding of land was the most important, with scope for black money to get invested. Investment was preferred in land or building thereon because such property cannot be easily stolen or confiscated The government therefore felt it necessary to have effective checks on the holding of urban land by way of imposition of ceiling limits and regulations relating to the transfer or urban land. The Urban Land (Ceiling and Regulation) Act was, therefore, introduced in the Parliament This Act aimed at the following objectives viz. (1) to prevent concentration of urban property in the hands of few persons and speculation and profiteering therein (2) to bring about an equitable distribution of land in urban agglomerations to subserve the common good (3) to discourage construction of luxury housing leading to consumption of scarce building material and to ensure an equitable utilisation of such material and (4) to secure orderly urbanisation

Mahatma Gandhi, the Father of the Nation had also once said that "all land belongs to the people" (सब भूमि गोपाल की). To translate and implement this philosophy of the Father of the Nation, undoubtedly a ceiling on land was necessary to enable the weaker sections of the society to have some share in the land This philosophy finds some expression in enactment of the Urban Land (Ceiling and Regulation) Act, 1976

The concept of ceiling emerges from the basic idea of distribution of property Under this Act there are four categories of vacant lan (a) land admeasuring 500 squa metres (b) land dmeasuring 10(square metres (c land admeasuri 1500 square metres and (d) lar admeasuring 2000 square metre The cities of Delhi, Bombay, Ca cutta and Madras are included Category A where the ceiling lim set is 500 square metres. Ahmed bad, Bangalore, Hyderabad, Caw pore and Poona are included Category B where the ceiling lin set is 1000 square metres. There a other 36 towns in the different stat which are included in Category where the ceiling limit is 1500 squa metres. The remaining places are i cluded in Category D where tl ceiling limit is 2000 square metre there are 227 towns which are grou ed under this last category

Ceiling Limit

"Ceiling Limit" has been defin in Sub-Section (c) of Section 2 the Act; ceiling limit means tl ceiling limit specified in Section Section 4 of the Act is divided in 11 Sub-sections

Sub-section (1) refers to differe categories and the ceiling impos thereon Sub-sec (2) refers to tl situation where vacant land situated in two or more categories urban agglomerations specified Schedule I to the Act Sub-se (3) deals with vacant lands wi reference to group housing schem sanctioned by the Competent Auth rity. Sub-sec. (4) refers to restri tions on transfer of vacant lar after 17th February 1975. Sub-se (5) states that where any firm unincorporated association or bo of individuals holds vacant land holds any other land on which the is a building with a dwelling un thereon, the same shall be taken in consideration while determining tl ceiling limit. Sub-sec. (6) says th where a person is a beneficiary of private trust and his share in the i come from such trust is known determinable, the share of suc person in the vacant land shall t taken into consideration while d termining the ceiling limit. Sub-se (7) states that where a person is member of a Hindu Undivide Family, so much of the vacant lan

---

Prof Morje, B. Com., B.A., A.C.C S. (LOND), LL. M., is Advocate, High Court, Bombay.

and of any other land on which there is a building with a dwelling unit thereon will be taken into account in calculating the extent of the vacant land held by such a person. Sub-sec. (8) states that where a person, being a member of a housing co-operative society registered, holds vacant land allotted to him by such society then the extent of the land so held by him shall also be taken into account in calculating the extent of land held by such person. Sub-sec. (9) states that where a person holds a vacant land and also holds any other land on which there is a building with a residential unit therein, the extent of such other land occupied by the building and the land appurtenant thereto shall also be taken into account in calculating the extent of land held by such persons Sub-sec. (10) lays down that where a person owns a part of a building, being a group housing, the proportionate share of such person in the land occupied by the building and the land appurtenant thereto shall also be taken into account in calculating the extent of vacant land held by such person. Sub-sec. (11) removes certain doubts in the case of sub-sections 5, 6, 7, 9 and 10.

A person holding vacant land in excess of the prescribed ceiling limit is required to file a statement before the Competent Authority, specifying the location, extent, value and such other particulars as may be prescribed of all vacant land

After the statements are filed under Sec. 6 of this Act with the Competent Authority, the Competent Authority is required to prepare a draft statement of vacant land in excess of the ceiling limit. The Competent Authority is further empowered to prepare the final statement of the vacant land in excess of the ceiling limit (Sec. 9)

The Competent Authority is empowered to take possession of the vacant land even by use of force if any person refuses or fails to comply with the orders directing him to surrender or deliver possession (Sec. 10(5) and (6)

Where a vacant land is deemed to have been acquired by the State Government under Sub-sec (3) of Sec 10, the Government shall pay to such person compensation as stated in section 11 of the Act.

If any person acquires by inheritance, settlement or bequest from any other person or by sale in execution of a decree or order of a civil court or an order or award of any other authority or by purchase or otherwise any vacant land, the extent of which together with the extent of the vacant land, if any, already held by him exceeds in the aggregate the ceiling limit, then he shall specify the vacant land within the ceiling limit which he desires to retain (Sec. 15)

Narrower Definitions of the Words 'Person' and 'Family'.

The definition of 'Person' is very important in the Urban Land (Ceiling and Regulation) Act A person has been defined in clause (i) of Sec 2 of this Act The definition of person includes an individual, a family, a firm, a company or an association or a body of individuals whether incorporated or not.

Under the General Clauses Act, 1897 the word 'person' shall include any company or an association or a body of individuals, whether incorporated or not Section 2(42) of the General Clauses Act (1897) It may be noted that the definition of the term 'person' under the General Clauses Act, does not include a 'family' It is one of the important features of the definition of a 'person' under the present Act that it includes also a 'family'

The word 'family' has been defined under this Act in clause (f) of Section 2 as "Family, in relation to a person, means the individual, the wife or husband, as the case may be, of such individual and their unmarried minor children" A person otherwise than the one who is not competent to contract being a minor i e below the age of 18 years, will be competent to hold property if such person marries before the age of majority, i e. if a boy or a girl marries before the age of 18, such a boy or a girl would be required to file a separate statement under Section 6 of this Act in respect of the vacant land found in excess of the ceiling limit.

A person holding property has several rights and duties under this Act. The definition of the term 'person' includes a family. This Act thus restricts the definition of the world 'family'. The word 'family' merely includes wife or husband of an individual and their unmarried minor children It must be noted here that a Hindu Undivided Family will not be a 'family' under this Act or within the definition of the term 'family'. The presumption of jointness cannot be considered in view of the narrower definition of the term 'family' under this Act.

Further, fort he purpose of determining holding, the property of the husband and the wife also has to be clubbed together as stated in the Notification issued by the Central Government after the enactment of this Act.

Provisions in the Master Plan

In view of the industrial and commercial growth of the cities the Act imposes several obligations on the State Governments to provide for residential zones, commercial zones and industrial zones and such other zones which are necessary for the development of the cities. All the State Governments, therefore, have accepted the Master Plans which try to cater to the needs of development of the city areas The Central Government and the State Governments have introduced plans from time to time in their respective territories. The Government of Maharashtra earlier by the Bombay Town Planning Act, 1954, which was subsequently repealed after the enactment of the Maharashtra Regional Town Planning Act, 1966, had tried to develop and regulate the needs of the urban cities in the State. The Maharashtra Regional Town Planning Act, 1966, has its separate Rules. Greater Bombay has separate development Control Rules.

While considering the Master Plan for urban land the definition of the expression 'urban land' must be taken into account. The said expression is defined in clause (o) of Section 2 of this Act.

The Competent Authority if it is satisfied that land is required by the holder for the purpose of re-development in accordance with the Master Plan, such Authority may permit the holder to retain such land in excess of the ceiling limit (Sec. 22 (2)) Before such holder is allowed to retain the land for the purpose of re-development in accordance with the Master Plan, he should file a statement under section 22(1) of the Act.

The Rule 13 made under this Act states that every application under sub-section (1) of Section 24 shall be made in Form No. 7 which shall contain the particulars specified therein

Powers of the State

The word "State" includes a Union Territory and the State Government in relation to any land or building situated in a Union Territory or within the local limits of a

cantonment declared as such under Section 2 of the Cantonment Act 1924, means the Central Government.

Article 12 of the Constitution of India also defines "State" under the said definition unless the context otherwise requires. The State includes the Government, the Parliament of India, the Government and the Legislature of each of the States and all local or other authorities within the territory of India or under the control of the Government of India.

The word "State" therefore includes; (1) the Government and the Parliament of India (2) the Government and the Legislature of each of the States(3) the local authorities and (4) other authorities within the territory of India or subject to control of Government of India

This Act has not come into force in all the States of the Union on 17th February 1976. The States which have adopted this Act or made this Act applicable at the first instance i e on 17th February 1976 are the States of Andhra Pradesh, Gujarat, Haryana, Himachal Pradesh, Karnataka, Maharashtra, Orissa, Punjab, Tripura, Uttar Pradesh and West Bengal

The States where this Act was not adopted on 17th February were Assam, Bihar, Jammu & Kashmir, Kerala, Madhya Pradesh, Rajasthan, Nagaland, Sikkim and Tamil Nadu, all these States have not adopted this Act.

The State has power to exempt certain lands from the application of this Act specifically referred to in Section 19 of this Act

The Government has also power to exempt vacant land on ground of public interest and on ground of hardship

The Government has further power not to treat vacant land as excess land when such land is used for the purpose of constructing dwelling units for providing accommodation to the weaker sections of the Society.

The Government is also competent to allot any vacant land for the purpose of or relating to or in connection with the industrial or for private residential accommodation.

Co-operative Societies

Under sub-clause (v) of Section 19 of the Urban Land (Ceiling and Regulation) Act, 1976, any co-operative society being a land mortgage bank or a housing co-operative society, registered or deemed to be registered under any law relating to co-operative societies for the time being in force is exempt from the application of Chapter III of the Urban Land (Ceiling and Regulation) Act, 1976, which is the Chapter on ceiling on vacant land. This exemption is subject to the provisions of sub-section (2) of Section 19. The Land Mortgage Banks are now known as Land Development Banks Chapter XI of the Maharashtra Co-operative Societies Act, 1960, refers to such Land Development Banks.

A 'Housing Society' is defined in Section 2 of the Maharashtra Co-operative Societies Act, 1960. It means a society the object of which is to provide its members with dwelling houses (sub-section (16) of Section 2) Queries are very often raised to find out whether it is necessary to seek permission of the Competent Authority if a flat in a housing society is to be transferred to other person As far as Co-operative societies are exempt from the application of the provisions of Chapter III of the Urban Land (Ceiling and Regulation) Act, 1976, it is submitted that permission of the Competent Authority is not deemed necessary

It must be noted that for determining the ceiling limit on vacant land, where the person is a member of a cooperative housing society registered or deemed to be registered under the law for the time being in force holds a vacant land allotted to him by such a society, then the extent of the vacant land so hled shall also be taken into account in calculating the excess vacant land held by such person. The object of such provision appears to be that as there is restriction on the holding of property, a person may not be permitted to hold a property by acquiring it in different housing societies which may result in defeating the true object of the co-operative societies

Exemption of Vacant Land from the Application of Chapter III

This Act aims at prevention of concentration of property in the form of vacant land in the hands of a few persons This Act, however, does not impose any restriction on the land held by the organisations, local authorities, Corporations or other public institutions. The Act, therefore, does not apply to the vacant lands held by—

(i) the Central Government or any State Government, or any local authority or any Corporation established by or under a Central or Provincial or State Act or an Government company as defined in Sec 617 of the Companies Act, 1956 (1 of 1956)

(ii) any military, naval or air force institution;

(iii) any bank;

(iv) any public charitable or religious trust (including wakf and required and used for any public charitable or religious purposes;

(v) any co-operative society being a land mortgage bank or a housing co-operative society, registered or deemed to be registered under any law relating to co-operative societies for the time being in force,

(vi) any such educational, cultural, technical or scientific institution or club etc.

(vii) any society registered under the Societies Registration Act, 1860 (21 of 1860), or under any other corresponding law for the time being in force and used for any non profit and non-commercial purpose;

(viii) a foreign state for the purposes of its diplomatic and consular missions or for such other official purposes as may be approved by the Central Government or for the residence of the members of the said missions;

(xi) the United Nations and its specialised agencies for any official purpose or for the residence of the members of their staff,

(x) any international organisation for any official purpose or for the residence of the members of the staff of such organisation

After the implementation of this Social Economic Legislation, it is expected that (i) the speculation in the land and concentration of urban property is expected to reduce day by day, (ii) a great deal of haphazard and unplanned growth will be stopped, (iii) value of land will be checked if not reduced or at least it will not be allowed to rise beyond reasonable limits, (iv) the builders and contractors will be induced and required to have their new projects outside city limits, (v) the land will be made available for the Public Institutions and public purpose, and (vi) the weaker sections of the people and industrial workers would get residential accommodation at cheaper cost. □

Reader's Forum on
Intergrated Rural Development

Yojana is happy to present readers' reaction to Dr. V.K.R.V. Rao's thesis on the concept of Integrated Approach to Rural Development as contained in his Sixteenth Convocation Address to the Indian Agricultural Research Institute. Excerpts of this address were published in Yojana of 15 February 1977 with an invitation to the readers to offer their considered comments on the suggestions made by Dr. Rao. Three replies have been received from academics and they are reproduced below. Yojana will be happy to publish more comments provided they are received before June 1, 1977.

A CONCEPTUAL FRAMEWORK FOR INDIA

P. N. CHOPRA

DR V.K.R.V. RAO, in his thought-provoking lecture (reported in Yojana February 15, 1977), has rightly questioned the realism and relevance of the currently popular concept of Integrated Rural Development in the present Indian context. He has made three very pertinent observations. (1) Development is an inter-disciplinary concept dealing with the increase in productivity as much as its distribution among the rural masses, (2) redistribution for social justice must not encourage non-viable production units; and (3) science and technology, which is at the centre of integrated development, is unable to ensure fair distribution of benefits of development to the rural poor unless there is a more equitable distribution of productive assets among rural families.

Development in India has been so far planned from above. Planning has by and large been a traffic of project proposals and resource allocation by the State governments and the Central ministries through the Planning Commission The State governments have been allocating the available developmental resources among different districts through various departments on an *ad hoc* basis. The main instrument of developmental effort at the block level has been the team of extension officers who have been striving to meet the felt needs of the people of the area through available funds. The result is a good deal of 'wastage' of scarce resources on the one hand and frustration among the rural people on the other. The Community Development Approach with which we had pinned great hopes proved ineffective largely due to the lack of a remarkably profitable new technology adaptable by all sections of the rural people. Even the seed-fertilizer revolution in case of a few grain crops could not percolate down to the small/marginal farmers due to the various physical and financial handicaps. The inequality of rural progress, both areally and sectionally, has necessitated the adoption of the integrated area approach

That development of natural and human resources is area-bound and can be effectively planned only at that level cannot be disputed. This is the essence of regional planning Resource development has a spatial dimension, Immobility of physical resources and their spatial distribution in quality and quantity are basic compulsions for decentralisation of planning for the area-level. In a country of sub-continental dimensions as India is there is so much of diversity of physical and climatic conditions that a blanket approach is bound to aggravate regional inequalities. This is mainly due to the inability of a centralised planning machinery to adopt an integrated view of the peculiar resource development problems in different areas. Not only this, in India the various State government departments have followed a segmented approach to development at the area level. The gap between plan promise and performance is much to be found in the area-level development programmes.

Integration of area-level plans is a basic necessity due to the fact that all developments have to be ultimately located somewhere in space. The spatial element in planning is the binding force behind all sectoral programmes. If planning is to have this spatial dimension incorporated within it, we must ensure three-fold integration in all programmes. One, integration of all activities connected with land-use. Call it spatial integration. Two, integration of the functions of different developmental agencies so that they think and act to solve area development problems collectively. This is better called institutional integration since this ensures consonance of objectives of development agencies Three, hierarchical integration.

Shri Chopra is Lecturer, Government College, Hoshiarpur.

The planning function is a joint endeavour of a hierarchy of planning bodies – the area-level authority, the State Planning Board and the Planning Commission. Successful planning depends on the feed-back of information from lower to the higher authorities. Meaningful planning is possible only if there is hierarchical integration.

The three-fold integration of area development programmes can be achieved only through a systems approach. Every area presents a problem situation of its own type. A predominently industrial-urban area represents a system quite different from the system of an agricultural resource rural-dominated area. The boundary of an area for development purposes shall be determined by the delimitation of the area as a functioning system. A system consists of a nucleus and its elements or parts which are interrelated and which function to variously fulfil the objectives of the system as a whole. Problem areas have a nucleus or centre at which the functional efficiency of the system elements is reflected It is like the heart in human body system, parts are like the limbs A poorly functioning system is loosely integrated and gets paralysed at the slightest jolt. A well-integrated system has the vitality to withstand exogenous shocks and contains the adaptive mechanism for change in environment. In the language of systems analysis, it has the necessary feedback mechanism provided within itself. A region has its hierarchy of cities or functioning nodes or nuclii. The character of the cities reflects in ample measure the nature of the region as a system The subregions in a homogeneous area are like the body-limbs of the region having distinct functions depending of the nature of organisation of the region as a system.

It is possible to illustrate the aptness of the systems approach to area development through a concrete example. Take the case of the sub-montane area in Punjab. This area has a distinct personality of its own being characterised by undulating yet slopy relief, loose textured, sandy-gravely soil, erratically-aligned-and-distributed underlying rocks, some pervious and others impervious. It is a small watershed with poorly-organised drainage system in the form of numerous 'choes' or seasonal hill-torrents carrying siltladen waters only during the monsoons. The area stands divided distinctly into three parts: (1) The uplands called the 'Kandi' area-the montane edge from where most of the 'choes' originate. It is dissected by gullies and khuds carved out by accelerated erosion after deforestation followed by indiscriminate sheep and cattle grazing during the last 125 years There is no possibility of digging shallow tubewells for irrigation here. Even drinking water scarcity is experienced during summer months before the monsoon. (2) The uneven, slopy midland where choes have deposited in a fanlike fashion their sands gravel and debris, called 'Rakkar' land this part of the area consists of relatively poorer soil with highly pervious material deficient in lime and phosphates as also organic matter. Only deep irrigation tubewells are a success here (3) The third part of the area is lower lands where most choes lose themselves either in the fields or join some live stream Shallow tube-wells can be easily bored and used In 'choe beds' water oozes out during winter so that Rabi crops can be grown here without irrigation. Hence the name 'Sirowal'. The three parts of the area are interlinked physically, geographically and economically. Accelerated erosion in the uplands and cultivation of the lower slopes has increased the fury of floods and pushed herdsmen uphill Wherever afforestation has taken place, water table has come up on lower lands, choe flooding and siltation is less Geographically, the area's towns are a classic example of 'parasitic' cities draining their hinterlands and having no generative growth for themselves. Level of economic activity in the towns depends directly on the performance of their hinterlands. The cities have remained stagnant despite normal growth of population in the area because there has been large-scale migration to the industrial towns on the G.T. Road and to foreign countries like U.K., Canada Dubai, Kuwait and other trucial states. The area has been a loosely-functioning, inefficiently managed system isolated from the rest of the State which has been the most progressive in India. The area has failed to absorb the seed-fertilizer revolution due to its disabilities

The systems approach to area development ensures integration of the area plan automatically. Within this framework, Dr. Rao's thesis of arriving at a viable holding, a viable village and a viable town is tantamount to determining models of micro units which can function effectively in the larger macro setting. The crux of the problem at present however is to open up the villagers and their holdings to receive the external stimuli, and allow human settlements to get consolidated along the roads to form a pattern. Provision of social services will then be most economical and socially satisfying. There is no one all India pattern. Each area has a system of human settlements which forms the foundation of integrated development. This is only one aspect of the problem of planning. There are other dimensions which are prior to this aspect in the sequence of development operations An area's development process can be described as interaction of three elements the natural resources, the human resources and the technology employed by the latter to use the former. Given the quantity and quality of natural resources, it is the quality of human resources and the technology employed which determine the level and pattern of area development. A more productive technology demands higher human skills as well as new capital assets In an overpopulated, less developed region, technological innovations can be the only source of growth and these must be diffused all over the region as quickly as the state resources allow. Every technology has its cultural environment and institutions must change along with technology. Technology and institutions must match the resource endowment of the region. Where the three are not 'matching', there are problems of technology transfer as and when it is available. These problems can be minimised if we think within a systems framework. Area development is improving a system to function better. In so far as technology is the key factor in the process, the present stress on science and technology is understandable □

A Re-Thinking on Rural Development

AN EXPERIENCE OF NORTH WEST BIHAR

DR. H. BHAKTA

THE GOVERNMENT OF India have to start pilot projects for integrated rural development in twenty districts, one in each State with the accent on the full utilisation of science and technology for solving the problems of rural development. From the administrative angle Professor V.K.R.V. Rao is in favour of re-thinking in the meaning of integrated rural development and factors of selection of unit of development (Yojana, 15-28, February, 1977). However, the empirical study of Agrarian Relations and Development in North-West Bihar (My unpublished Ph.D, Thesis, Patna University, Patna, 1976) prompt me to say that for the solution of the problems of rural development, the analysis of mode of production in its historical perspective mainly in terms of the system of production can not be overlooked. Hence thinking ahead on "a rethinking" is called for.

Scope of Integrated Rural Development

We know that development is a continuous process which concerns not only "the provisions of opportunities, and their actual utilisation" but also the creation of opportunities for self-propelling continuous development of productive resources – natural and human. The cropwise, villagewise and classwise analysis of agrarian economy of North-West Bihar reveals that it is not developing rapidly either because there is the system of production for use value or there is lack of market orientation or there is weak market orientation In the absence of strong market motivation of production we may achieve certain level of development but self-propelling continuous development will be far away. Marx also says "in any given economic formation of society where not the exchange value but the use value or product predominates, surplus labour will be limited, and that no boundless thirst for surplus labour arises from the nature of production itself" (Marx, Capital, Vol 1 p 260 Kerr edition). Marshall hints indirectly at the same point when he opines that large scale production is limited by the extent of market. Actually, development of human and natural resources covers both the production and exchange aspects of activities. It is in the process of exchange that the conditions of rapid development – markets for the means of production and means of consumption – develop. Hence, the pilot projects for integrated rural development will be incomplete without special consideration of exchange activities i.e. how the goods and services are exchanged in the rural economy. This has great bearing on the mode of production and development mainly through the distribution of income and assets in the society

Dr. Bhakta is Lecturer, Rajendra College Chapra (Bihar)

Factors of Unit of Development

Professor Rao is perfectly right in ascertaining the census village as revenue village. unsuitable for the unit of development. But he accepts population and area – the traditional and static factors for the norms of that unit. No doubt these are necessary but not sufficient ones Village having the same area and population may be at different levels of mode of production with varying degrees of market motivation. Measures adopted for a village where the system of production for use value predominates will not be suitable for the village where the system of production for market has emerged. Capitalist measures may help development only in a post-feudal setup where market orientation of production is strong. In other cases anti-feudal measures are also required to break the bottle neck of the system of production for use value. Thus, in the existing transitional stage of development of the mode of production the production for use value/exchange value must be taken into consideration while selecting a unit of development.

Further, villages are not an isolated ones They have close socio-economic relations with adjoining villages. There are instances where the landlord and the cultivator get all their labour power required from another villages, while in another instance, villagers have all their land situated in another village Such situations influence productivity and development greatly. Therefore, while considering population and area for the selection of development unit the socio-economic relations with adjoining villages should not be overlooked.

Besides, the socio-economic structure differs from village to village. Landlords, cultivators, small and marginal farmers and landless labourers have varying proportions in the class structure influencing productivity and development differently through the distribution of benefits of development. Therefore, the village, a unit of development should comprise the class structure of national character.

Further Professor Rao is not in favour of alloting little land to landless labourers on the ground that it is "a disincentive to the motivation to initiate projects for non-agricultural activity" and in some areas, the earnings of agricultural labourers are higher than the earnings of sub-marginal farmers. This may be true in the subsistence economy of the system of production for use value. In the exchange value system of production, sub-marginal farmers may shift their agricultural resources including land to the production of commodities like live stock, vegetables etc. for market which would require much more

labour than food grains. Here, earnings are also higher. On the other hand, this will reduce the pressure of employment on non-agricultural activities. In other words, the pilot projects for rural development should not come with the measures to abolish small farmers but with measures to strengthen their economic position by inducing them to produce commodities like live stock, vegetable etc. for market.

As regards the nature of development of science and technology I would like to say that these should be such that their benefits should go to the labourers. Perhaps, by labour intensive technology, Professor Rao means this. This will raise the productivity leading to higher earnings of labourers and also of full utilisation of resources under the system free from exploitation. For all this exchange activities of rural life require regulation and control. Because, it is in the process of exchange that the benefits of development of science and technology can be regulated in favour of labourers.

The above analysis suggests that Professor Rao's approach requires thinking ahead in the light of the mode of production, stage of development, system of production, socio-economic structure of the unit, socio-economic relations with adjoining villages, diversification of agricultural resources of mainly small farmers and the distribution of benefits of technological development in favour of labourers. However, machinery are required to review the projects; to modify them like community development projects, to drop them like cooperative farming and to encourage new approaches like commercial bank credit. □

INTEGRATED AREA DEVELOPMENT PROGRAMME

S N. MANE

BOTH IN THE pre-Independence and the post-Independence periods a debate on poverty in India has remained more or less an academic exercise. In a way Maharashtra can legitimately claim credit for starting in April 1965 the pioneering Integrated Area Development Programme initially in eleven villages of Tasgaon Taluka of Sangli district. It was mainly confined to the small and marginal farmers. Its principal object was to make the small and marginal farmers viable units so that they can compete favourably with the big and influential farmers The programme grew in its range and magnitude, and since July 1969 it came alternatively to be known as Pilot employment Guarantee Scheme. As the scheme was extended to the landless labourers its emphasis was shifted from viability principle to the employment guarantee. It is known as 'Page Scheme' because Shri V.S. Page was one of its promoters. On March 10,1975, the Finance Minister, while presenting the budget for 1975-76, proposed certain new taxes with a view to financing the new Rural Employment Guarantee Scheme which is an offshoot of the Integrated Area Development Programme. It is our experience that these programmes and schemes, though necessary, are not sufficient conditions of the integrated rural development. This has been revealed by a number of Evaluation Reports' and critical articles. The Evaluation Reports including the one by Shri Page himself have concluded that the experience of the scheme is not only unsatisfactory but it is also disappointing. Almost all the reports have demonstrated that 'the professional politicians' who act as the middlemen in the development programmes are largely responsible for the unsatisfactory working of the scheme.

It is in this context that Dr Rao's thesis on Integrated Approach to Rural Development rightly deserves to be acclaimed as a challenge and not an alibi of rural poverty

The merit of Dr Rao's thesis is not an extension in the conceptual kit from the narrow confines of a numerical capital to the human capital or 'an investment in man' as Prof. Myrdal calls it, but his plea for restructuring and regrouping the economically non-viable villages into viable ones His argument assumes an added significance when one observes that more than 50 per cent of the village Panchayats have each less than Rs. 1000 as their annual income. Similarly nearly 33 per cent of the village societies are without full-time secretaries. The school, society and the panchayat in every village or in a group of villages are supposed to be the effective agents of socio-economic development at the grass-root. But the actual of functioning of these grass-root institutions has a different story to tell. There are a number of villages which cannot afford to have adequate school buildings of their own to accommodate all the pupils at one place. The principal reason among other things is the paucity of village funds. A large majority of villages are economically non-viable units. The restructuring and the re-grouping of such villages no doubt possess a formidable problem. But much of the dreadfulness can be attributed to what Prof. Myrdal calls 'the lack of political will' or 'the soft state' that India is

With these remarks on the most radical aspect of the plea of Dr. Rao's thesis, I would like to offer my comments on two controversial issues in his thesis.

On the redistribution of surplus land to the landless Dr. Rao has his own reservations He cautions that the redistribution of surplus land surfaces among the landless labourers would multiply the number of the under-employed. Here Dr. Rao subscribes to the view that Dr. Minhas held in 1970. Dr. Minhas stated : ".... the purpose of land redistribution is not to turn non-farmers into farmers but only to improve the position of the small cultivating operators[2]." Even Dr. Gadgil in his capacity as the Dy. Chairman of the Planning Commission expressed his own doubt in these worlds: "Here, the basic problem is not that of bringing about larger redistribution of land surface but that of combining land surfaces operated by vast number of small holders into units suitable for efficient cultivation[3]." Pursuant to this

Prof. Mane is the Head of economics Department, Balwent College Vita.

argument, Dr. Rao raised a pertinent question and anticipates the expected answer He says: "Would it not be desirable to use any land available for redistribution to increase the size of the holdings of these marginal and sub-marginal farmers rather than add to their number by giving lands to the landless labourers"? (p 14) Thus his Integrated Approach favours the principle of efficiency and fears the principle of equity.

Dr. Rao justifies the redistribution of land to the marginal and submarginal farmers with a view to increasing the size of holdings and decreasing the number of the underemployed. But it would be unrealistic and doctrinaire not to take due notice of the fact that an increase in the size of holdings, beyond a certain point, paves the way for capitalist farming which would, by its very nature, swell the army of the rural proletariat This unhealthy tendency of increasing concentration of land ownership in a few farming households has been confined in the recently published Agricultural Census Report. Dr. Rao makes a reference to this unhealthy tendency as revealed in the Report but he does not take a serious note of it because he is worried more about the underemployed than about the rural proletariat.

The capitalist farming which, by and large, is the result of increasing concentration of land-ownership in a few farming households, is not justified for the following three reasons Firstly, "the rich cultivators in a country which is not self-sufficient in foodgrains, would first of all tend to hoard their grain in years of good crop outturn and secondly would try to restrict the production of foodgrains to maintain and increase prices by reducing the areas sown[4]." Secondly, it tends to swell the army of the rural proletariat in place of the peasant-proprietors Thirdly and more significantly in the present context, the myth that large scale farming means almost invariably a higher output is being more widely exploded by empirical testing This brings us to the second controversial issue in Dr Rao's thesis

Under Dr. Rao's Integrated Approach the landless labourers are not to receive benefits of the redistribution of the surplus land. For them Dr. Rao suggests the "programmes of full-time employment or self-employment activity in the non-agricultural field that would speed up progress of industrialisation (p. 14).

Here Dr. Rao is not perfectly clear If by non-agricultural field he means siphoning off the surplus labourers to such projects as building the roads, digging the wells, afforestation soil-conservation, irrigation and drainage, it would create more problems than it would try to solve Here Dr Rao comes closer or under the influence of the Nurkse-Lewis Model which is not relevant to Indian conditions Firstly, it fails to view the problem of surplus labour from the micro-economic angle Hence it does not determine exactly who and how many of the surplus labourers are to be transferred away from agriculture and to the non-agricultural field Secondly, the model fails to distinguish between 'the seasonable surplus and the removable surplus[5].' Thirdly, if by the non-agricultural field Dr. Rao means the organised sector the practical applicability of the model under Indian conditions has been disputed by some economists. For example, Dr. Khusro in his thesis 'Economic Development with No Population Transfer' has argued against the Nurkse-Lewis Model He states " Only when the demand for labour in the modern sector exceeds the supply of labour from all these sources does a net shift of workers from agricultural sector becomes economically justified Otherwise the result is only an addition to the pool of unemployed in the modern sector[6]." With the saving and investment rates remaining more or less stagnant on the one hand, and an accelerating rate of population growth on the other, the modern sector cannot be in a position to fully and gainfully absorb surplus labour at least for some time to come.

Dr. Rao, as we observed above, has voted for the underemployed and against the rural proletariat But here the choice is not so much between big and small size holdings as it is between higher and lower agricultural output. The Farm Management Studies conducted by the Government of India and the Field Surveys undertaken by experts like Bhattacharya and Saini (1972) and Krishna Bharadwaj (1974) have demonstrated 'the inverse relation between size of holding and productivity ' These studies have explained the inverse relation on two grounds, (a) smaller farms are more fertile, and (b) smaller farms have some technological advantages due to diseconomics of scale. In other words, a relatively small-size farm absorbs a family labour more intensively. Experts like A. Rudra and A. Sen have strongly doubted the observed paradox of the inverser elation between size of holds ing and out put But under condition-of high irrigation intensity and the individual crop grown within a village the inverse relation is widely accepted. Before the inverse relationship is universaly established the need for more reliable evidence relating to the heterogeneity in agriculture is acutely felt. In the words of Prof Amartya Sen, "It would thus appear that the labour-cost based explanation has not so far been falsified by any of the production function studies presented. It must, however, also be recorded that sufficient empirical testing of the explanation has not been done to enable us to confirm or reject the hypothesis with any confidence[7]. This is the great challenge to be squarely faced by the social scientists

THE CULTURAL

M. S. SUBBULAKSHMI sings in Shillong and Ali Akbar Khan plays in Shimoga; Yamini Krishnamurty dances in Vadodara or Tejpur; Badal Sircar is translated and staged in Pune and Vijay Tendulkar in Bangalore; Kerala's Soman shows his oils' in Delhi; Kogga Kamath enthrals Delhi audiences with his Yakshagana puppet show and, young film institute graduate George shows his experimental work with great aplomb

This sums up the, cultural scene today. Neither religion nor language—it's culture which has promoted integration; traditionalism is despised as obscurantism, and tradition is fostered. The art traditions of a region are no more confined to itself; the literary masterpieces in a language are no more shut off from others in the country This is what we have accomplished in the past few years.

Art is the reflection of the vitality and culture of a people. Seekers of knowledge and lovers of art among the travellers to this country in the remote past carried back with them the message of Indian wisdom and souvenirs of Indian art. Indeed, art had been part of every day life of the people – whatever article they used in their work, worship and recreation and the very way they lived and performed their various duties reflected their innate sense of beauty When people suffer from political or social exhaustion, their life loses verve and vigour and their art tradition becomes sluggish When the British established the Raj in the country, one of the first things they did to curb national pride was to disengage people from their art consciousness The educational system deliberately ignored promotion of art The generations which went to schools and colleges and served the alien administration in the 19th and part of the 20th centuries were thus isolated from the art traditions of the country.

When the country became independent, a major task for the leadership was to reinculcate among the people national consciousness for speedy, total reconstruction. As man reveals himself to himself through art and makes it the vehicle of expression of the desires, urges, hopes and dreams, in his struggle to make life worth living, independent India set out on a journey to rediscover itself culturally

In 1953 the Sangeet Natak Akademi was constituted for the promotion of music dance and drama, in the following year came the two other academies – the Sahitya Akademi and the Lalit Kala Akademi to work actively for the development of Indian letters and for the promotion of visual and plastic arts respectively Nurtured under the guidance of great thinker-writers and connoisseurs of art Jawaharlal

Mr. Patanjali is Research Officer, Research and Reference Division and is an art critic

SCENE — *A Survey*

V. PATANJALI

Nehru, Maulana Abul Kalam Azad and Sarvepalli Radhakrishnan, and the three academies not only promoted existing talent but also encouraged young enthusiasts and helped them to find their feet.

Art being at once education, entertainment and recreation helps to create the conscience of the age and whatever is done to promote art must be done in a systematic and planned way within the overall framework of national reconstruction. At the suggestion of the then chairman of the Sangeet Natak Akademi a scheme was evolved in 1966 to preserve our old folk songs, folk dance forms and old costumes Thus began the extensive survey and documentation of rare forms of traditional performing arts. Teams of research scholars dug into old chronicles and records and talked to connoisseurs and practitioners of dying art forms and prepared an inventory of indigenous entertainment forms. Following this, the teams reached many forgotten centres of art, interviewed the 'rustic entertainers', recorded their impressions and filmed them in action.

Many unique art forms which were languishing for want of patronage have been given a new lease of life Ageing gurus and ustads have been given financial and other assistance to continue with their art tradition.
They have been persuaded to teach the arts to young enthusiasts And now performances of traditional arts have become a regular feature during cultural seasons.

Among the arts saved from extinction by these enterprising and devoted research teams are Ravan Chhaya, the shadow puppet play of Dhenkanal in Orissa; Pava Koothu, the glove puppet drama of the Palghat region in Kerala; Bolan, the operatic drama, and Patua, the ballad singing tradition, of Murshidabad in Bengal; Ojha Pali and Sukh Nani, the group singing forms of Darang district in Assam and ; Oggu Katha, the vigorous ballad-style drama of the Telengana region in Andhra Pradesh. And many more folk art forms have been discovered and preserved for posterity

Alongside, the existing folk art styles have been developed and promoted Noted exponents are awarded prizes and honoured annually; institutes for training are given grants not only for teaching but also for purchase of eqipment and construction of buildings. Khayal of Rajasthan, Bhavani of Gujarat, Bhand of Kashmir, Jatra of Bengal. Ram Lila of Uttar Pradesh, Burra Katha of Andhra, Dashavatara of Goa, Yakshagana of Karnataka, Ankiya Nat of Assam, Therukoothu of Tamil Nadu, Tamasha of Maharashtra – all these regional folk entertainment forms have become household names all over the country largely owing to the encouragement

Kathakali dance drama

given by the State not only for sustenance but also for promotion through arranging inter-state cultural exchange programmes

Scientific spirit with an inter-disciplinary approach for the study of problems of music is perhaps the most significant aspect of our musical scene today. How did sound develop into notes? What is the relation between the abstract concept of Shruti and its viable aural form? Can we seek to expand its scope? What is the psycheacoustic basis of our music? Is the microphone a boon or a curse for the musicians? How can we improve on the tonal qualities of our musical instruments? Many are the vexing problems for a thinking artiste and to seek solutions he has to work in collaboration with musicologists, psychologists, physicists and technicians. The Sangeet Natak Akademi has set up an acoustics laboratory in New Delhi where Dr Chaitanya Deva conducts research into many of these problems The Akademi has organised a number of seminars and workshops to probe the origin and development of musical scales, psychological responses to Raga structures and computerisation of Indian music.

One interesting experiment conducted by the Speech Group of the Computer section of the Tata Institute of Fundamental Research (Bombay) at the recent Akademi-sponsored workshop at Bangalore, was to use the computer as a musical instrument – as a South Indian Veena. The experiment consisted of taping veena music under conditions of minimal ambient noise, making data collection on a sonograph and carrying out music synthesis on a computer One artiste played some samples of synthesised music, a composition of Purandara dasa and a Jatiswaram in the raga Bilahari, and the original to show that the two were quite close and that the quality of music produced by the computer depended very much on the data supplied to it of any musical piece. The purpose of this experiment in real terms is to seek to evolve a sound notational system for Indian music

As a result of all this activity, there is now a basic change in the method of thinking about music and problems connected with the cultivation and propagation of music The Akademi encourages research in music by sanctioning grants to musical organisations and academic institutions. Some Indian universities have recently introduced new courses in science of music. Musicians and makers of musical instruments have been constantly trying to improve and innovate on the structure of instruments.

Talking of the general musical scene, there has been quantitative as well as qualitative improvement. There has been a phenomenal increase in the number of institutions devoted to fostering music and music circles and sabhas Music loving public has been growing, and as more teachers are trained increasing number of singers and instrumentalists are seen today

The advent of an industrial society, growth of mass audience, progress of technology, suburban living, pressure of time and other factors have influenced musical styles and their evaluation considerably The emphasis shifted from the casual and the leisurely to the prompt and the precise No more waiting endlessly for an ending fate. A musician now faces the challenge to distill his best within a specified time –which makes his own critic – and present the cream of his musical intellect It is unrealistic to say that restrictions of time have crippled the art of music and that it violates tradition. How is tradition violated by the presentation of a Raga in its pure, neat and crisp form? Has the epic novel suffered by the evolution of short story?

Another welcome development has been the crumbling of the old, rigid gharana styles which impeded qualitative growth of music A catholic and cosmopolitan outlook in musical values is what is discernible today among both performers and listeners

Music is the most abstract yet most popular art. The National Programme of Music broadcast over the AIR network and the annual Sangeet Sammelans draw vast audiences Young musicians are encouraged by awarding prizes annually and by giving them opportunity to exhibit their artistry over the radio Nearly 44 per cent of AIR's total broadcasting time is allotted to featuring music through its various channels.

The essential melodic character of Indian music notwithstanding, attempts are made to harmonize and orchestrate Indian music by AIR Vadya Vrinda. That the unit has attained considerable success

A scene from Ram Lila presented by Bharatiya Kala Kendra, New Delhi

was evident when two of its entries of orchestral compositions won awards at the Asian Broadcasting Union competitions recently.

The general enthusiasm for music among people has prompted some of the wellknown commercial houses to enter the field. The founding of institutions for the promotion and study of music and other performing arts and organising festivals of music and dance are among the cultural activities taken up by the Tatas, Bata Shoe Company, Delhi Cloth Mills, Indian Tobacco Company and others.

And any reference to qualitative improvement of Indian music must take into account the contribution made by Pandit Ravi Shankar, the sitar maestro, who was also instrumental in promoting Indian music abroad He was one of the earliest to realise that it would be disastrous to think that a Sunday evening concert-goer is no different from the audiences at all-night mehfils. The whole approach had to be different, without the qualitative content of music being different. He took a hint from the "pure and orthodox Karnatak style" and began attempting crisp, short duration expositions. It was again Ravi Shankar who insisted on punctuality, discipline and decorum both at concerts and classes

Summing up, it can be said that Indian music has never had it so good. Performers today enjoy more freedom, greater leeway and higher remuneration and the listeners a much more varied fare of qualitative music than ever before.

Dance Scene

How does classical dance steeped in the lore of the land cater to the changing secio-economic setting? How long more do dance lovers have to witness the same items repeated *ad naseam*? The test of true art is its dynamism, creativity and adaptability both in form and content. Even Bharata, the author of Natya Shastra, says in no uncertain terms that there is nothing like eternal values in art and that art has to subserve the interests of the society which sustains it. Then, do our dancers lack imagination, or support?

When the Akademi began extending support, the creativity of our dancers also began to blossom. The assistance from several state agencies has helped artistes to expand and widen their repertoire to making dance more comprehensible to the general public, and to make the oldest dance form a vehicle of expression of a most modern idea, most pressing contemporary problem The name of Mrinalini Sarabhai comes up first. She has been experimenting with Indian dance forms to explore new dimensions of mimetic utterance. *Manushya, Song of Creation, Ballet on Death* are some of the ballets choreographed by her. Trained basically in the Kathakali and Bharata Natyam techniques, she blends most appropriate features of all forms giving the performance a feel of contemporary western idiom. In *Manushya*, she depicts the journey of man from birth to death – his hopes, his dreams, his aspirations, his struggles and his joys dotting the physical sojourn. The mystic poem of Rig Veda is rendered in dramatic movement in *Song of Creation* which is perhaps the first abstract dance composition in India. The third work shows how obsessed Mrinalani has been with the problem of suicides among the women of Saurashtra. The variations of rhythm on the typical Kerala drum *idakka* portray the interaction of the community's cruelty and the woman's emotion through four seasons of her life. For the woman death is not the absence of life, it is the absence of love.

Why I described in detail the work of Mrinalini and Darpana team is that their work sums up the new spirit of experimentation both in content and form one comes across today. Jawaharlal Nehru's *Discovery of India* has been attempted as a ballet by two or three groups, all choreographed in what is knov as the Oriental idiom which seems be popular with many choreogı phers. Sachin Shankar, Narend Sharma, Prabhat Ganguly a others. Rukmini Devi contin her work in the chaste Bhara Natyam idiom and confines hers largely to puranic and devotio themes while Birju Maharaj happy with his Kathak style co positions recapturing the glory Avadhetal The masters of Katl kali, however, ventured into n mythologicals like, *Kristu Charit* and *Sohrab and Rustom*. It n take some time for the traditio Kathakali audiences to acc

Chhau dancer from Seraikella, Orissa

Jhaveri Sisters & Group in 'MAHARAS', Manipuri dance

these novel ideas; the cosmopolitan gatherings outside the home of the dance did welcome the departure.

As in the case of music, scholarships for young enthusiasts by the State have helped both students and the teachers who receive a certain amount of the stipened money as tution fee. Besides, institutions devoted to dance also receive grants to construct buildings, conduct classes, present special dance features and ballets. The Akademi conducts two institutes for training in Kathak and Manipuri, the Kathak Kendra in New Delhi and the Jawaharlal Nehru Manipuri Dance Academy in Imphal and assists other well-known organisations like, the Kalakshetra, Madras, the Kerala Kalamandalam, Cheruthuruthy, Darpana, Ahmedabad, Siddhendra Kalakshetram, Kuchipudi and the Nritya Kala Parishad, Bhubaneswar

Dance is the most popular performing art, it appeals to visual and aural emotions A number of schools have sprung up in cities and towns for teaching dance However, there is the gap in the comprehension of the meaning and import of various dance items at a Bharata Natyam recital which are generally in Telugu, Kannada or Tamil. Various innovations have been tried out to circumvent this problem. One has been to attempt Meera Bhajans for dance rendering.

A Marathi-speaking teacher of Bharata Natyam from Bombay was encouraged by the state government to research into the works of rulers of Thanjavur. He brought out a whole set of compositions in Marathi set to Karnataka melodies by Shahaji, the 19th century Maharashtrian ruler, meant for Bharata Natyam repertory. His student, Sucheta Bhide, presented an evening of Bharata Natyam with Marathi lyrics. Another innovation attempted recently was with renderings in Hindi of the original lyrics in Telugu or Kannada set to Hindustani ragas and talas. An experienced Gujarati-speaking teacher of Bharata Natyam tried this with the help of the noted Sarangi player, Pandit Ram Narayan.

An important feature of the dance scene is the emergence on the national stage of the two scintillating dance styles of Odissi and Kuchipudi. Their clientele is growing; it is too early to expect any innovations in these dance forms. When people crave for a change in the repertoire, artistes will have to rise to the occasion

Theatre Scene

In the Indian cultural tradition, theatre occupies a pivotal place for around it have grown all other forms of plastic and performing arts. The Natya Shastra boasts that "there is no knowledge, no craft, no lore, no art, no technique and no activity" beyond theatre If it is by the comprehensive art of theatre that a society is judged at the bar of history, India emerges in flying colours for it is in this land that man's imagination and creativity in play-writing reached the pinnacle

However, the classical theatre 'suffered from certain inhibitions' which makes it obsolete in the modern context. The weight of tradition did not allow Indian theatre to keep pace with times either in content or form, as the *lokanucharita* aspect was ignored by later playwrights When the Indian playwrights felt the fresh breeze of contemporaneity from outside, they were thrilled and began to react, though in an immature way. They required intellectual and technical guidance with a firm indigenous base. Several schools and workshops were conducted to help them The National School of Drama, set up by the Sangeet Natak Akademi, was the most important institution. Systematic training in theory and practice of drama in its various departments is given to theatre enthusiasts. Many plays written and produced by the National School have become trend setters in Indian theatre.

The School has been rendering into Hindi many important contemporary plays from regional languages and presenting them with the object of creating an awareness of contemporaneity among all those connected with theatre. The School also introduce major folk drama forms – indigenous as well as foreign. Karnataka's folk theatre, Yakshagana, and the Japanese Kabuki drama were presented in Hindi with the assistance of experts concerned.

Experimentation in play construction as well as presentation technique is the *in* thing now. Our playwrights turn the spotlight on the dark recesses of human mind and heart to attempt intimate analyses of subjective responses in the context of complex modern living And psychic subjects demand somewhat psychedelic stage treatment Indeed, the whole philosophy of working on a play either at the desk or on the stage has undergone great change.

What is more significant is that a powerful play written in Bengali or Marathi, Kannada or Tamil is no more confined to regional appreciation only; nearly all major works of drama in regional languages have been rendered into Hindi and other languages and staged using lively, authentic and abiding production techniques.

Yamini Krishnamurty, in a Bharata Natyam pose.

A scene from Jaishankar Prasad's famous poem 'Kamayani' produced by Anamika, Calcutta

Kogga Kamath and his troupe presenting Yakshagana puppet play

The exploitation of folk theatre idiom for modern dramatic expression is another significant development. Playwrights of eminence such as Badal Sircar, Mohit Chattopadhyaya, Laxminarayan Lal, Dharmavir Bharati, Girish Karnad, Vijay Tendulkar and Habib Tanvir have employed folk elements with considerable success. Habib Tanvir's greatest contribution to contemporary theatre is his introduction of folk balladists as theatre artistes. Puna Ram and his group from Chattisgarh in Madhya Pradesh are now theatre celebrities in Delhi having successfully staged two or three performances.

'Theatre-on-wheels' is another novel innovation of Habib Tanvir. The mobile theatre consisted of a stage mounted on a motor truck which moved from one street corner to another presenting rollicking skits on the political situation in the country.

Students and youth have always sustained the theatre movement with great enthusiasm and dedication and with whatever intellectual or material resources they could command. In the new cultural climate, they are exposed to contemporary styles of play writing and production. And whatever is attempted intelligently has the backing of state agencies. Theatre festivals are organised each year where artistic achievement is rewarded and recognised

Time was when grave fears were expressed about the future of art tradition in the country owing on the one hand to languishing patronage and popularity of technology-based entertainment on the other. It is a miracle indeed that the situation has changed to the advantage of the indigenous arts which have gained strength and prestige and widened their appeal. I remember what the noted Marathi playwright producer P, L. Deshpande has said in one of his works. A Bombay art lover who wishes to witness a performance of *tamasha*, goes all the way to a far village, which is a traditional centre of the art form, only to be told that all the best troups had migrated to the city.

Plastic and Visual arts

The two Triennales of contemporary world art held in 1968 and 1971 provided a great opportunity to Indian artists to study world art trends.

A scene from *Dhola maru*, A dance drama produced by the Bhartiya Lok Kala Mandal, Udaipur

A scene from Ramayana ballet presented by Little Ballet Troup.

The growth of art galleries and the increase in art exhibitions is phenomenal which are indicators of the swelling numbers of painters and sculptors as also art lovers. The Lalit Kala Akademi sponsors national exhibition of art and operates the Artists' Aid Fund for the benefit of indigent artists. A ten per cent cut from the sale proceeds of paintings is pooled into the Fund The Akademi organises artists' camps where members meet, work and exchange views.

The unique artists' village Cholamandal near Madras where artists live and work in a community is an important development in the field of art. The Akademi promotes such artists' colonies.

The artist cannot be an island unto himself; he has to react and respond to the call of the hour, he has to play his role as a leader of public opinion. What ever he creates must mirror the social situation. During a calamity, during emergency the artist must help to foster the necessary emotional climate And our artists have not lagged behind; they roused the conscience of the nation in times of stress and strain.

Film has emerged as an important medium of cultural advancement. The trend of film making in the past few years has been towards increasing involvement in social affairs. The New Cinema pioneered by young film makers from the Film and Television Institute has done signal service in inculcating a sense of sanity among commercial film producers The film society movement has gained momentum and has been providing support to the parallel cinema. The national and international festivals of films have been instrumental in opening up new vistas of cinematic expression.

Having rediscovered itself Indian art has to jostle in the open with the art of other lands, but let us not forget those very wellknown words of Gandhiji: "I want the doors and windows of my house to allow the air of all cultures to blow and yet I do not want to be blown off my own feet " ☐

RRL Jammu

(*Contd from Page* 10)

worthy that complete sophisticated submerged fermentation plant of 4000 litre capacity has been designed, fabricated and installed by the laboratory engineers themselves. The heart of the plant is the fermenter, which is a highly complex unit requiring various key parameters to be controlled during the process for a prolonged period of time This laboratory is perhaps the first in India to undertake such a large fermentation plant on a turnkey basis.

Export of Know-How

—RRL Jammu has now entered the field of exporting its technical knowhow. In that connection laboratory technology is now being exploited for Indo-Burmese Scientific Collaboration Programme. The delsigning and fabrication of the plant-foi producing 3000 kgs of menthol per annum under this project has been done by the laboratory.

The laboratory has also successfully cultivated hops in Kashmir and Himachal Pradesh. A project is now being taken up on commercial basis, by many breweries and farmers in Kashmir and Himachal Pradesh under the supervision of the laboratory. Hops is used by breweries and India imports rupees one crore worth of hops annually

Laboratory has also done a lot of research in mushroom cultivation in trays and preparation of quality spawn Mushroom cultivation has become almost a household affair in Kashmir valley.

About two and a half years back the laboratory had started transfer of technology to industrialists and it has made an impressive progress. Whereas RRL earned Rs 85,000 for transfer of technology during 1974 the amount jumped to Rs 3.22 lakh during 1975 and increased still further to Rs 6.20 lakh during 1976. An interesting paradox to be remarked in this sphere is that whereas the earnings of the RRL on account of transfer of technology have increased remarkably during the last three years, the number of projects handled by it has not shown much variation. It was 27 in 1974, 31 in 1975 and was 32 in 1976. But what is more important is that laboratory has been taking up more and more important projects resulting in increase in its income.

Two other important projects taken up by the laboratory during the past two years pertain to industrial survy of Himachal Pradesh and a detailed study of the problems faced by small industries in J&K and the hlep that can be rendered by this or other national laboratories under the Council of Scientific and Industrial Research and spread of laboratory technology in the rural areas in these two states. ☐

KILLICK HALCO DRILLS...

OPEN CAST MINING

KILLICK-HALCO, the pioneers who literally 'broke new ground' in the Indian drilling industry, now offer you a complete range of the most advanced drills in the country—on par with the world s best! This success is in no small measure due to our constant research and development, as well as our technical collaboration with the world famed Halifax Tool Co Ltd , U K

Take open-cast mining, for instance Here, our drills possess an unbeatable record in reliability and efficiency They have been used in every possible angle and position, at such important mining sites as

I for Iron Ore
N M D C , Salgaocar, Chowgule, Dempo, (Goa) Tata Iron, Indian Iron, Hindustan Steel Bhilai, Rourkela etc

II for Lime Stone
ACC, Birla Cement, J K Cements, Dalmia Cements, Kesram Cements etc

III for Coal
Eastern Coalfields Ltd
Central Coalfields Ltd
Western Coalfields Ltd
Chasnala Coalfields of IISCO
West Bokharo Coalfields of TISCO etc

IV Other Mining Applications, such as in
Hindustan Zinc Ltd
Dalmia Magnesite
Phosphate Mines etc
Bharat Aluminium (Bauxite Mines)

V Construction Projects
Kalinadi Project
Godavari Project
Beas Dam Project

to name a few

Whether it be for open-cast mining, civil engineering applications, prospecting or down-the-hole drilling Killick Halco have the right down-the-hole equipment, backed by complete and reliable after-sales service

For further information why not write to us today?

Spare parts for Drills are readily available on request!

OUR RANGE INCLUDES

HALCO 625 Truck Mounted 6"-6½" dia drilling	HALCO 4" Truck Mounted Self contained waterwell and prospecting machine	HALCO 78 HR 29 HR on tracks	HALCO 400 Track complete with compressor	HALCO 625 Track 6"-6½" dia drilling

Sold and serviced by

ULTIMA/H/50

Power Development in Kerala

C.N.P. NAIR
GEORGE VERGHESE

THE INSTALLED capacity of Kerala's Power system has increased from a meagre 28.5 M.W. in 1950-51 to 881.5 M.W. by 1976— a 31 fold increase in 25 years. This is an outstanding achievement of economic planning in Kerala.

The heavy monsoon and the rapidly falling terrain of the High Ranges of Kerala favour power generation in the region to a great extent. Practical limitations preclude the exploitation of the entire water resources for power development. It is estimated that the hydro-electric potential of the state is 2600 M W at 60 per cent load factor as against 40.000 M W for the country as a whole Load factor is the ratio of the average demand in a period, to the maximum/peak demand in the same period, expressed in percentage Of this, the State have tapped only about 20 per cent of the total potential so far

The establishment of a hydro-electric station at Pallivasal in 1940 marked the beginning of extensive power generation and supply in the State Prior to that only a few towns were electirfied, that too by small Thermal Stations. With the commencement of hydro-electric generation, these stations were abandoned one after another and the power system in the State registered significant progress.

At the beginning of the First Plan, Pallivasal was the only hydro-electric station in the State The transmission and distribution net work was small, but well planned, comprising 910 c. Kms. of 66 k.v lines, 1073 C. Kms. of 11 k.v. lines and 998 C Kms. of low tension lines The total number of consumers was only 28,119 in 1159 towns and villages and the per capita consumption 13 units. Though the Pallivasal station was started with an installed capacity of 13 5 M.W , by the beginning of the First Plan, its capacity had shot up to 28 5 MW.

Out of the total outlay of Rs. 270 million, for the First Plan, the allotment for power development was Rs 118·5 million and the actual expenditure was Rs 112·5 million only. The proposals were to augment the capacity of the Pallivasal Project and to take up new schemes (viz). Sengulam, Poringalkuthu 1st and 2nd stage and the Neriamangalam Project. The extension programme of the Pallivasal Project to boost up its capacity to 37·5 M W and the Sengulam Scheme (48 M.W installed capacity) were commissioned during the Plan itself. Thus, by the end of the Plan, the total installed capacity of the System was 85 5 M W. The transmission and distribution net work and the rural electrification schemes also showed progress during the plan period. The consumer number rose to 79,575 Because of all these the per capita consumption rose to 18 5 kwh

The Kerala State Electricity Board was formed during the Second Five Year Plan period. The total outlay for the State during this plan was Rs. 870 million. Out of this an amount of Rs 234 5 million was provided for power development and the actual expenditure was only Rs. 224 9 million In addition to the spill-over projects, the proposals were to take up the Panniar, Sholayar and Pamba Stage I schemes. Two units of 15 M W. each of the Poringalkuthu Project and the Neriamangalam First and Second stages were completed. Thus the installed capacity of the system rose to 14 75 M W The aim was to complete Panniar and Sholayar Projects also But due to the delay in getting technical sanction for Sholayar Project and foreign exchange relief for the Panniar Project, these were not completed. Though the generation of energy showed an increase of 66% during this period, the end of the plan witnessed a shortage of 6 M.W. in the firm capacity* as against the overall demand for power.

A major portion of the allotment for power was set apart for the expansion of transmission and distribution, and rural electrification. This plan period marked the beginning of 110 k.v. grid in the State Transmission and distribution net work showed fast increase during the period and as a result the number of consumers shot up to 1·75 lakhs and the per capita consumption to 30·10 Kwh.

Out of the total outlay of Rs 1700 million, an amount of Rs 435·6 million was earmarked for power development during the Third Plan Period. The actual expenditure was Rs 608·5 million. The programme of development was chalked with an eye on the long-term requirements of power. The physical programme was mainly the completion of the Panniar, Sholayar and Sabarigiri Projects. Kuttiadi Project was also taken up during this Plan.

The third Unit of the Neriamangalam station with an installed capacity of 15 M.W. and the Panniar Project with 30 M W. capacity were completed Thus the installed capacity of the system increased to 192·5 M W. Though the installed capacity increased by 45 M W., the firm capacity rose only by 4 M W. Hence the shortage was continuing throughout the Plan. The outstripped demand for power was partly met by purchasing it from the neighbouring state—Tamil Nadu. Generation of power increased from 582 million units to 842 m units and the per capita consumption to 45 units.

The allotment for transmission and distribution and rural electrification was Rs 55 million and Rs 40 million respectively, but the actual expendityre were Rs 76.4 million and Rs 23 3 million

The total expenditure for power development during the Annual Plan periods was Rs 418 8 million. During this period, the Sabarigiri and Sholayar Projects were commissioned. As a result, the installed capacity of the system rose to 546·5 M W. and the annual power generation reached 1623 m. units. The generating capacity of the system become safe and hence more attention could be diverted to transmission and distribution

During these periods, a crash programme on T & D was launched. This enabled to increase the number of consumers from 1·75 lahks to 3·87 lahks and the centres electrified from

---

Dr. Nair and Mr Verghese belong to the Deptt. of Commerce and Management Studies, Calicut University

* Firm Capacity is the capacity of the power project to generate energy for 70% of the time in a year. This is calculated on the basis of the water availability

869 to 1119. The per capita consumption reached 66·9 Kwh.

The policy of the Government and the Board regarding power development in the Fourth Plan was to increase the generating capacity further, assuming that supply of cheap power will induce industrial development in the State. Out of the total plan outlay of Rs. 2584 million an amount of Rs 762·5 million (later revised to 3307·0 and 1138 1 million respectively) was allotted for power development. Actual expenditure was Rs. 1146 million. During this period the work of Kuttiadi Hydro-electric Project was completed raising the installed capacity of the system to 621·5 M.W. The aim was to complete Idikki Project too, but it could not be done. The proposal was to electrify all the 1573 villages in the State, but only 1375 were electrified owing to paucity of funds. The total number of consumers reached 7 84 lakhs and the per capita consumption was raised to 79 units.

The proposed outlay for power under the state sector, in the Fifth Plan was to the tune of Rs 1200 million. The strategy adopted for this plan also was to expand the generating capacity further. Two units of 130 M.W. each of the Idikki Project were completed and thus the installed capacity reached to 881.5 M.W.

From the above analysis, it is clear that a considerable portion of the total outlay was allotted for power development in each plan. It is also clear that, though there were pitfalls in achieving the programmed additions during the plans, there was considerable expansion in the generating capacity. But it should be remembered that the increase in the generating capacity alone is not sufficient.

The general duty assigned to the Board as per the Electricity (Supply) Act. 1948, is to promote the coordinated development of the generation, supply and distribution of electricity within the State, in the most efficient and economical manner. The Board, through which the planned activities are carried out, has succeeded in performing its duty as regards to generation, but can that be said in the case of supply and distribution?

It is true that Kerala is selling power to its neighbouring States, but at the same time it is unable to do justice to the demand at home. As per a statement made recently by the Minister for Electricity of the State, there were nearly 40.000 pending applications for supply of power in the State. The main reason for this as per the statements of the Board, is the shortage of funds and hence the lack of materials for the execution of the work.

Analysis of the various studies shows that the main reason for this state of affair is the insufficient attention given by the Board on transmission & distribution. The 'Energy Survey Committee of India, stated that the capital expenditure on transmission and distribution should be more or less equal to that of generation schemes. The Report of the One Man Enquiry Commission* on transmission and distribution of the K.S.E.B. clearly states that,

"In the Kerala Power system with a compact transmission scheme having close proximity to the power stations, the expenditure on the transmission portion would be comparatively low but the distribution works required are more or less the same as anywhere else. The cost of distribution required for the full utilisation of the power satisfactor will vary from 50 to 60 per ce of the capital expenditure of the corresponding generati schemes."

Till the formation of the Board 1757, the main attention of the G vernment was on the generation pr jects. The expenditure on gene tion schemes upto this period w Rs. 233.7 million whereas on T& schemes was only 15.5 millio During the II Plan this attitude w changed and the expenditure we Rs. 88.4 million and Rs. 100-5 million respectively. But aga from III Plan onwards, ma attention was diverted to the dev lopment of generating capacit Until the completion of the Sabarig Project in 1967-68, there was shor age of power in the state, so t high expenditure on generation ca be justified. With the commissio ing of this project, Kerala has b come and still continues as a surpl state for power. Even at this stag the Board and the Government a more interested in increasing t generating capacity further.

In short we can say that the T& network is to be enlarged furth in relation to that of generatio With the completion of Idikki v will be in a much better position an hence the attention can be diverte to T&D. This does not mean th the generation works are to be stop ed. Of course the generation has t be developed ahead of the deman because of the long gestatio period. But the allotment should b so made that by the completion o the Project work, the necessary wor for the transmission and distribu tion of the generated electricity als are completed. This will hel full utilisation of the generating capa city immediately on completion o the project work. □

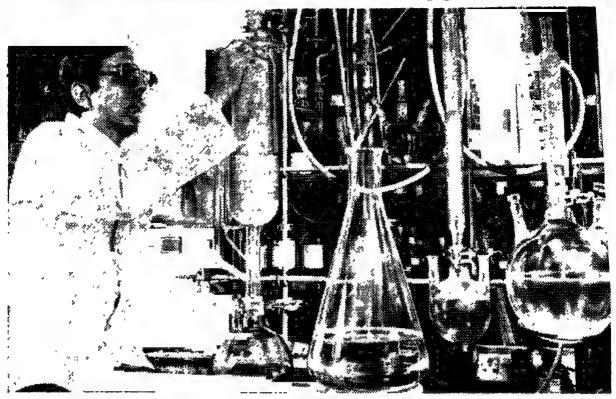
Distribution Lines	3687	8899	14189	16952	25970
Per capita consumption (Kwh)	18.50	30.10	39.5	66.9	79.0

"We shall leave no seed untapped."


Hindustan Lever Research and Technology have added lakhs of tonnes to our oil resources by exploring unconventional and neglected oilseeds.

Vegetable oil is a major source of nutrition, especially for the vulnerable sections of society. Yet, in India, the average consumption per head is only one-sixth of the minimum nutritional standard.

This shortage of fats inspired research by Hindustan Lever scientists into the chemistry of several unconventional oils—castor, linseed, sal, neem, kusum, karanja, ricebran, etc. More than a decade of research has enabled us to modify and upgrade them for use in soapmaking and thereby release for human consumption lakhs of tonnes of edible oils which would otherwise be used in soapmaking.

As most of these oilseeds are grown in backward areas, it brings employment and income where it is most needed.

And without this breakthrough, the country would have been importing tallow for soapmaking. Import saving on this account alone exceeds Rs. 10 crores per annum.

Research creates technology that is relevant to India's needs—better nutrition, income in backward areas and import saving.

Hindustan Lever have won the coveted Sir P.C. Ray Award for "outstanding contribution in the development of indigenous technology in the processing and harnessing of non-traditional oils."

YOUR OWN R&D IS THE KEY

IVAN IVANOV

A BUFFALO DRAGGING a wooden plough as the man behind it gazes at a jet in the sky.... A cliche, perhaps, but illustrative of how far apart technologically are the poles of our turbulent society.

Statistically, the developing countries account for only about two per cent of the world's total research and development (R&D) and produce only one per cent of original technological innovations Most of them are still in the stage of the first industrial revolution which western countries went through about two centuries ago.

This gap, in both time and extent, has serious implications. It often prevents technology from exploiting sources of growth in those countries, perpetuates their technological dependence, impedes efforts for industrialization and inhibits the economy as a whole, inducing a state of mind in which the Third World wonders where the next economic blow is going to fall

Accordingly, technological issues are now of increasing importance in the restructuring of international economic relations. Some major political decisions, intended to correct existing inequalities in this area, have already been made in the main international bodies

The history of modern technology shows, however, that any such gap cannot be bridged by a single attack For their proper implementation, these original political decisions have to be followed up by intensive and unremitting endeavour.

Not a solution

Until now, these international bodies have concentrated almost exclusively on transfer of technology from advanced to developing areas However important, this transfer as such is not the universal solution for eliminating technical backwardness.

It implies continuation to a large extent of current dependence on external technology. If so, the developing countries' bill for imported technology, now three to five billion dollars annually, may well be 20 to 30 times that by the end of the century.

Can the Third World afford such a burden? It seems obvious the future will require that imported technology be supplemented by a growing proportion of indigenous technology as the only sound basis for attaining those countries' industrialization goals set out in the Lima Declaration.

And what constitutes reliable local sources of technology where the Third World is concerned? A visionary like Erich von Daniken may persistently argue that the *Chariots of the Gods* are about to come once again and enrich our remote planet with a new generation of extra-terrestrial innovations and social values For human beings, however–leaving science fiction aside-indigenous technology comes only by strengthening national technological capacity. This means developing countries must invest enough "seed money" in their domestic R&D infrastructure.

Such a strengthening is deserving of at least the same priority in both national and international programmes as is now attached to the much-publicized transfer.

Soviet experience

The proof of this is the experience of my own country. Sixty years ago. just after the Revolution, it was like the contemporary world on a smaller scale. The relatively advanced centre was surrounded by vast poor areas (Central Asia, Siberia, Far East and North, even the Caucasus) possessing practic no other "technology" than nat handicrafts

So, simultaneously with the tra fer of technology from the cent numerous and determined effo were made to establish universit in the capital of every Soviet public and to provide R&D a training facilities. Local academ of science were among the fi agencies set up next to local gove ments.

Today, these former technolo cal "outskrits" produce about per cent of innovations and 30 p cent of our industrial expor Above all, being indigenous, t technology has really been dire ed to their specific developme goals. This is why, at UNCTA IV in Nairobi last year, our deleg tion fully supported the resoluti on "strengthening the technologic capacity of developing countries This recommends that technolo planning be an integral part national development.

It may, of course, be argued th imported technology is now necessity for all countries, how ever big they are, because of th ever-growing international divisio of labour in the R&D area. It i true that, by its nature, moder science is an international pheno menon and it would be unwise fo any country to shut itself off fro outside developments.

In fact only two countries, th United States and Switzerland, ar permanent net exporters of techno logy. We in the USSR, while prou of the fact that we have about quarter of the world's scientists do not forget that the other thre quarters are beyond our frontiers

This, however, in no way di minishes the crucial importance o our national technological capacity With such a base, we are well placed, in importing technology, to make our own choice and to use imports only for supplementing our indigenous R&D output, In commercial terms, this means a healthy ability to reduce the quantity of imported technology and the technical assistance for making it operative, to increase the "local content" in engineering, consulting and other related services and supply of components, and to pay for imports, at least partly, by exporting our own technology, innovations and equipment. In short, this means increased bargaining power vis-a-vis foreign suppliers and, consequently, better terms for our technological imports.

Dr. Ivan Ivanov is Chief, Economics Division, Institute of US and Canadian Studies, Moscow. He has worked recently as an UNCTAD Consultant.

The majority of developing countries, certainly, are still a long way from being able to hold such a "negotiation card". But the most advanced of them (Brazil, Mexico, India, Iran, etc.), relying on the national R&D infrastructure already implanted, can, reportedly, even now apply such an import policy, at least in selected industries. This underlines how imperative it is for the Third World to be, as far as is feasible, technologically selfreliant in attaining its economic independence. International co-operation between developing countries can equally be directed to this end

A certain caution is called for, however, in the approach to practical interpretation of this often-mentioned aim Many scholars, in both developing and developed countries, see this self-reliance mainly as a way of dispensing with imports of "high technology"—and their social consequences—and using instead an "intermediate" technology, one that is labour-intensive and simple in application

One can cite, for example, the discussion in the NGO's newspaper *cosmos*, published during the UNCTAD conference in Nairobi, when some of the writers recommended that a country such as India should rely on local bio gas installations (producing gas from excrements) rather than on modern power stations.

It cannot be denied, of course, that introducing modern technology into a developing country, with unemployment and a deficiency of specialists, is far from being an easy matter, or that technological and social policies ought to be closely integrated. An "intermediate" approach, however, is pregnant with the danger that the present drastic technological disparity between developed and developing countries will become even greater, in time and dimension, so that, in this area, the latter are almost permanently handicapped. Both imported and indigenous technology can and should be suitably adapted to local needs. But "intermediate" versions are not conducive to economic growth and may indeed represent a step backwards from the desired goals.

It is interesting also to note that the developed market economies experienced similar concerns in their history, marked by decreased employment and the spectacle of workers in revolt against machines. The earliest was the so-called Luddites' movement directed against the "jenny" semi-automatic spinning machine in Britain's textile industry. More mature assessment has shown, however, that the source of evil was not the machines themselves but rather their profit-seeking utilization in a market economy.

Similarly, advanced technology is equally not an evil in itself. The problems it is now creating in developing economies are partly inherited from the colonial past and partly a result of recent efforts to transform their traditional structures in accordance with the classical pattern of "free market economy" No wonder that in such transformation the developing countries concerned suffer from its characteristic errors This is why the search for alternative ways of social development is widespread in the Third World, including careful study of the experiences of the Socialist countries with their planned interrelationship between technological and social goals

The above in no way implies that international transfer of technology by itself is to be underestimated Under present circumstances, it will, for a long time to come, be the main source of technological input for most of the Third World. Therefore, its principal terms and conditions must also be carefully examined and, if necessary, modified in order to turn them to proper use

Such restructuring may be directed to using imports not just as a channel for acquiring foreign technology but, simultaneously, as an instrument for stimulating the creation of indigenous technology. The examination may well start with the existing composition of the technology under transfer.

Where recipient developing countries are concerned, even for turn-key projects, this technology is at present comprised of merely operational elements designed for production but not for carrying out R&D. Deliberately or inadvertently, this means that recipient enterprises are "pre-programmed" never to be technologically self-reliant but to continue to purchase from the supplier every future generation of the technology involved.

This inborn weakness can be rectified if transfer contracts are made to cover the setting up of laboratories, pilot and training facilities, so that the imported technology can serve as a threshold for further progress on the spot.

This progressive approach is illustrated by recent Japanese technological imports. The original semi-conductors and television licences bought from the United States have been used for Japan's own mighty break-through to dominating the world market in household electronics.

We in the USSR generally insist that R&D facilities be supplied together with the production lines. This enabled us, for example, after manufacturing our first Fiat-type car, to design five new models of our own in the following four years for domestic and foreign markets, including the well-known "Lada". A bit more expensive initially but far more useful, this system may also interest recipient developing countries

A transfer agreement may be a rather vague arrangement without precise definition of the institutional and contractual framework. In particular, a recipient enterprise in a developing country may be either a national corporation The latter eventuality, no matter how well presented, gives the host country reason for concern

The technology transferred, even if being paid for, remains foreign property and cannot be passed on among local enterprises It is not necessarily suited to national goals and priorities Affiliates seldom possess R&D capabilities and can neither produce indigenous technology nor export it back. They function only to generate revenue

This is especially true in the case of the United States whose transnational corporations spend only about four per cent of their total R&D funds abroad Even in such a technologically advanced country as the Federal Republic of Germany, US affiliates have a negative balance of five to 500 in their international technological exchange, against two to three for national enterprises.

Affiliates under foreign ownership and control are rather dubious channels for transfer of technology. Its acquisition through national firms appears to be more efficient.

No transfer of technology to developing countries can contribute to their progress if it is accompanied by a reverse flow of their national specialists to developed market economies. While demonstrating—contrary to the tenets of racial prejudice—that people in developing countries are as clever as any others, this brain drain deprives the developing nations of the chance of building their own essential scientific staff The phenomenon (*contd on Page* 36)

WEALTH FROM WASTE

Food Cellulose Waste

M.M.S. KARKI

India produces enormous quantities of cellulose which is a potential source of food. But the problem of converting it into metabolizable sugar that would be economically competitive still requires to be tackled.

THE WORLD PRODUCES about 25 billion tonnes of cellulose annually Ubiquitous in nature, cellulose can be a potential source of food. It is a complex compound consisting of 3,000 or more glucose units and is not very different chemically from other carbohydrates Thus, it can be upgraded for human or more effectively animal nutrition.

So far cellulose is nondigestible by man, though it plays an important role in human digestive system The presence of celluloses, also called 'fibre' or 'roughage', in the diet is necessary for the mechanics of digestion and elimination of waste. The contraction of the muscular wall of the digestive organs is stimulated by the fibre, thus counteracting the tendency to constipation

Opportunities for introducing simple innovations in converting cellulose into food material can be many A few are presented here: (i) preparation of protein from leaves and similar materials, called leaf protein concentrate (LPC), (ii) growing protein producing organisms on the digested material, or coverting cellulose into soluble nutrient sugars for use as a food material for mankind, or for making alcohol, using appropriate enzymes for the purpose, and (iii) manipulation of the genetics of *Escherichica Coli*—a common gut bacterium in humans—to produce a strain that can convert undigestive cellulose into assimilable sugars and fatty acids In fact, the first two techniques are being exploited to a limited extent.

Leaf Protein Concentrate

There is an enormous untapped source of food in leaves, grasses, and waterweeds, which is currently utilized only as animal feeds Scientists opine that the world's 26,000 million hectares of meadows and pastures represent a vast source of protein. The nutritional value of LPC is superior to soyabean and other seed protein and almost equal to that of milk protein, says Dr. George Khohler, an American scientist. However, there are some unresolved questions concerning the digestibility of some LPC's by animals and human infants

The preparation of LPC is relatively simple The vegetable material is pulped with an excess of water, the juice pressed from the insoluble residue, and the protein precipitated by heating with or without acidification The resulting press cake is dark green because of its high chlorophyll content and includes 40 per cent dry matter, which is 60 to 70 per cent protein. Improvement of the colour and flavour of the cake requires extraction of the chlorophyll and lipid with an organic solvent The economics of the process in general depends on the cost of collection and transportation of raw materials, availability of cheap electricity or fuel and potable water

Single-Cell Protein, Sugars and Alcohol

One area in which both the developed and developing countries are active, is that of the production of microbial or single-cell protein (SCP). SCP refers to any crude or refined source of protein from unicellular or simple multicellular organisms, such as bacteria, yeast, fungi, and algae. These micro-organisms are grown on easily obtainable and utilizable materials such as bagasse (sugar refuse), molasses, animal feeds, petroleum waste, industrial waste, dairy waste, into animal feeds, and as a likely replacement for skimmed milk, it could also be used for human consumption when both animal and vegetable protein is scarce.

Unlike petroleum, which is a fossil fuel, cellulose is available from all plant sources and is constantly produced with the growth of plant, from the energy of sun through photosynthesis It would, therefore, be worthwhile to try it as a major source of SCP. In fact, experiments for producing SCP and edible carbohydrates from cellulose for animal feed are in progress in USA In one such experiment a few proteins have been developed by fermenting insoluble cellulose with bacteria An experiment on bagasse has resulted in a light-brown to yellow powder with a crude protein content from 50 to 60 per cent. Dr W. Dexter Bellamy, a New York scientist, has discovered that with the help of bacteria useless waste can be transformed into protein-rich animal fodder. He has already experimented with 140 colonies of various one-celled bacteria which can digest cellulose and other chemical compounds found in garbage. He has isolated a kind of bacteria that digests cellulose rapidly, reproduces quickly, and leaves an organic mass with high protein content He says that he sees no insurmountable problems in raising large bacterial populations, harvesting from them huge quantities of protein and giving it forms and flavour which animal would prefer

Cellulose can be turned into SCP either directly or after its enzymic hydrolysis to glucose followed by growth of suitable organisms on glucose.

Cellulose consists of glucose molecules linked in such a way that it cannot be easily broken. It can,

processing to get into a form suitable for use as food. Cellulose is therefore, a somewhat difficult form to be utilized as a substitute for growing micro-organisms under controlled conditions and generating desirable products However, as indicated in the preceding paragraph, the production of good quality SCP from cellulosic waste proved technically feasible

This involves the isolation and development of microorganisms capable of producing highly active cellulases, the enzymes to convert cellulose into sugars. Recent efforts on these lines have been greatly improved by the isolation of such cellulose-digesting enzymes from bacteria and fungi and fixing them on suitable media for continuous use for many days. *Trichoderma virde* has been the most promising among the many fungi studied for their cellulase production A prior chemical alkali treatment, before enzymes digestion, improves yield Yeasts or bacterial strains also need to be found which would easily grow on sugars derived from celluloses. The digested material can also serve as the medium for the growth of several different organisms and for the production of very large quantities of alcohol Cellulase-digested cellulose can therefore, lead to production of thousands of tonnes of materials. Even, it could be used as a raw material for nitrogen fixing micro-organisms so that very large quantities of fertilizer could be produced through nitrogen fixation.

In India, two groups of researchers are known to be engaged in this field. One is led by Dr V. Jagannathan, of National Chemical Laboratory (NCL) Pune. Dr. Jagannathan has been successful in isolating cellulases which can break cellulose conveniently. This is an inter-laboratory project, sponsored by CSIR in collaboration with Central Food Technological Institute (CFTRI), Mysore and Indian Institute of Science (IIS) Bangalore. Prof. Tarun K. Gosh of Indian Institute of Technology (IIT) New Delhi, has the pioneering role in another one. This group has been successful in producing glucose syrup And projection for a small commercial unit has been made They have also produced ethyl alcohol from cellulose like rice husk, jute sticks, corn cobs and paper pulp

However, there are many problems which need a solution before anticipating a major breakthrough. The main problem is the conversion of cellulose to metabolizable sugar in a manner that would be economically competitive with more readily available fermentable carbohydrates Grinding of cellulose into a fine slurry is the heart of the process Therefore, the essential steps of grinding require very detailed study The economic use of cellulose to generating food material also needs consideration. Cellulose hardly occurs in nature as a pure material, except in cotton. Impure cellulose material, which is more resistant an d complex, needs chemical processing to get a reasonably pure cellulose And so far microbic digestion has not been successfully developed for this treatment. The only convenient and reasonably lowpriced material is waste paper, but even here the cost is pretty high to expect production of a low-priced glucose syrup.

Another handicap is the conversion of the soluble light syrup into a solid form or stable product if it is to be used as a good material for mankind. Where it is to be converted into SCP directly, there may be no technical difficulties. To convert such soluble carbohydrates into alchohol for energy use is too farfetched for a normal situation

Until such time as wastes like bagasse, jute stalks or rice straw can be processed straightway to yield soluble carbohydrates, we may not achieve any breakthrough.

Genetic Manipulation

Digestion of cellulosic material in animals consists largely of fermentation executed by a complex combinations of protozoa and bacteria that are housed in a stomach compartment called rumen. The micro-organisms convert cellulose which is impervious to mammalian digestive enzymes into substances that their host can assimilate If humans could support gut organisms capable of degrading cellulose, they could acquire some of the dietary versatility of ruminants e.g. cattle, sheep and deer

Dr. Hargobind Khorana and his colleagues at the Massachusetts Institute of Technology (MIT) have constructed a gene—the basic unit of heredity—complete with its regulatory mechanisms. They have proved that the gene synthesized by them works by implanting it in a living bacterial cell where it functions as if it were the natural part of the cells heredity

The result of this research opens out several chemically related possibilities that could be brought about by genetic means. The manipulation of the genetics of *Escherichica coli* could be one of them so that it could also do the similar job for humans as the micro-organisms of animal stomach do for their host □

YOUR OWN R & D *(Contd from page 34)*

must be discouraged through international co-operation

These three courses of action can augment the efficiency of technology transfer to developing countries even within its present limits and must not, therefore, be ignored They have been embodied from the outset in Soviet technical assistance. The Socialist countries, for example, helped in setting up R&D and educational facilities in India, Burma, Egypt, Algeria, Iraq, Guinea, Mali, Sudan, Syria, and so on. They do not establish affiliates in the Third World nor do they permit a brain drain

To be fully effective, however, all changes in the composition of, and policies for, transfer of technology have to be supplemented by a favourable international trade policy environment This is why the seventh special session of the General Assembly called upon all states to participate in evolving an international code of conduct on transfer of technology. This work is proceeding in the context of the intergovernmental group of experts convened by UNCTAD.

The final shape of this code is to be determined at a later stage Most of the experts agree, however, that it must provide a set of generally equitable rules and guidelines with the purpose of facilitating the access to technology of all countries, particularly developing ones, with mutual guarantees for suppliers and recipients. Its hard core are those provision srelating to special treatment for developing countries and elimination of restriclive business practices.

To sum up problems in transfer of technology are not easy to resolve This assessment is valid only if it stimulates determination to overcome them The role of science and technology for socio-economic evolution is paramount for all countries, most of all for progress in the Third World.

Being genuinely international by its very nature and origin, technoloby—whether indigenous or imported—has to be enabled to fulfil this role. □

Books

A Gripping Story

The Golden Dawn (Novel) *by Raj Gill; Sterling Publishers, AB/9 Safdarjung Enclave, New Delhi-1100016; Pages* 256; *Rs.* 7.00

RAJ GILL IS the most distinguished of the younger set in Indo English writing. His first novel "The Rape" put him in the front rank of contemporary novelists "The Golden Dawn" is his second novel which vividly projects the vital sense of life with remarkable intellectual maturity and stylistic sophistication. As a well-known journalist he has encyclopaedic knowledge "of rural India as well as the tempo of life in a metropolis" The novel under review, therefoe, gives the flavour of rural life and illustrates lively the social milieu of the people in metropolises.

The main object of art and literature is to restore in us a freshness of vision, a more emotional glamour and more vital sense of life" The same applies to the novel in hand The author derives his inspiration from traditional lore, indigenous customs, and the oral tradition, in a bid to demonstrate indigenous customs, and the oral tradition, in a bid to demonstrate to his reader that India has a culture she can be proud of.

The Golden Dawn is a powerful love story, written with effortless ease, in Lucid and beautiful prose. It tells the "thrilling story of the young couple's escape from the frightening world of gold smuggling Face to face with death, they find strength and solace in their sincere and passionate love for each other." The story is gripping and fascinating One day, a beautiful young school teacher, Sapna, in Delhi was on her way home from school. She got off the bus and started walking What happened thereafter made her life miserable. In her own words: "I hadn't gone fifty paces when a taxi started I don't know why but I suddenly felt very frightened and stopped dead in my tracks. The taxi drew up level with me and its door opened. All that I remember afterwards was that someone grabbed me from behind and before I could scream he had pressed something wet and smelling, sickeningly sweet and strong over my mouth and nose. The copybooks that I was carrying home for correction fell on the ground. So did my hand bag. All I remember is that I was being pressed hard to the floor of the taxi a[nd] then a heavy cover was put over [me] shutting out all light." Then a gr[im] battle for freedom starts to the poi[nt] of bloody holocaust under the whip[ped] up passions in an atmosphere [of] "kill or to be killed."

Obviously the major proble[m] posed by the noval is to expose t[he] seamyside of life. But the auth[or] examines the problem of unde[r] world with compassion. Compa[s]sion without justice becomes sent[i]mentality, and sentimentality b[e]comes cruelty. So compassion d[e]feats itself if it is not subordinate t[o] justice, which says that a crim[e] must be punished, not that com[]passion may condone it. Thus Bil[]ram and Sapna do not accept vio[]lence without protest.

Shakti Pal Kewa

Economic Administration

Economics Planning and Public Administration *by P.R. Dubhashi Somaiya Publications Pvt. Ltd., Bombay, New Delhi; Pages* 150; *Price Rs.* 35.

IN THIS BOOK Shri Dubhashi brings together a series of papers in the areas of economic administration and management In the words of Prof V.K.R.V Rao who has written the forward to the book, Shri Dubhashi is a distinguished member of the Indian Administrative Service and combines in himself both administrative experience and academic interests The reader is treated to a generous evidence of both these. in the presentation of some fourteen essays contained in the book, most of which are reprints of earlier publications in the journal of Public Administration and other periodicals. The essays are broadly divided into three parts covening the areas of economics public administration and economics systems and management of the economic systems.

As a person active in the hurly buly of day-to-day administration, the author's observations on issues of managerial and administrative import are expected to attract wide attention Introducing the book he remarks that the economists's concern is with the economy and the administrator's preoccupation is with the efficiency and that in a planned economy the public administrator has to play the rule of an economist in action. Modern management as the author rightly contends elsewhere is an all inclusive system, drawing for its sus[]tenance and growth skills and tech[]niques from various disciplines no[t] to mention even certain branches o[f] engineering that are increasingl[y] being applied Modern economi[cs] and Economists with their heav[y] leaning on quantitative methods o[n] the other hand are a highly speciali[s]ed lot. To equate public admini[s]tration and management and con[]fine them to the somewhat narrowe[r] limits of economics as a cost-min[i]mising concept, is to flatter neithe[r] the economist nor the administra[]tor. Very correctly, the author ha[s] revealed an urge that is perhap[s] increasingly being shared by o[ur] administrators,

some of the essays particularly i[n] the concluding part of the serie[s] contain repetitive and descripti[ve] material some of which are summa[]rised versions of earlier reports o[f] official and non official committee[s] This could have easily been re[]duced relieving the reader of familia[r] ground. A more rewarding effor[t] however, could be the analysis o[f] instances of case situations whic[h] the author could have well draw[n] up on from his experience to illus[]trate the point of existing adminis[]trative procedures and bureaucra[]tic inhibitions hindering rather tha[n] helping the development process The author, understandably crit[i]cal of certain aspects of plannin[g] has identified some gaps in the plan[n]ing process especially at the regio[]nal and district levels of adminis[]tration. The absence of scientif[ic] methods at the subnational level

sources and evaluation of plan implementation are some of the more important aspects referred to. The writings, however, published as they were some years back lack relevance to more recent planning efforts and need to be updated in their supporting evidence. Important and qualitative changes that have been introduced in the planning process more place of aggregative and sectoral approach, funding on the basis of rigidly formulated implementation schedules including PERT charts as a part of routine Annual Plan exercises rapid expansion of growth centres and the growing provision for spatial concepts in area planning, to mention a few merit greater attention together, the collection of essays presented in the book should help the process of rebirth that our administrators have to undergo to fit in with the new role that is required to be played in the present context of change.

—K.S.V. Sanjeeva Rao

Monetary Principles

Monetary and International Economics *by K.P Sundaram; Sultan Chand and Sons, 4772/23 Daryaganj, New Delhi; Pages 550; Price Rs. 15.*

THE BOOK WRITTEN by Prof. K.P M Sundaram has already earned distinction and popularity. In the fourteenth revised edition the book has been made more informative. Sri Sundaram has tried to present a broad coverage of the principles of monetary and international economics at a level suitable for the undergraduates The book has been divided into five chapters; monetary economics, Keynesian economics, banking, international trade and exchange, Indian currency and banking.

Part I deals with the evolution of money, the currency system, valuation of money etc. In part II Prof Sundaram has tried to present a simplistic view of Keynesian Economics and in this attempt he fails miserably since Keynesian theory is tightly knotted with the cords of incomprehension and confusion and any attempt to unfold the same quickly and in a too simple manner would fail inevitably. In the subsequent chapters the author has incorporated the latest changes in Banking theory and foreign exchange and in addition, rightly too, these chapters are floodded with statistics to support the academic point of view

The aim of the author as to provide a comprehensive and elementary knowledge of all aspects of monetary and international economics has been fulfilled to a large extent It is eminently suitable as text book for students of Economics.

—V. Suryprakasa Rao

Planning Strategy

(*Contd From Page —5*)

of the Plan. Any how it is estimated that the number of unemployed would be nearabout 29 million at present. According to the estimates of Central Employment Directorate the number of unemployed and underemployed is likely to be 60 million and 300 million respectively by the end of the Fifth Plan period i.e. 1978 79

This grave problem must be given top priority if Planning is to survive in the country It requires a fundamental change in the pattern of investment. These investments have to be directed away from capital intensive industries to those industries which can provide maximum employment opportunities. We have to shift the production to those items of consumer goods which form the wage goods. The maximum emphasis is to be given to small scale enterprises It would be worthwhile to restrict the large scale industry for exports and defence only. The domestic market must be completely left to small scale sector and here also the amount of capital should not be more than five lakhs.

A large part of rural unemployed population can be gainfully employed through extensive redistribution of land, through land reforms and direction of credit facilities in favour of the poorest section of the society.

The present strategy is concentrattrating investments in urban areas, with the result that small minority is getting its benefits. The rural area where 80 per cent of the population lives is starved of resources. The benefit of investment carried out in the agricultural sector, such as for extension services, credit, irrigation and roads has been taken away by the large and prosperous farmers. The gap in the level of income is widening continuously between the prosperous farmers and the landless labour or marginal farmers The lopsided development is the main cause of rapid increase in unemployment and underemployment Unless the process is reversed, there is hardly any hope of improvement in the situation of unemployment. □

Development Notes

More Employment in Rural Areas

The Union Ministry of Agriculture and Irrigation has launched a scheme for the generation of additional employment opportunities in rural areas, under which part of the wages to the workers will be paid in the form of foodgrains. The scheme aims at augmenting investment on the maintenance of rural works in States. Under the scheme the Central Government will make available the agreed quantities of wheat and milo to the states without cost.

This additional employment potential on the maintenance of public works is designed to be utilised in the lean period when rural employment is at a low ebb of about 4 months. The categories of works, which will be eligible for assistance under this scheme are major, medium and minor irrigation works; flood control embankments, soil and water conservation works, afforestation and rural roads. The scheme combines three important aspects of economic activity, viz, relief of seasonal unemployment or underemployment, improvement of rural assets and utilisation of food reserves.

Pipeline Completed Ahead of Schedule

Oil India Limited (OIL) has completed ahead of schedule, the laying of 212 kilometre loop pipeline to pump crude oil to the Bongaigaon refinery, which is fast nearing completion.

The construction contract for this project had been entrusted to Engineering Projects (India) Limited (EPIL), and Engineers India Limited (EIL) was awarded the job of preparing the detailed project drawings, while the management and supervision of the project remained with OIL. Work on this 212 km-long loopline commenced in December 1976 and it was a race against time to complete the project before the 1977 monsoon.

Despite difficult terrain and climatic conditions prevailed in this remote region of Assam OIL and EPIL have been able to complete all major works connected with the project ahead of time. OIL is confident to commence pumping crude oil to Bongaigaon by September 1977, as planned.

OIL has at present the 1,150 km-long Naharkatiya-Barauni pipeline, which transports the crude oil it produces in Assam to the Gauhati and Barauni refineries.

The present loopline was necessitated because of the Government's decision to construct a refinery and petrochemical complex at Bongaigaon to facilitate the transport of this additional crude from Moran to Bongaigaon.

Oil Struck in Cauvery Basin

Oil has been struck for the first time in a self-flowing well in the Cauvery basin. The Oil and Natural Gas Commission (ONGC), began exploratory drilling in the basin over a decade ago. The "strike" in well number 10 at the sleepy village of Titacherry in Karaikkal had an intermittent flow of about one to 1.5 tonne a day. Though there had been traces of oil in some of the 16 other wells drilled by the ONGC they had to be abandoned as commercially not viable. The Cauvery basin, identified for exploratory drilling extends from Pondicherry to the south of Rameshwaram, a stretch of about 480 km. The ONGC will soon begin exploratory drilling in the Gulf of Mannar, about 15 km south of Rameshwaram.

Cost Reduction in Steel Production

The Steel Authority of India has decided to set up value engineering groups to evaluate and assess the potential for effecting cost reduction in steel production. The Indian steel industry, which has of a high degree of sophisticated technology, is poised for the highest ever saleable steel production since independence. Against a target of 6,465 million tonnes of saleable steel set for the current year, production during this financial year was likely to exceed 6.9 million tonnes, about 19 per cent more than last year.

Compared to 1974-75, nearly two million tonnes was available this year, an increase of 40 per cent. In the 11 months of 1976-77 Bhilai and Rourkela exceeded their target for the year by the end of February itself. Durgapur exceeded its production of last year before the end of February. The Durgapur Alloy Steel Plant operated at 121 per cent of the target for saleable steel.

SAIL steel sales rose by 35 per cent till the end of February as compared to the corresponding period last year. Domestic sales from the steel plants showed an increase of 24 per cent over sales during last year. Despite a sharp decline in demand in the international markets, export orders worth Rs 433 crores had been booked till the end of February this year. The actual exports during the year would be of Rs 300 crore against a target of Rs 290 crore fixed earlier.

IDBI Plan to Help Small Units

Eleven State Governments have expressed their concurrence to the guidelines prepared by the Industrial Development Bank of India (IDBI) for the utilisation of the special capital established to help small-scale sector through soft-term loans. The States are Assam, Andhra Pradesh, Gujarat, Jammu and Kashmir, Karnataka, Kerala, Madhya Pradesh, Rajasthan, West Bengal, Manipur and Tripura. Two Union territories—Dadra, Nagar Haveli and Goa, Daman and Diu—have also extended their agreement to the guidelines. IDBI is in touch with other states in connection.

The special class of share capital was set up in February 1976 under the Public Financial Institutions Laws (Amendment) Act 1976 with the aim of enabling the state financial corporations to provide assistance on soft terms to projects in the small-scale sector which are basically viable but which may have difficulties of being implemented because of financial handicap of promoters or because of certain locational disadvantages.

Zinc Smelter Commissioned

The Visakhapatnam Zinc smelter has been commissioned. The lead smelter of this twin zinc lead plant is expected to be commissioned in the second phase by the end of the year. However, with the commissioning of the first phase of the plant, the total zinc smelting capacity in the country has gone up by from 38,000 tonnes to 95,000 tonnes, representing an increase of 57,000 tonnes or 150 per cent of the corresponding period of last year. The smelter, the second of its type in the public sector, is based on imported concentrates, having a total smelting capacity of 30,000 tonnes.

The existing zinc smelter at Debari in Rajasthan was expanded earlier this year to increase its smelting capacity from 18,000 tonnes to 45,000 tonnes. Both by the commissioning of the Vizag smelter and the expansion of the Debari smelter the production of metal is expected to go up to 60,000 by the end of this year, representing an increase of 130 per cent over January-December 1976.

Granite Deal with Italy

The Rajasthan State Industrial and Mineral Development Corporation (RIMDC) has bagged an export order worth Rs 10 million for granite to Italy. The granite purchases will be made by the Italian firm Notali group of industries over a period of five years.

The Italian firm was ready to purchase more from RIMDC if the latter was in a position to meet their requirement. RIMDC would supply 1,250 cubic metres of granite worth Rs 20 lakh to Italy per annum to start with RIMDC has the country's best granite deposits at Jalore in Rajasthan. The granite production was being raised to 4,000 cubic metres per annum from only 50 cubic metres at present. RIMDC would invest about Rs 20 lakh immediately to develop the mines and increase the granite production.

RIMDC has also signed an agreement with Italy for the purchase of sawing, cutting and polishing machines which would be installed at Jodhpur. The order placed was of the order of Rs 16.5 lakh. The new plant, which would greatly boost the production of granite would start working by the end of November.

Keel For a Pioneer Class Ship

Keel for yet another multi-purpose general cargo 21,600 DWT pioneer type vessel has been laid at Hindustan Shipyard Limited, Visakhapatnam.

This ship is the eleventh of the Pioneer type of vessels being built at the Shipyard, and the Third Pioneer type vessel for the Scindia Steam Navigation Company Limited, Bombay. Designed for a speed of 16 knots, this vessel will be fitted with a medium speed propulsion engine developing 9000 BHP. The design of the ship is modified to suit owners' special requirements and the vessel can carry ISO 20 ft. and 40 ft. containers palletised and bulk cargo in the holds as well as in fixed Tween Decks with the arrangement for forklift movements in Tween Decks. So far Hindustan Shipyard has built and delivered 73 ships including small crafts aggregating a cargo carrying capacity of about 6,96,297 tonnes deadweight.

World Bank Loan

The International Development Association (IDA) an affiliate of the World Bank, has approved credit of £ 12 million to help finance a project for expanding agricultural extension services and upgrading of research facilities in West Bengal. The project, through reorganisation and improvements in agricultural extension, research and staff training seeks to provide the means for sustained increases in production. A system of regular farm visits by trained village level workers to encourage the adoption of improved agricultural practices is envisaged under the project

Tractor Company Gets Big Export Order

International Tractor Company of India Ltd. (ITCI) has landed the biggest export order secured by any Indian tractor manufacturing organisation. Valued at over Rs. 10 crore, the order, from Turkey, for 2,500 International Tractor Model '444', was secured against, strong international competition, which included tractor manufacturers from Europe. The order takes effect on receipt of the required permit by the Turkish buyer. This is the third order received from Turkey ITCI has previously exported to Turkey 1,750 tractors valued at Rs 6.5 crore. ITCI has exported tractors and implements to the U.K. Australia, Japan, Indonesia, Kenya, Muscat, Nepal, Tanzania, Turkey, Uruguay and Zambia. The company started production of tractors at its plant near Bombay in 1966 and has so far produced over 60,000 tractors.

Aid For Nepal's Devighat Hydel Project

India will assist Nepal in the construction of the 14 megawatt Devighat hydel project on the Trishuli river which will cost around Rs 35 crore. This is the kingdom's second biggest hydel project on which the work will start soon. The Government of India had already released Rs. 1.4 million for the construction of roads and other services in the area. Nepals' biggest hydel project, the 21-megawatt Trishuli hydel project, has also been built with Indian assistance. It was formally handed over to the Government over a year back The Devighat hydel project which will be meeting Kathmandu's demand for power, will be utilising the tail waters of the Trishuli project.

Big Engineering Contract From Saudi Arabia

Following the major breakthrough provided by Saudi Arabia's virtual gift to India of a contract to build a power generation plant worth Rs 100 crore, official expectations are that engineering contracts valued at a minimum of Rs 600 crore will be obtained annually possibly beginning this year. The initiative for this has been taken by the Association of Indian Engineering Industry (AIEI) which has formulated a two pronged strategy for obtaining contracts on behalf of a consortum of public and private sector firms.

First it will adopt the "direct approach" by bidding for tenders floated by Saudi Arabia and, second, seek sub-contracts from Western consultancy firms engaged by that country to supervise implementation of projects under its $ 1,42,000 million Second Development Plan. Even if India gets less than one per cent of the total contracts from Saudi Arabia - and this is likely in view of the latter's new policy to favour "friendly developing countries" - it should be possible to win $ 1,000 million worth of orders annually. If attained this will solve all the foreign exchange problems of this country.

IDA Credit for Farm Development

A $20 million credit has been sanctioned by the International Development Association (IDA), an affiliate of the World Bank, to finance an agricultural development project in Orissa. Among Indian states, Orissa has the highest percentage of people living in rural areas. The project's main aim is to increase the production of foodgrains by strengthening agricultural extension and related research. Small farmers with limited financial resources but excess labour are expected to benefit greatly from the project's emphasis on efficient use of locally available resources.

Since groundwater resources are very important to agriculture in Orissa both in the short and long-term, the project also includes a three-year programme of extension of geo-hydrologic investigation. The interest free 50-year IDA credit will cover about half of the total cost of the project, estimated at US $ 40 million. The other half will be borne by the Government of Orissa.

Work on Super Thermal Power Unit Begins

Work on the first super thermal power station has commenced near Singrauli in Mirzapur district of Uttar Pradesh. The National Thermal Power Corporation Limited (NTPC), the newly established public sector company will erect and operate the Singrauli as well as all other super thermal power stations proposed to be set up in the central sector. NTPC has successfully completed a wide range of pre-construction and project engineering activities including survey and investigation. Arrangements for a loan of $ 50 million from the World Bank to finance the purchases of major equipment have also been finalised.

The Singrauli super thermal power station, designed for an ultimate generating capacity of 2,000 mw, will involve an estimated capital outlay of over Rs 800 crore including the cost of associated transmission network In the first 600 mw phase the project will have three generating sets of 200 mw at an estimated cost of Rs 255.66 crore and 400-kv transmission system at a cost of Rs 32 crore. The first set is sheduled to be commissioned in 1981, followed by subsequent sets at an interval of six months thereafter.

IDA Finance for the Thermal Plant

A credit of £ 150 million from the International Development Association (IDA) the soft-loan affiliate of the World Bank, will help finance the construction of the first phase of a 2,000 MW thermal power station in India. India's installed power generating capacity, which at the end of 1976 was a little more than 20,000 MW increased at an average annual rate of 10 per cent over the 20 year period beginning 1950. In recent years, however, demand has been considerably greater than the available supply. Plans are afoot to install additional capacity amounting to almost 30,000 MW by March 1984.

The project being assisted by the IDA consists of the construction of the first 600 MW of capacity in the Singrauli thermal power station, together with ancillary equipment and related works, and the 400 KV transmission facilities to convey this power to bulk supply points. The power station will be constructed with supplies from the Singrauli coalfield at Kota. It is expected to reach 2,000 MW capacity by October, 1985. The total Singrauli development including associated transmission, is estimatee to cost about £ 397 million. Implementation of the project will be the responsibility of the National Thermal Power Corporation Limited.

Exports and The New Import Policy

ECONOMIC growth in any country is directly dependent on the progress made in the various sectors of the economy. The progress of the industrial sector is greatly dependent on the timely availability of essential inputs, both domestically produced and imported. The new import policy for 1977-78 announced a few days back, attempts to meet this aspect of the industrial development of the country and expand production to meet the domestic requirements and for exports.

The import policy has been derived from a strategy of integrated economic development. More employment opportunities, rapid expansion of output, supply of essential commodities particularly to the weaker sections of the community, and improvement of the standard of living of the people, are the main objectives of the new policy. *It also aims at optimum utilisation of resources* for achieving growth in production both for domestic use and for export.

Apart from making a number of procedural simplifications, the new policy has liberalised imports by placing a number of items on Open General Licences and free licensing. The main philosophy behind this policy is to make available the essential requirements of the industry as easily as possible and also at internationally competitive prices. Even in the cases, where the imported items are canalised through the *public sector corporations, facility of direct imports* has been allowed. Liberal provisions of import are expected to serve the purpose of better utilisation of the industrial capacity already built up in the country.

In the area of exports, a number of *new innovations* have been introduced in the new import control policy. Firstly, in the case of registered exporters, the "shopping list" which prescribed limits for imports of different inputs has been done away with. Now the exporters would be able to obtain all their import requirements in accordance with their needs for the inputs. This should help in encouraging economy in the use of imported inputs and also economic purchase of imported items and thereby contribute to a reduction in the prices of the items produced. However, care has been taken by fixing limits or placing *certain restrictions on imports* so that the interest of the indigenous producers does not suffer. These restraints are expected to provide the necessary protection to the indigenous industry and create a climate for them to improve both the quality and price of their products.

Although a scheme of duty free import in case of advance licences was in operation for some time, it was not functioning smoothly. The scheme, therefore, has been reframed and now the list covers as many as 94 items, the import of which is allowed without payment of import duty. The advantage to the importer is that he is not required to pay any import duty on the raw materials imported, unless he fails to discharge the obligation imposed on the advance import licence. This is a significant improvement on the earlier situation when importers were required to claim refund of the import duty paid, as in the event even of a 100% refund of import duty it involved costs because of the locking up of funds in the initial stage.

While protecting the interests of the indigenous suppliers of machinery and capital goods etc. the import replenishment licences will now be available for being utilised for import of machinery and spare parts under certain conditions. While in the case of spare parts, the licences can be used for import up to 10% of their value in the case of machinery the full entitlement can be used for import of machinery required for expansion, replacement, balancing, modernisation or research and development.

Imports into the free trade zones at Kandla and Santa Cruz have been further expanded by putting the import of (a) machinery (b) raw materials (c) components (d) spare parts of machinery (e) consumables (f) tools, jigs, ganges and fixtures (g) technical and trade samples on open general licences. The *imports of these items in these zones do not need any import licences.*

Import of some items is canalised through public sector organisations like S.T.C., M.M.T.C., SAIL etc. However, for a number of these items, the exporters are allowed to make direct imports, notwithstanding the fact that the items have been canalised. This has been done to enable the exporters to import their requirements most economically and at internationally competitive prices and to make timely imports in accordance with their requirement for meeting the domestic production schedules and delivery schedules of export orders in hand.

The scheme in respect of export houses has been both revised and simplified. The new scheme will provide greater opportunity to the export houses, to offer merchandising and other services to their supporting manufacturers particularly those in the small scale and cottage industry sectors. The overall objective of the new scheme is that manufacturers, specially in the

(Contd. on page 36)

We Will Make Our Own History

JAYAPRAKASH NARAYAN

MANY FRIENDS have been pressing me in the past few months to say something to the Nation. Being bed-ridden and therefore out of touch with the objective situation in the country, I have been hesitating to say anything.

Only a few days ago, the Prime Minister spoke to the Nation After his excellent discourse, I have thought there was no need for any other voice to be raised. But friends still think that the Prime Minister having spoken as the Head of the Government, there was need for a common citizen like me to speak on behalf of the people.

While I disclaim any authority to speak for the people, I am placing here my views as a common citizen

Students' and People's Movement

The first observation that I should like to make and emphasise is, that the results of the last General Elections were due to the student's and people's movement that had started from Gujarat and spread to Bihar and whose message had resounded throughout the country

The essence of that message was that an elected representative of the people does not necessarily require a right to hold on to his position until the expiry of his legal term

The principle that was asserted during the movement was that when an individual representative, or a representative Government fail in their duty, became corrupt and oppressive and inefficient, the electors, i e the people, had a right to demand their resignation irrespective of the time they may yet have left to service.

The example of ex-President Richard Nixon of the United States, illustrates the proposition I am enunciating here.

It is true that what is called the 'right of recall has no place in our Constitution. But in a democracy, the people have an unwritten right. which they can exercise if and when necessary

Text of Message to the Nation.

All this does not mean that any small number of disgruntled persons have the right to demand an elected representative or Government to step down from office whenever they wish

But it does mean that if it is found beyond any doubt that a vast majority of the people concerned are convinced of the corruption, nepotism and inefficiency of a Government or an elected representative and demand their resignation. the people's voice must prevail

Will of the Majority Must Prevail

It is possible that the party in power, or the individual representative concerned, might also mobilise their supporters, but if there is a genuine people's upsurge against them, democratic ethics and practice require that the will of the people, great majority, must prevail over that of a small minority

To the constitutionalists this may appear to be an anarchic proposition However, it should be remembered that practically every major constitution in the world was drafted in the wake of revolutionary upheavals

This is a good occasion to look back and recall how the students' movement against corruption in Gujarat had assumed an all-India character Political and Governmental corruption was the central point of the people's movement Therefore, it is the duty of those who have come to power in the wake of that movement to take some concrete and effective steps to stop and root out corruption from these spheres

It is my view that just like the High Courts and the Supreme Court, there should be an autonomous institution set up with legal authority and rights both at the Centre and in the States. The Swedish Ombudsman naturally comes to one's mind, but in the Indian conditions some broader kind of institution seems to be necessary.

For instance, at the Centre a body that may be known as Lokpal might be set up consisting of not more than 5 members with powers to hold investigations on their own initiative as well as on the initiative of any citizen or any private or public body.

A group of individual jurists might be entrusted with the task of drawing up a blueprint of such a body and a clause to this effect might be inserted in the Constitution These are my first expectations from the Government

Electoral and Administrative Reforms

The main issue raised by the students'-cum-people's movement was electoral and administrative reforms so as to make elections cheap and truly representative and bring the administration nearer to the people

Another important demand concerns educational reforms so as to relate education to the problems of the country and fit the educated to deal with them. It was also desired that a medium of education should be made universal and illiteracy and ignorance banished from the land.

The Charter of Demands that I placed before the Speaker of the Lok Sabha and the President of the Rajya Sabha on behalf of the people on 6th March, 1975, deserves to be reproduced here so that it may serve as a standard by which to measure the work and functioning of the present government

Except for the Centre, the Congress Governments still continue function in the States. It is necessary as soon as possible to give chance to the people to elect their fresh representatives who would be committed to the People's Charter in addition to their election manifestos.

Faith in 'Total Revolution'

It will be recalled that the ultimate objective of the people's movement was defined by me as Total Revolution. This term 'Total Revolution' was derived by some at that time and brushed aside by

(*Contd. on page* 16)

All developing countries face the problem of balance of payments. Export earnings have immediate relation to the pace of development and the fact of underdevelopment itself is a constraint on export performance. How do we get out of this vicious circle? The answer lies in improving the quantum and quality of production of exportable items through hard work, imaginative planning and good salesmanship. India's performance has not been bad though it could be a lot better says,

DR. (MRS) KIRAN BARMAN

Export Strategy For Growth

DURING the process of economic development, every developing economy faces foreign exchange problem mainly due to (a) unfavourable conditions of external demand; (b) structural rigidities and imbalances in the various sectors of the economy; and (c) failure to pursue appropriate economic policies in some cases. To bridge up the foreign exchange gap two alternatives are open in the absence of foreign assistance. (i) reduction of imports through import substitution, and (ii) expansion of export earnings or export promotion However, the experience shows that the first alternative is not feasible in the early stages of economic development. To accelerate the rate of growth to put the economy out of 'poverty' and the 'Malthusian trap' such an economy needs increasing imports. Consequently, in such a situation the choice left before us is 'either to enjoy complete external equilibrium with a low growth rate or to diversify and to expand its exports in order to quicken its pace of gowth to achieve a new equilibrium'. Hence the need for strategic role of exports and especially that of manufactured and semimanufactured commodities is quite obvious in order to accelerate the pace of economic development

Increase in export earnings, consistent with the requirements of defence and development, has been the objective of India's foreign trade policy. However, since 1951 our foreign trade has been dominated by rising imports and relatively slow increase in exports On the eve of the First Five year Plan our exports were valued at Rs 601 crores which increased to Rs 2523 crores at the end of the Fourth Five year Plan. During the same period the imports increased from Rs 650 crores to Rs 2,955 crores (Table 1). It is, however, encouraging that our export earnings showed an increase of 31 per cent in 1974-75 and 18 4 per cent in 1975-76. However, due to a sharp increase in imports, of 65.3 per cent, the year 1974-75 ended with a trade deficit Rs. 1,180 crores which was the financed mainly by drawings from IMF under the 'Oil Facility' and external aid In 1975-76 the trade deficit is estimated to be around at Rs. 1,155 crores This gap with uncertain aid prospects and the keen desire for self reliance, makes it imperative that exports should be increased rapidly.

Dr (Mrs.) Barman is Lecturer in Economics, Banaras Hindu University.

It is worth bearing in mind the unfortunate fact that India's share in the total world exports declined from 2.2 per cent in 1950 to 1.19 per cent in 1960. It further declined to 0 72 per cent in 1970 and to 0.53 per cent in 1975 (Table 2) This is an unhealthy trend for our economy and the process must be halted

There are various external and internal difficulties which have stood in the way of expansion of our exports. On the external front, the factors which affect the foreign demand of a country's exports, are (i) income of the foreigners which affect their demand for Indian goods; (ii) prices of exported goods, and (iii) prices of related commodities in the world markets An exporting country can exercise control over prices of its export goods in proportion to its hold on the world market. To study the impact of prices on export performance through external demand, the export market can be divided into three parts, (i) commodities in which India is a major partner with other countries, i.e. oligopolistic market; (ii) commodities over which India exercises virtual control of supply, i.e. monopoly market; and (iii) commodities in which India is a marginal exporter, i.e. imperfect market

Oligopolistic Markets

Commodities like tea, cotton textiles, Virginia tobacco, manganese ore, black pepper and castor oil together account on an average for about 40 per cent of India's total exports and market for such commodities is more or less oligopolistic in nature. It is evident that with limited partners of equal strength in practical business it may be difficult for any single oligopolist to improve greatly upon his existing relative share of the total market by reducing the price of his product. Chances of new entrants in such markets are not remote. If the world trade is growing the oligopolist can have the benefit of marginal expansion. Thus India's share in world trade of such commodities is more or less constant and it cannot grow; it is to be accounted for by factors originating outside the economy. The sluggishness in demand is the basic limiting factor, although the possibility of inefficiency on the part of the oligopolists cannot be denied.

Jute manufactures, natural mica and lac are the commodities in which India enjoyed more or less a complete monopoly earlier No doubt some substitutes have been developed but their share in world markets is still small Hence Indian policies, more than any thing else would be responsible if there is stagnation in exports

In commodities in which India is a marginal producer such as coffee, raw cotton, raw wool, hides and skins, groundnut etc internal demand has increased rapidly and this has obstructed rapid increase in their exports.

Besides, the changing pattern of world trade is such that instead of promoting industrial development and raising the standard of living

in developing countries, the trade among the developed countries has widened and this has increased inequalities between the developed and the developing countries Further, protective barriers imposed by the developed countries have adversely affected the export trade of developing countries. Recession in developed countries has been another limiting factor in this regard.

Internal Factors that Affect Export Prices

On the internal front factors like export control, export duties, increased domestic absorption of exportable items for internal consumption, changes in resource allocation, rising cost of production leading to lesser competitiveness of goods in the export markets, necessity for import controls, emergence of new foreign competitors in the form of producers and suppliers of synthetic substitutes etc. act and react to influence supplies and prices of our exports.

A country like India where the need for rapid development is ever increasing, a serious problem arises due to expansion in domestic demand for exportable commodities, on account of rising incomes of the people. This increase in incomes exerts a downward pressure not only on exportable consumer goods but also on raw materials which are increasingly utilised by domestic industries to meet internal demand "There will also be a 'rebound effect' of the diversion to the domestic market of the demand that in the absence of import control, would have led to an increase in the consumption of imported goods" In such a case the private exporters find the domestic market attractive is in fact very attractive if one takes into account the exchange control, export quota and other regulatory measures which are associated with exports Rising incomes in such economies strengthen demand for consumer goods and present obstacles to exports For the private exporter the whole question is of relative profitability of the domestic market as compared to the external market.

To overcome these difficulties and to impart dynamism to our exports, the Government of India has recently taken a number of measures. These cover finance for export assistance and incentives, transport facilities, training in market research, rationalisation of institutional arrangements and technical services, release of foreign exchange for specified purposes, import replenishment, priority in allotment of source raw materials, etc. A number of steps have been taken from time to time by the Government and the Reserve Bank to provide credit facilty to exporters at a reasonable rate of interest. Commercial Banks also provide credit to exporters on a priority basis and the exporters can obtain both pre-shipment and post-shipment advances from these banks at concessional rates of interest For export promotion the Government of India has also set up several specialised organisations such as Board of Trade, Trade Development Authority, Export Promotion Councils, Commodity Boards, Indian Institute of Foreign Trade, Export Inspection Council etc India has also entered into a number of trade agreements with a number of countries to expand her commercial relations. From time to time, trade and economic delegations are also exchanged with other countries with a view to increasing and diversifying the flow of trade both in pattern and direction

Export Planning

As a result our exports have increased from Rs. 1971 crores in 1972-73 to Rs 2,523 crores in 1973-74, Rs. 3,331 crores in 1974-75 and to Rs 3,863 crores in 1975-76 Thus our exports have nearly doubled during the past four years However, this is no reason whatever

Source · International Financial Statistics IMF (Various issues).

for complacency in our export performance and we are still not out of the woods and much remains to be done to make our economy self reliant in foreign trade. For this purpose, export planning should be done sufficiently in advance.

In this connection trade and development policies should also be integrated in such a way so as to reinforce each other's strength for the economic reconstruction

Under the present circumstances our export planning should be done on a year to year basis and these yearly targets have to be dovetailed with long term projections A minimum period of 5 years will be required to gear production pattern to our export needs Therefore, comprehensive export and production planning over the next five years becomes extremely important

Export planning needs to be done in terms of products that can be sold abroad and markets which can absorb these products Obviously, growth of our exports will depend partly on increase in world demand and partly on our ability to secure a large share of the overseas market

In spite of the considerable diversification that has taken place in the past five years, there is still substantial concentration of the export trade both productwise as well as market wise The ten major products, namely, jute manufactures, tea, lac, natural mica, manganese ore, unmanufactured tobacco, leather, vegetable oils, fresh fruits and nuts, etc. together account for about 60 per cent of our exports Similarly, the first five major importing countries (UK, USA, USSR, Japan and Wes tGermany) together absorb nearly 55 per cent of our exports However, it is interesting to note that India's exports to these countries form a very small percentage of their total imports· in the USA it was 0 6 per cent, in the UK 0 92 per cent and in Japan 1 1 per cent

Hence, the immediate need before the country is to ensure that within the next five years not only the trade gap is narrowed down but eliminated as far as possible Indeed we have to think in terms of a surplus. It is gratifying that there has been a trade surplus of Rs 754 million in the first seven months (April to October of 1976-77, as compared with a deficit of Rs 9,162 million during the corresponding period of 1975 The country's foreign exchange reserves stood at Rs 22,460 million on December 17, 1976. This is the highest level reached in the last 20 years The study made by the Federation of Indian Chambers of Commerce and Industry, has estimated that our exports in 1980-81 could be of the order of Rs 5,811 - 6,265 crores at 1974-75 prices. This will mean that against the minimum estimated import needs of Rs 5,559 crores in 1980-81, there will be a small surplus

Higher Production, Key to Increased Exports

In a country with a growing population export surplus can only be obtained with increased production of the items that keep pace with their demand-internal as well as external Unless production is increased, export surplus will become difficult. This emphasises the need to establish a close and reciprocal relationship between the external demand and a continuous expansion in the production of exportable items For example, is estimated by F I.C C I that in order to be able to increase the export of engineering goods by Rs 752 crores in 1980-81 over 1974-75, the improvement in domestic production will have to be of the order of Rs. 4,424 crores Similarly, for increase in the exports of jute manufctres by 35,000 tonnes, domestic output will need to be raised by 161,000 tonnes Similar indicative targets have been set down for tea, coffee, tobacoo (unmanufactured), sugar, coal and coke, iron ore and cement, cotton textiles, art silk fabrics etc (Table 3)

The level of investment for additional exports should be matched by additional savings Unless the country is in a position to make this extra saving effort it will not be possible to support our expanding export programme It has been found by the F.I.C.C.I that, on an average an export of Re 1 will require an investment of Re. 0 75 to generate the necessary production. On the basis of export growth in 1970-75, it can be estimated that Rs 160 crores of additional savings per year or0.38per cent of the GNP has been used for export purposes So if the export target is to be maintained, an additional Rs 600 crores will have to be earmarked, to sustain production for exports. This would mean that in the next 5 years about 0.81 per cent of GNP will have to be saved to finance investment in export production industries and we can be certain that this goal would be achieved if fiscal policies are

more actively geared to promote larger savings.

Our experience shows that export market is not steady Innovations, changes in tastes and fashions, political disturbances, international economic developments, currency variations, freight rates changes, crop failures strikes etc. expose the export market to great fluctuations Therefore in this changing situation it is necessary that our cost of production should be competitive and quality of our products should be of the international standard. This can be possible only when our major export industries such as jute, cotton textiles, sugar, footwear, castings etc are rationalised

In the world market we have to compete on equal terms with highly industrialised countries These large sized units have a much lower cost of production as compared to our units and in certain cases their quality is also superior India can increase its exports of manufactured products in a big way if in the few selected industries with vast export potential, optimum size units are established and liberal financial support and assistance is provided For such units debt equity ratio should be considerably liberalised

The Problem of Selling

Indian machinery, especially textiles, sugar, cement and paper has established its name in South East Asia, West Asia and the African countries There is export potential for these and other Indian machinery if we give greater encouragement to joint ventures Till the end of March 1976 only 66 Indian industrial joint ventures went into production generating the export of about 32 crores. It is understood that many more joint ventures are under implementation which bring in foreign exchange to the tune of Rs 18 crores The joint ventures help not only in the export of machinery, but they also result in invisible exports of consultancy services, oil engineering works and generate income by way of management fees, dividends etc Joint ventures which have already gone into production have earned Rs 4 to 5 crores to the nation by way of dividends, know-how and other fees The joint ventures also help in the creation of demand of some of the inputs which are not available in the countries where these ventures are established. It is desirable that we should greatly encourage such ventures

A product does not sell easily and automatically in the world market even if it meets internationalpr ice and quality standards. Protective barriers imposed by foreign governments have special importance in this connection. According to a study conducted by the UNCTAD, the industrial tariffs, prior to Kennedy round in major developed countries were noticeably higher in some category or products, particularly textiles and clothing as comp red to other categories More generally the study points out, that there was a clear tendency for tariff rather to rise with the degree of labour intensity In spite of measures against such high tariffs adopted in the Kennedy round, reduction of such tariffs in labour intensive products was relatively smaller

Commercial Policies in Developing Countries

In recent year adequate attention has been paid to the various aspects of commercial policies in countries which have embarhed upon a programme of economic development Various devices of commercial policies such as tariffs, quotas, fixed exchange rates, trade promotion, marketing, negotiating techniques etc. are being used which have a decisive role to play Tariffs which were widely used to improve situation of unemployment in the thirties have since been used to check inflow of exports of manufactures and semi-manufactures to the great-disadvantage of the exports from the developing countries. In all the four UNCTAD and also in GATT, less developed countries have negotiated for tariff reduction on grounds of most favoured nations. However, in practice these countries have not been successful in their attempt.

Besides the rich Indian cultural background and with an extensive area covering a variety of natural vegetation and climate, India can use its valuable heritage to increase its foreign exchange earnings No doubt attention has been given in recent years but much more needs to be done This requires conscious and integrated planning not only at the national level but also at the regional level Its success also requires financial and other assistance from the developed countries Once it is successfully organised, it may render multiple benefits such as mutual goodwill and other non-tangible benefits in addition to bringing in much needed foreign exchange earnings □

EDUCATION AND EMPLOYMENT

K. K. RUDRA

and

S. P. RASTOGI

THE PROBLEM of educated unemployment has been engaging the attention of both educationists and policy planners in the Government for a long time and more particularly, since the beginning of the Fourth Plan.

Large scale unemployment among engineers, agricultural graduates and trained teachers in particular, attracted the attention of the Government to the issue of educated unemployment and various special programmes were adopted in the Fourth Five Year Plan like special employment programmes, programmes for educated unemployed and Half-a-million Jobs Programme designed in promote self-employment ventures as also the employability of the educated through stipendary training in addition to the employment generated by the functioning of usual plan programmes.

However, position did not improve at the end of the Fourth Five Year plan. The Draft Fifth Five Year Plan notes "The investment made in the Fourth Plan did not generate the same degree of development as was anticipated, both in the agricultural and industrial sectors' (Vol II Page 267) Agricultural production faced a slump owing to the drought and scarcity conditions several parts of the country There was also stagnation in industrial production The employment in the organised sector (covered by the Employment market information programme of the DGE & T) rose from 16 6 million in 1969 to 19 3 million in 1974 or only by about 15.2% which means an average rate of growth of 3 2 per annum. The inflationery conditions in the years 1973-74 and 1974-75 at home and abroad coupled with a tremendous rise in the oil prices since the year 1974 affected the place of economic growth in these two years (1973-74 and 1974-75) resulting in the deterioration in the job situation. The number of educated job seekers rose from 15 lakh in 1969 to 48 lakh in 1975 Among the educated job seekers the plight of engineering and agricultural graduates has received much attention from the planners. Quite so as huge resources have been invested in agricultural and engineering education and there is a large time lag in their supply But the position of job seekers in the category of graduates and post-graduates in Arts, Science and Commerce is not in any way better. These three categories form the bulk of graduate and post graduate job seekers 55,786 graduates and postgraduates were on the live register of employment exchanges on 32.12.61 whereas there were 755,889 graduates and post graduates on the live register at the end of year 1973. Out of them 6,52,026 about, 86 per Cent were graduates and post graduates in Arts, Science and Commerce In 1975 there were 8 lakh graduates and post-graduates in Arts, Science and Commerce on the live register

However, this data is not completely reliable as a true indicator of unemployment in the country. Its limitations are well known – multiple registration, presence of employed job seekers in the register, non-registration by a portion of unemployed persons and incomplete coverage with respect to rural areas, yet it is the only available time series data on the unemployment situation of the country which may indicate the trend in the unemployment situation over time When a cross sectional view is taken of the live register of the employment exchanges in various States in the country one can safely assume that the limitations do not affect the relative position of the States so far as unemployment is concerned However, as a precaution it is appropriate to apply correction factor particularly for the presence of employed job seekers on the live registers Since 1972 survey is on a large-sample and improved methodology, it is better to use its findings for correction of live register data. The problem of non-registration and that of incomplete coverage are not as significant in the case of educated job seekers as in the case of uneducated It is well known that the public sector is the major employer of educated persons in the country and recruitment in the public sector of educated persons is largely affected through the employment exchanges. Similarly the concentration of educated persons in the urban areas is a well known fact. The limited coverage of rural areas do not matter as much as in the case of educated job seekers

Enquiry into the causes

The problem of educated unemployment is a well known problem of maladjustment of supply and demand – supply of educated job seekers and demand for educated persons So any analysis of the problem will have to probe both the demand and the supply sides We have already noted the deficient demand conditions which apply equally to these categories as to others, if not more severely (because these categories have no special training in skills) Be that as it may, it is true that impact of deficient demand conditions is made often more severe by a rise in supply. The supply is primarily constituted by the out-turn from the colleges and universities

If we look at the supply side it will be evident that the facilities for general education has expanded greatly in our country through the plans The number of universities has risen from 27 to 96 and colleges from 695 to 3467 between 1950-51 and 1973-74 The number of collegeates arts science and commerce combined recorded a very sharp rise from 0 33 million to 3 million in this period raising the proportion of students in the age group 17-23 from barely 1 p c to 4 4 per cent. The out-turn of degree classes (general education) had similarly recorded a large rise from 39 thousand to 2.15 lakhs between 1950-51 and 1970-71.

In view of the simultaneous rise in the number of out-turn and the registered unemployed persons belonging to these categories we can arrive at a hypothesis that higher the educational out-turn, the higher is the incidence of unemployment in the State For the purpose of this paper only the total out-turn of graduates and post-graduates in arts, science and commerce have been taken for the reference period 1970-71. The out-turn data is available from the University Grants Commission This has then been related to the corrected data of job seekers on the live register brought out by the DGE&T. As some time lag (between 3 and 6 months in the

---

Shri Rudra and Shri Rastogi belong to the Planning Commission

minimum) is believed to exist generally between the students passing out of colleges and universities and their subsequent registration with the employment exchanges for jobs the 1970-71 State-wise has been utilised. (Table).

In 1970-71 U.P. leads (63634) in outturn while the last position goes to Haryana (690) West Bengal and Maharashtra. To have a better idea about the relative size of the outturn the latter has been converted further to out turn per lakh of population data as per 1971 census. This adjusted data shows now a slightly different picture While Haryana occupies the last position, the leader is now Delhi (335) followed by Punjab (possibly a large number of students belonging to Haryana study in the colleges and Universities in Delhi and Punjab because of contiguity of these States and U.P. to Haryana and also because of relatively smaller development of college level educational facilities in the area belonging to Haryana which earlier formed a part of Punjab) West Bengal now occupies the third position, U.P., the eighth So far as the registered unemployment as on 31-12-71 is concerned West Bengal tops the list followed by Bihar and U.P The last position is taken by J&K while Haryana is the last but one So the two ranks appear to be fairly close

Rank correlation

Finally in order to determine the degree of rank correlation between the outturn and registered unemployment of graduates in arts, science and commerce they are further rank co-related with help of formula $r=1-6 \Sigma d^2/n-(n/^2-1)$ where/'r' is the rank correlation coefficient, d is the difference in rank and n is the total number of states and Union Territories considered (i.e. 17).

The value of 'r' obtained with the help of this formula appears also to be highly significant (0.73) So a significant relationship between the outturn of graduates and registered unemployment among them may be suggested. The confidence in this co-relation is further strengthened by a very low margin of error (0 0348) which is far less 1/6th of 'r'.

The implications of the above study for policy purposes are obvious A policy of restricted expansion of the college education is to be followed While such a policy has already been there in the case of engineering (both degree and diploma) medical and agricultural education, no similar restriction has been imposed on general college and university education either at the State or at the national level so far Individual colleges might be imposing restrictions on admissions by demanding a certain level of marks obtained in the last examination (H S School final or Degree level, or the case may be) But there is no deliberate policy regarding the college-university enrolment in the context of planned development in the country There is a great public demand for college and university education which is believed to confer 'status' on the citizens in the society Limited job opportunities also have accelerated demand for higher education (particularly university education) as college education defers the entry into the job market and a university degree is also claimed as premium for eligibility for jobs. It is however admitted that it is more difficult to plan the admissions to general education than to technical education. The courses in general education, do not train a person for specific job requirement. There is no definite occupation-education linkage here. For example, for the post of an assistant in a government department any degree, be it in arts, science or commerce will do. So their market requirements cannot be estimated very easily, to which their supply can be fruitfully linked However, one thing is very clear we have to restrict the college and university education and attention is to be given more to qualitative rather than quantitative aspects of the college education. Craze for wage employment has also to be suitably curbed through vocational guidance Arrangements for training of school college leavers in self-employment in order to build up knowledge, preparedness and ability for self employment may be made regular and broad-based Moreover, as the Committee on Unemployment (1970) has noted, it is necessary to see that degrees are not used as filtering devices for jobs where a lower qualification will do

The recently adopted 10+2 +3 system of education with its emphasis on work experience and vocational courses is a step in the right direction though it may now be posing some teething problems of equipments, text books and training, added to the problems which are transitional in nature Attack on the supply side alone will not solve matters It has also to be supported by suitable promotional measures on the demand side for ensuring a faster pace of employment-oriented economic growth □

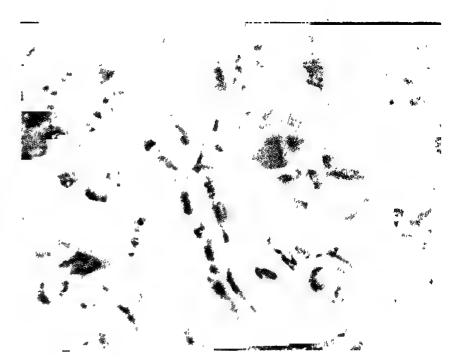
MARKETING OF CHILLIES FOR EXPORTS


A SIVA RAMA PRASAD

OF THE many spices that are exported from India, red chillies rank third in importance in respect of value On an average, about 18,000 tonnes of red chillies valued at Rs 53 million are exported from the country annually

Chillies are also produced in Japan, China, Burma, Kenya, Malaysia, Indonesia, Tanzania, Uganda, Pakistan and Singapore The exports of chillies from these countries, however, are relatively small as will be evident from Table 1

Indian Chillies have a high degree of pungency which the chillies in other countries generally lack Only the 'Hontaka' and 'Sontaka' varieties of Japan are somewhat comparable to the medium varieties of Indian chillies Indian chillies can be stored for a longer duration than chillies of other origins In India chillies are produced all the year round, while in other countries their production is seasonal India is, thus, in a position to export chillies which are of better quality to any country in any quantity and at any time However, because of their quality, Indian chillies are reported to cost more than the produce of other countries

Exports

When compared to the total production, the export of chillies from India is negligible – hardly three percent of the total production leaves the shores of the country. Table - 2 indicates the total production and exports to different countries to the world.

Ceylon is the most important buyer for Indian chillies as above 80 per cent of exports from India are taken by this country

Varieties

Though India produces a number of varieties of chillies, like Sannam, Rari, Mundu, Gospurea, Dandicut etc Only the Sannam variety of chillies is being exported in large quantity Ceylon imports mainly the Sannam variety which is mostly cultivated in the States of Andhra Pradesh and Tamilnadu Ceylon, perhaps on account of its close proximity to the Madras coast, has a special preference to the Sannam variety.

Quality Control of Chillies

The compulsory quality control and pre-shipment inspection scheme for chillies came into force with effect from 1st January, 1963. The chillies that are exported from the country are compulsorily graded according to the Chillies Gradin and Marketing Rules, 1962, prc mulgated, under the Agricultura Produce (Grading & Marketing Act. Agmark grades have bee specified under separate schedule for chillies of Sannam, Mundi Gospurea and Rari varieties. Fc chillies of other varieties one moi schedule has been prescribed. Be sides the varietal characteristics th grades of chillies are based on lengt admixure with other varieties, pe centage of loose seeds, broke chillies, colour and damaged an discoloured capsules etc. No cor signment of chillies having a moi ture content of more than 11.5 pe cent is allowed to be exporte Ceylon, which imports a sizeab quantity of chillies every year, h set up a co-operative wholesa Establishment through which a imports of chillies are channelise This Organisation invites glob tenders periodically for the supp of chillies. India is a major compet tor in these tenders and has an a vantage over the other competito in respect of the following.

TABLE 1

A Balance Sheet of World Trade in Chillies Peak Year 1971

Producers	Quantity in '000 tonnes	Consuming Countries		
		Ceylon	U.S.A.	Others
India	15.00	12.00	2.00	1.00
Japan	5.00	2.00	2 00	1.00
Mexico	3 00	—	3.00	—
TOTAL ·	23 00	14 00	7.00	2 00

Chillies : World Production and Trade

Particulars	1950	1960	1965	1970	1975
Indian Production ('000 tonnes)	351	419	383	450	500
Indian Exports (Tonnes)	3106	8364	9532	15000	18000
Indian Exports as percentage of production	0 9	2.0	2 5	3 3	3 6
Production in other Countries :					
Thailand ('000 tonnes)	—	47	74	60	65
Japan ('000 tonnes)	—	—	7	4	5
Mexico ('000 tonnes)	—	—	21	22	25
Burma ('000 tonnes)	—	—	17	18	20
Major Exporters :					
Japan (Tonnes)	813	3353	4092	4000	4000
China (Tonnes)	1270	1829	3150	2000	2000
Thailand (Tonnes)	6198	5029	1575	2500	2500
Mexico (Tonnes)	1219	1727	2743	2000	2000
Indonesia (Tonnes)	—	2083	508	1000	1000
Major Importers :					
Ceylon (Tonnes)	—	8819	14129	20000	20000
U.S.A. (Tonnes)	—	3571	4822	7000	9000

(a) It can supply at short notice graded and Agmarked chillies in any quantity It may be stated that no other country excepting Japan has introduced quality control in Chillies

(b) It can despatch chillies by country boats to Ceylon at minimum freight rates as the freight charges between Tuticorin and Colombo is the least The freight rate between Tuticorin and Colombo is Rs 1 06 per bag of 25 Kgs Whereas the freight rate between Japan and Ceylon is £ 16 55 for 40 cwt of chillies

Consequent Problems :

The following are some of the major problems affecting the quality of chillies meant for export Because of his eagerness to take the chillies to the market as early as possible, the producer usually harvests both ripe and unripe capsules together and dries the lot and takes it to the market without any sorting or grading The exporter usually purchases his requirements from the assembling markets, whenever he has an export order to execute As he is hard pressed for time to fulfil his commitment, he also offers the produce for Agmarking without any sorting on his part. The Inspectorate Staff at the time of Agmarking very carefully examine the produce and straightway reject it if it is not upto the Agmark standard

Once the lot is rejected, the shipper engages additional labour to sort and grade the produce according to Agmark grades This naturally increases his marketing costs. It is estimated that this re-grading of rejected lots costs the shipper about Rs 4 60 for each bag Lack of godown facilities especially with the Bombay merchants further enhances their difficulties. In their case the cost of re-grading a rejected lot is very high as the labour charges as well as rental charges for godowns are much higher in Bombay To obviate these difficulties the exporters should offer a little premium for chillies graded by the producer themselves and make them quality conscious. Similarly they should grade the produce on the basis of Agmark grades in the assembling markets before the sending the lots to ports for exports. A similar scheme of grading chillies at the assembling markets is already in vogue in Southern India. The commercial grading of chillies is already introduced in Sankaran Koil, Theni etc.

Similarly the producer-sellers do not bestow the necessary attention to dry the produce sufficiently before selling the same in assembling markets Such undried lots contain a high percentage of moisture and are rejected by Agmarking staff The excess moisture also leads to discolouration of the pods. Extreme care is also needed in handling chillies as they turn brittle on drying and the capsules break if handled roughly, letting out the seeds

Export Strategy — Recommendations

The present exports of chillies from the country are only 3 6 per cent of the total production (See Table 2) If Ceylon is excluded, India is not exporting even 1,000 tonnes to any other country Exports of 12,000 tonnes in 1975 show that our strategy is still based on Ceylon market and no other Dependance on only one market for the disposal of the crop is not always advantageous and efforts are needed to ex-

The necessity of careful handling of chillies need hardly be emphasised. This crude way of packing chillies results in breakage of the capsules and consequent loss to the grower.

plore new markets for Indian chillies. In this connection, the Indian Institute of Foreign Trade is conducting market survey studies in overseas markets to explore the possibilities of establishing new markets for Indian Chillies.

Next to Ceylon, the United States is the most attractive market for chillies. United States' importers, however, wish the Food and Drug Administration Regulations lay down stringent conditions for compliance before Indian chillies enter that market substantially. The Scoville Test for heat content is the single most important condition Indian chillies will need to pass for entry into this market. Besides, chillies have to keep up to the standards of requisite cleanliness and colour and should be without stems and caps and unblemished and free from mould Moreover, the Indian chillies, were found to be costlier in U S markets

India has been excluded from this attractive market largely by failure to guarantee unblemished quantity The Scoville Test for measuring the heat content of the chillies has only recently been formulated by the Food and Technological Institute, and it is felt that the Indian standards on moisture content are not stringent enough

There are opportunities for substantial exports to the United States, if Indian chillies of requisite specifications and gradings can be supplied It is essential that immediate adjustment in Indian Agmark standards should be carried out

Canada is yet another market which is still to be explored The Middle East is an area where India exports a little, but opportunities for more exist. There is also a limited market in a few other countries of Eastern and Western Europe Moreover, there is a specific market for chilli powder and chilli sauce in some other countries and possibility of exports from India are to be explored There is the danger of infestation of chilli-powder and this necessitates research and quality control to ensure an acceptable product

The Japanese chillies—'Hontaka' and 'Sontaka' - have a reputation in the United States and Canada These chillies are unblemished, have no stalks or caps, have the appropriate deep red colour and fully qualify by Scoville Test Every process in Japan from the sowing of seeds is carefully supervised and strict inspection of quality and cleanliness is carried out. Efforts should be made to follow these principles in India as well

The prices in India are subject to very wide fluctuations With a little over-production, the prices crash down and the acreage under the crop is reduced. In harvesting season it is necessary that the Government authorises either the State Trading Corporation or Food Corporation of India to buy the graded chillies in Regulated Markets at minimum fixed prices □

IGNORAMAN

wants to know whether those who defect suffer from incurable defects.

STUDENTS' FORUM

WATER is one of the basic elements to all life and covers more than 70 per cent of earth's surface However, of all the available fresh water, the mainland water is of great consequence to mankind.

But the essential aspect of water is its fluidity and varying distribution as regards time and space. It is this variability of the flowing water, from disastrous floods in some areas to equally catastrophic droughts in others, which is of grave concern to the planners and politicians alike

There have been scores of inter-state water and boundary disputes from time to time leading to waste of time, money and energy of the nation as a whole. Should we then declare :

Land and Water as National Property

Your entry in about 250 words should reach by 31st July 1977 on the following address :

BONUS AND WORKERS' RESPONSIBILITY

Bonus is not a grudging gift which the employers are compelled to give to appease the labour. It is a recognition of their contribution to the profitability of an enterprise. As labour and capital are equal partners in an industry, full gains of increased productivity should be equitably distributed between the two parties.

SUMITRA KULKARNI

LABOUR NOT only helps the production and economic growth of a country but also shapes the destiny of the nation in a real sense. The first focal points of our freedom struggle were the industrial and labour centres. Mahatma Gandhi was the first man to organise labour in 1917 and lead them through a successful strike in Ahmedabad. He recognised labour as an agent of change for economic and social revolution and quite early in the freedom movement he directed some of his very able workers to exclusively devote themselves to trade union activity as distinct from political struggle

Just as Gandhiji was the first man to organise a strike he was also the first man to demand bonus He successfully negotiated with the millowners of Ahmedabad and persuaded them to share their enormous profits with the textile workers On 28 October 1921, the fitst Bonus Award was given. On one side there was Mangal Girdhar, President of the Ahmedabad Millowners' Association, and on the other side the textile workers of Ahmedabad led by Gandhiji. The millowners resisted this novel idea of bonus But Gandhiji persisted and insisted that the demand for bonus was fair and just and the millowners should in their own interest share the profit with labour without whom they could not have amassed such wealth He explained that the entrepreneurship and capital investment by millowners could not by themselves produce wealth without the crucial input of labour. It was not easy to carry conviction with the capitalists, and then came a deadlock Ultimately Gandhiji suggested that Madan Mohan Malaviya should arbitrate between the two parties. In the beginning the millowners' Association and their President baulked at the idea According to them, how could a Brahmin know anything about textile business or appreciate the intricacies of the labour problem But finally they came round and Malaviyaji was accepted as the arbitrator. Gandhiji pleaded the case of labour so ably that the mill magnets were convinced of the correctness of his stand The bonus formula as it finally emerged was that wages for 13 months and 10 days were paid to the workers for 12 months work done This was a great victory for the workers and since then the workers of the country have got their rights to bonus duly recognised though every now and then disputes arise because of confusion of the bonus policy and lack of sincerity in implementing it

Mrs Kulkarni is a Member of Parliament.

What is Bonus?

Industry or for that matter, any venture is ultimately a cooperative effort between labour and capital Capital is only one input and labour the other, equally important and in some respects more significant input In fact, capital is a potential asset and it is labour that makes it dynamic by making it productive It is this living bond between capital and labour that was recognised by Gandhiji

The approach of the captains of industry should not be such as to exploit labour but to strengthen it and increasingly mobilize its potential for the common good The theory that profits should wholly go to the owners of industry is an outdated concept Labour's contribution to productivity is vital – in fact so vital that this casts a great responsibility on the workers to increase productivity and promote profitability It is only in this way that the entrepreneur, capitalist and the worker create wealth The industrialisation of a country will really advance when wage levels are not determined by the minimum price at which labour can be purchased but are at the optimal remuneration for productive level. This is the rationale behind the concept of need based wages which was the basic demand before independence and that is the ideal towards which the efforts of the Government should be directed. It is true we in this country have not yet attained this ideal but our goal has always been clear

A Novel Method

This is also the philosophy behind Bonus Bonus is, therefore, not a grudging gift which industry should feel compelled to give the workers to buy peace but it should be a recognition of the devoted partnership in the development of industry By the same token, bonus should be linked to productivity, and act as a spur to increased production The Government has taken a pragmatic view and laid down that no bonus will be payable unless the concern is making profit If this meets with the needs of the managers and owners of industry it also throws on them the responsibility to ensure profits and share them equitably with workers Unfortunately, however, there are many instances where accounting jugglery takes place and profits are converted into losses with a view to cheating the labour of its rightful share This is happening both in private sector as well as in public sector concerns. Profits are declared on the basis of a balance sheet and that is liable to be manipulated It is a common experience that balance sheet is mostly an excercise in figures where the experienced accountants jumble up the profit and loss accounts and assets and liabilities in such a fashion that few can disentangle it, including the professional accountants Then again, bonus is paid on allocable surplus and by the time all fancy planning is provided for no allocable

surplus is left for the share of labour.

In recent years, the Steel industry and its labour has tried a novel method for calculating bonus on an experimental basis in the Bhilai Steel Plant. For the last three years the profit made by the Company is being computed on the basis of the total production of the plant and the productivity records of each labour, which are being religiously maintained On the basis of this triangular computation Bonus is worked out and disbursed. So far the experiment seems to be succeeding In addition to this they are proposing to have plant performance schemes which can ultimately be applied to all the organised industries in the country

In fact, bonus should not only be linked with productivity but also ensure that the full gains of increased productivity do not go in a disproportionately large measure to the hands of the employers The gains should be equitably distributed between the two parties – labour and capital – in their partnership towards progress

Accountability is also Important

Another important point which should be borne in mind is that the Bonus is not only a question of accounting It is also a question of accountability. Just as the industry is aware of its accountability to its Board of Directors it should also be accountable to the society and to the workers. This alone will ensure the balanced progress and harmonious function of the industry.

At present excessive stress is being given on accounting which results in jugglery of figures and doctoring of balance sheets. If this concept of accountability is accepted and honestly implemented then only the real fruits of economic development will be available to the country as a whole and not merely to a coterie. One bane of our industry is the lack of method in evaluating results and productivity Even in spheres where tangible results can be gauged we do not pay sufficient importance to the concept of accurate measurements. In our entire management, there is no scientific or systematic evaluation of economic growth of productivity. It is not as if this measurement is not feasible or highly complicated It is only a question of evolving methods. Once this is done the industry and the labour will clearly know where things stand and what should be done to improve the production as well as profits and reap the benefits of the economy of scales. But this naturally presupposes a basic structure which without manipulating figures or account books gives a clear picture and submits itself to measurement and subsequent scrutiny. However most of our companies are satisfied into making profits and fight shy of measurements merely because they do not want to face workers' demand for recognition and reward based on measurement.

Thus, the bonus is a two way traffic. The labour has to ensure and increase productivity to merit it. Labour has to learn to distinguish between the industry and the management Industry, whether private or public is a property of the nation and it has to be respected as such Then only the industry as such can prosper – management is distinct from the industry and the labour may have differences with the management But very often or rather mostly the labour movement is confused on this issue and identifies industry with the management and non-cooperates with the industry in a manner that retards production, affecting the nations economy hurting the very cause of labour Therefore, the worker has to be an enlightened citizen of a modern democratic socialist country where he can ensure production and increase efficiency Similarly, the employers have to be conscious of their social responsibility and their accountability to the other partner, labour, and ensure fair and prompt computation of their share in the profits of the company □

(*contd. from Page* 4)

some others as a dream of an impractical man

Therefore, I should like to respect my faith in what I called total revolution and pledge myself to work for it as soon as my health permits

In our heritage from the past there are some things that are noble and valuable They have to be preserved and strengthened. But we have also inherited a great deal of superstition and wrong values and unjust human and social relations

Black Spot of the Society

The caste system among the Hindus is a glaring example of our evil inheritance From the time of Lord Buddha, and may be from even earlier times, attempts have been made to destroy the heirarchical system of caste but it still flourishes in every part of the country. It is time that we blotted out this black spot from the Hindu society and proclaimed and practised the equality and brotherhood of all men.

Similarly, there are rotten customs and manners associated with such things as marriage, birth, death, etc The purging of these evils also falls within the purview of the Total Revolution.

Coming to more modern spheres of life, such as education, it is time that the radical recommendations of the several Education Commissions, the Kothari Commission not being the least of them, are implemented

Here we might follow the example of China, in which all the schools and colleges have closed down and the students were sent out to the villages and slums of the towns to impart the rudiments of education to every citizen young or old.

I have not said anything here about the usual socio-economic reforms that are so much talked about but about which so little has actually been done. For this task too, youth power can be drafted with advantage to the youth themselves and to society at large

Finally, if God grants me better health in the coming months, I look forward to take up my cry of Total Revolution and do watever might lie in my power

In the meanwhile, the work need not be stopped Let everyone do his bit, singly or in cooperation with others

Here is a beacon light for our youth. I hope they will steer the course of their life towards that light

I am at their disposal even in my sick bed for advice and such guidance as might be capable of giving.

So, forward, my young friends. '*Sampoorna Kranti ab Naara hai. Bhawi Itihas hamara hai*'."

We are reproducing this provocative article on India's rural poverty from "Ceres, the FAO Review on Development", for September-October 1976. It presents a profile of poverty in India which State policies governing grain surpluses and their distribution have not succeeded in reducing. It pictures rural India with millions of people remaining outside the orbit of the public distribution system, with all the attendant problems of access to whatever surplus India's farms produce. In comparison, however, the more well-to-do and the urban middle classes have benefited. Bold types are ours.

Yojana will be happy to publish readers' informed comments on this article.

The Exploiters of Fate

T. J. BYRES

OF ALL the recent developments in India. perhaps the nodal one – the one in which the major contradictions of Indian society intersect and are expressed most starkly – a massive and increasing poverty. India throughout its recorded history, has been characterized by poverty and inequality. But contemporary poverty is of a special kind, marked as it is by a severing of traditional relationships and increasing political consciousness on the part of the poor.

In the underlying processes at work, the consumption patterns of the Indian poor, in both town and country, and within them the role of food, are of central significance In their turn, given these consumption patterns, the marketing arrangements in India are critically important and have indeed been one of the factors hastening the growth of poverty Marketing procedures, of course, cannot be divorced from the complex of influence that affect the level and structure of production and the latter merit attention Most important, in determining all of these realities, are the class configurations that exist in India, and which are expressed in and through the polity. Analysis that does not take class divisions into account may be worse than useless; it may be mystifying and positively misleading

India's current population is around 612 million and growing at about 22 per cent per annum compound, or by an annual absolute amount of 14 million or so Of the total population, approximately 80 per cent (or 490 million) live in rural India and 20 per cent (or 122 million) in urban India, a rural-urban structure that has changed relatively little in the last thirty years There has been some debate on the precise dimensions of poverty in India; at a conservative estimate, around 51 per cent of the total population, or 312 million people, live below the poverty line (defined in terms of a nutritionally adequate diet or a minimum desirable level of income) In rural India, probably about 50 per cent or 245 million (some estimates go far higher), live in deep poverty, most of them, in the words of one sober commentator, in "infernal destitution." In urban India, the figures are 55 per cent and 67 million respectively Certainly, the absolute magnitude of the poor has been increasing by substantial amounts and will continue to increase in both rural and urban India, and almost certainly the relative amounts are growing too The rural poor are composed of poor peasants (many of them sharecroppers and most of them forced to hire themselves out as casual labour to ensure a bare survival), landless labourers (some rendered landless recently), and rural artisans thrown out of employment by the spread of modern industry, and their number would be considerably larger but for the migration of many to towns and cities in the vain quest for employment The urban poor include the lumpen proletariat, without fixed employment and often pavement dwellers (who comprise what is euphemistically called the "informal sector" by underemployed develoment economists), and sections of the urban proletariat ((factory workers, for example) whose real earnings have stagnated since 1950.

A Growing Army of Poor

The rural poor devote, on average, something like 80 percent of their expenditure to food items, with the very poor devoting rather more (up to 83 per cent or so). In urban areas, while the very poor show a percentage of expenditure going to food almost identical to that of their rural counterparts (as Dandekar and Rath comment, at "the rock bottom of physical existence... there is little room for variation"), the overall average is less at about 75 per cent, partly because as one moves away from the very poor in the urban situation, the claim of rent upon resources is relatively high. The implications of the similarities and differences between rural and urban India in this respect (and indeed, of the significant regional variations that exist) are of considerable interest and in a large treatment would require careful analysis. But they need not detain us here The most striking aspect of the consumption patterns of the poor, both rural and urban, is for present purposes the extremely high proportion of their expenditure given to food

It is not only, however, that food looms ominously large in the consumption patterns of India's massive and growing army of poor (less a "reserve army of labour" than a "redundant army") The nature of what the Indian poor eat - if they can get it – is important. The overwhelming component is foodgrains and their substitutes. In the case of the rural poor on average more than 60 per cent of total consumer expenditure is taken by this category with the very poor relying particularly heavily upon it, and about 19 per cent by other items of food (such as edible oil, ghee and butter; sugar and jaggery, milk, meat and fish, which the poor buy in very small quantities and only intermittently). Among the urban poor, the very poor apply about 64 per cent of their expenditure to foodgrains and their substitutes and 18 per cent to other items of food (in this respect, again very like their rural equivalents). But as one moves away from them these proportions

change until among the higher layers of the urban poor they are respectively 36 per cent and 34 per cent. With the averages, however around 47 per cent and 29 per cent respectively for the urban poor as a whole, there is no gainsaying the considerable importance of foodgrains and their substitutes for the great mass of the Indian poor. In some parts of India, substitutes are important (in Kerala for example, tapioca is widely used), but it is foodgrains that constitute the critical element of the diet

Among foodgrains, one notes, there are two broad classes to be identified on the one hand superior or fine foodgrains, and on the other inferior or coarse The former are the cereals, wheat and rice, to which the poor have little access they are the fare, essentially, of the relatively well-off (with regional differences in which one predominates among those who can afford to buy them) The latter include the coarse cereals (maize and millets like durra, bajra and ragi) and also pulses (grams and lentils), and it is upon these that the poor depend heavily Pulses, in particular, are important as the major source of protein

The urban poor, obviously, have no opinion but to buy their food on the market. It is to be stressed, however, that this is true of the vast majority of the rural poor, too, both landless labourers and village artisans are more or less completely dependent on the market for their foodgrains (except in those relatively rare cases where either of these groups is paid in kind, and even where this is so they will still have to purchase a sizable proportion of what they eat), and a very large fraction of poor peasants are similarly dependent (where they themselves are forced to market food at harvest time, they have to buy food back later in the season often at far higher prices) This is an extremely important point that is often ignored in analyses of the intersectoral terms of trade The terms of trade in India have moved steadily in agriculture's favour ever since the mid or late 1950s, but this does not mean, as is often implied, that the whole rural population benefits The rural subaltern classes suffer from high food prices as much as the urban poor High food prices mean, for both the urban and the rural poor, that if, as has been the case, money income has been rising more slowly that food prices, the poor are squeezed in two ways: first, they are able to buy even less non-food items since their very physical survival is contingent upon obtaining food; and second, they may also have to reduce their consumption of purchased food and see their consumption of certain items shrink. What has happened in India to the supply and the prices of the food-grains the poor consume?

The Food Basket

The rate of growth of production of foodgrains as a whole has barely kept ahead of population growth since the mid-1950s, so that per caput net availability of foodgrains (i.e including imports) has risen hardly at all; this latter was 15.2 ounces per day in 1956 and 15.8 ounces per day in 1974. An examination of the different components of foodgrain output is very revealing Superior foodgrains i.e wheat and rice, have done perceptibly better on the whole than the coarse grains (with the exception, perhaps, of maize) especially in the last decade, and wheat has done very significantly better If the green revolution strategy has chalked up any successes in India, it is in relation to wheat. Thus it is that, with respect to the food basket, the interests of the relatively prosperous have been served. And they have been served, we know, in another important way, inasmuch as resources have been steered toward the richer regions, i e, for the most part those well endowed with irrigation and within those regions toward rich peasants and landlords, thus ensuring a widening of income inequality Coarse cereals, we observe, are predominantly rain-fed crops grown in drought prone areas – areas that the green revolution has bypassed: it is not that these crops are completely untouched by the new strategy, for some of them have registered growth in certain irrigated pockets of the country, but they have been neglected to a very considerable degree It is, of course, conceivable that the result of a buoyant output in the superior grains (and particularly wheat) might be a fall in prices, which would enable the poor to participate in whatever breakthrough may have taken place (One adds the caution that break-through is far too strong a word, since the great revolution has not yet come to rice on a wide front, while in wheat there is evidence of a tailing-off in growth after the initial bonanza years)

But, as we shall see in a moment, there has been no such price effect for reasons stemming from the basic class configurations in Indian society, in this instance from the dominance in the policy of those very rich peasants and landlords who received the highly subsidized inputs designed to usher in a green revolution. The poor have benefited not at all For the poor, indeed, the most portentous feature of the last twenty years has been the virtual stagnation in the production of pulses, which has brought about a fall in their net availability from 2.48 ounces per day in 1956 to 1.41 ounces per day in 1974, with alarming import for the supply of protein to the poor It is a tendency that has been quickened by the new strategy In those areas in which the new (subsidized) technology has made the production of wheat relatively very profitable, there has been a diversion of acreage from the production of pulses to wheat (there has been some diversion to one or two of the coarse cereals, too, but not on a scale sufficient to have any favourable implications for the poor).

Of Scant Comfort

Foodgrain prices were relatively stable in the 1950s, but have risen dramatically in the 1960s and 1970s The average for the decade 1950-60 (with 1950-51 – 100) was 99 9, for the decade 1960-70 (1960-61 100), it was 162 4; and for 1970-74 (1961-62 - 100) it was 241.5 All foodgrain prices have shared in the accelerating upward movement of the 1960s and 1970s, but disaggregation reveals that if we compare cereals and pulses since the mid-1950s, the increase in pulse prices has been especially rapid (see table)

Within the cereals category, the prices of co rse cereals like durra and bajra have lagged behind those of wheat and rice of late. But this has been of scant comfort to the poor The prospect before them is one of the prices of their staples rising steeply, which hits them very badly, while those of possible substitutes, traditionally beyond their reach, rise even more steeply, which puts them even further beyond their reach If we turn to the influences at work in the marketing of foodgrains, we discover institutional factors, rooted in the class structure, which give a powerful upward bias to foodgrain prices and which otherwise militate against the welfare of the poor.

There can be no doubt that, in conditions of society the machinations of private traders and rich peasants, able and willing to hold

TABLE

Annual growth of prices of cereals and pulses in India by plans (in percentages)

	Second Plan (1956-61)	Third Plan (1941-64)	Annual Plans (1966-69)	Fourth Plan (1969-74)	Whole period (1956-74)
Cereals	2.13	11 28	5 73	8.14	6.2 [illegible]
Pulses	4.22	17.16	—1.54	16.99	9.4

stocks with the aim of securing high prices, can add to any upward impetus prices may have. In India, these classes have had access to credit at low rates of interest from the banks, which helps them to do precisely this and to frustrate the Government's declared policy of controlling the grain trade in the interests of the poor (one of the many gaps between avowed policy and observed practice) The major casualities of such activities, let us stress, must be the poor; the margins within which they subsist are so narrow that they are severely hit by rising food prices

Sets a floor to prices

Do the poor derive any benefit from the Government's positive intervention in the grain trade — intervention whose original raison d'etre was, supposedly, to protect those who are most vulnerable to high food prices. Indeed, on balance this intervention is harmful to the poor. The government's stated aim has been to "socialize the grain surplus" (i.e. take the grain trade out of private hands completely), but it has come nowhere near this. Government procurement measures have never secured more than 7 or 8 per cent of total foodgrain production (or somewhere between 20 and 25 per cent of the marketed surplus of foodgrains). The organized pressure and power of the All-India Foodgrain Dealers' Association (apart from the clout of the very powerful rich peasants) have seen to that.

The wheat trade was nationalized in April 1973, but denationalized in the next year. Procurement, indeed, has been most successful in the case of superior grains, particularly so in wheat, less so in rice, but in neither instance achieving a commanding presence with respect to the marketed surplus. It is significant that procurement activities have been concentrated on the superior grains and have barely touched the coarse grains, despite the urgings of the Agricultural Prices Commission to the contrary. The poor, therefore, receive no advantage. Moreover, to the extent that the Government, by setting consistently and unnecessarily high procurement prices (far higher than those recommended by the Agricultural Prices Commission) as a result of organized pressure from rich peasants, sets a floor to prices and encourages their increase — the private trade taking its cue from each round of ever-increasing Government prices the poor suffer The foodgrains thus procured, along with those that are imported, are intended for distribution through a public distribution system of ration and fair price shops, instituted to serve the poor. About 75 per cent of these ration and fair price shops, in fact, are located in urban areas, to allay some of the discontent there Thus, the rural poor are manifestly untouched by them, except when famine threatens But what of the urban poor? Most of them receive precious little benefit from these shops either. The foodgrains that they sell, after all, are superior grains and the prices that they charge are beyond the means of most of the urban poor. It is the middle classes and, perhaps, a small section of the working class that are placated by them.

One may legitimately ask what the poor do in circumstances of progressive "immiserization"; when the absolute number of poor people is growing, there is an increasing proportion of poor in the population and a worsening of the degree of poverty among those who are already poor? Kusum Nair could write of one part of India in the late 1950s

"The Eastern districts of U.P. are known generally for their greater poverty. In Ballia I discovered that one meal a day is a common routine. In the neighbourhood district of Basti, Harijans who work as agricultural labourers are so poor that the practice of eating gobraha (grains – barley, jowar or paddy – collected from animal excreta, and cleaned) is common. This is not considered repugnant; it is accepted as something ordained by fate.'.(3)

To assuage the pangs

The facts of poverty suggest that such practices will not have disappeared. Whether they will continue to be regarded as "ordained by fate" is another matter. The realities of poverty in another part of rural India, West Bengal, in the 1970s are described thus:

"... While foodgrain prices have slumped by between 50 and 80 percent in the past 24 months, the per capita income, even in money terms, has remained more or less stagnant for the overwhelming majority. They, therefore, do what is only to be expected in the circumstances: as food prices soar, they keep cutting down their consumption of cereals. The quantity of grain intake goes down, and down. In many households, after a time, cereals quietly disappear from the diet, and substitutes such as roots and grass, if available are commissioned to assuage of the pangs of hunger.'(4)

Such are the implications of the low level and the uneven distribution of income in India, which dictate the consumption patterns of the poor, and of the existing class structure and class nature of the Indian state, which perpetuate and increase pauperization.

The Chinese, reputedly, have a curse which runs: "May you live in interesting times.'. India in the 1970s is a society undergoing interesting times. It remains to be seen whether the curse that inheres in the increasingly antagonistic contradictions which centre upon poverty and the poor will be divested ultimately upon the heads of the exploiting classes.

HANDLOOMS OF INDIA

A Heritage as Old as Yesterday and as Young as Tomorrow

A YOJANA SPOT REPORT BY

JASBIR BATRA

Photographs : P. K. KAPOOR

FROM TIMES immemorial Indian handwoven fabrics have been known for their beauty, fine texture and excellence of design. Even today they are widely acclaimed abroad for their riotous colours and artistry During 1976-77 handloom products worth Rs 215 crore were exported The anticipated export figure for this year is Rs 250 crore

Handloom weaving is the country's biggest cottage industry, providing livelihood to the largest number of people next only to agriculture One person in 60 is engaged in handloom industry and the rhythm of the handloom can be heard in almost every village A large number of handloom weavers are women concentrated primarily in the North-eastern region where weaving is practised as a domestic craft

Almost one-third of the country's cotton textiles and all silk fabrics are produced by the handloom weavers During 1976 the handloom sector which has an aggregate of 3.8 million looms, including 300,000 silk, art silk, woollen and other fancy cloth handlooms and 3 5 million cotton handlooms, produced 2,300 *million metres of cloth against* the Fifth Plan target of 3,000 million metres. Over one-third of country's cotton textile exports in 1976-77 came from this sector and over 60 per cent of the ready-made export garments were made from the handloom cloth.

Left : **A Digaru-Mishmi woman weaving a shawl on a Loin loom. Women weavers are mainly concentrated in the north-eastern States. Tribal women generally weave their own apparel.**

Right : **A Kalamkari fabric being painted by a handloom craftsman from Vijayawada. The Kalamkari fabric is both printed and hand painted. This technique consumes plenty of skilled labour, therefore the fabrics are expensive.**

Today more money is being spent by the State Governments annually on the development of handlooms than was spent in a whole Five Year Plan two decades ago. If we add to this the monies paid as rebate to the weavers the figure becomes even more impressive. The total outlay on handlooms in the Fifth Plan is Rs 300 crores.

However, inspite of the rich heritage and various measures taken by the Government to popularise the Indian handloom products, both at home and abroad, the Indian handloom industry has off and on been passing through difficult times, chiefly because of the exploitation of the weavers Scattered as they are in all parts of the country, primarily in villages, far away from all advanced technological research our weavers do not get the necessary feed-back of the market conditions With the result they are unable to orientate their production to the ever-changing tastes and preferences of their consumers

The National Handloom Fair, recently held at the Exhibition Grounds in New Delhi from April 9–24 was part of the aggressive handloom products marketing campaign launched this year, with an all time high export target of Rs 250 crore

According to Mr. Mani Narayanswamy, the first Development Commissioner of Handlooms, the main purpose of holding this fair was to boost up our exports and to bring to the notice of the consumers at home the range and variety of our handloom fabrics, and to arouse their interest in the skills that go behind the weaving and designing of these exquisite fabrics which are as good today as they were in thousand yesterdays. By inviting weavers from all over the country to gather under one roof it sought to promote a healthy exchange of ideas

First of its kind in the country, the Fair was organised by the Development Commissioner of Handlooms on behalf of the Ministry of Commerce and in collaboration with the Trade Fair Authority

On entering the Pragati Maidan what immediately caught one's attention was the impressive array of 35 kinds of semi automatic and improvised looms in operation in different parts of the country These were the looms on which "poems in fabrics" had been woven by our traditional weavers Weavers of world famous Indian fabrics like Banaras silk, Patola of Patan, Chanderi, Jamdani, Pochampalli, tie and dye fabrics from Andhra Pradesh, Rajasthan and Gujarat were manning these demonstration looms to give the visitors an idea of the dexterity, labour and imagination that goes into the creation of such exquisite fabrics

Almost all states had set up their pavilions at the exhibition and were engaged in selling products as well as the image of handloom products in a well planned manner Twenty per cent rebate was given on the retail sale of these products, besides a special rebate. Daily free film shows were held from 5 30 to 6 30 p m at Shakuntalam Theatre A 45-minute Fashion Parade "Heritage of Handloooms" was held daily between 7 45 p m to 8 30 p m Organised by Swank India, a leading advertising agency, the fashion show attracted large crowds Lovely models, both men and women, displayed a variety of costumes made of colourful hand-woven fabrics Each piece was a conversation piece in itself The multi-media technique used in projecting this show was something out of this world While viewing the attractive ensembles displayed by the models, the audience also got the feel of the hands that created these exotic fabrics in their rustic dwellings

A skilled weaver employed in the Weavers' Service Centre, Chowkaghat, Varanasi.

Banaras Silk

Seeing Kapoor with his camera and me with my notebook 50 year old Abdul Mannan beckoned us to come to his loom and watch him weaving Banaras silk Banaras sarees are the most intricate expression of handloom weaving in our country Abdul's family has

Chennille Weft Cutting Semi-automatic Loom invented by the research section of the Indian Institute of Handloom Technology, Varanasi. Priced at Rs. 1600, the loom can simultaneously weave and cut the chennile weft in single operation. Though this can considerably reduce the cost of Chennile druggets, manufactured at Aligarh, no orders have been received for the manufacturing of this loom. This loom was awarded an all-India prize of Rs. 1500 by the Invention Promotion Board in 1965.

years of tradition behind them in weaving Banaras silk.

No one taught Abdul how to weave. By watching and helping his father at work he got the hang of the job when he was still in his teens. Same is true of his ten children. Now with the experience of 35 years behind him, Abdul is a master craftsman who can produce most delicate and colourful patterns enriched by the natural delicacy of silk and gold threads.

At present he is employed with the Weavers' Service Centre, Banaras and gets a salary of Rs 800 per month

"What made you seek employment with the Service Centre, especially when you are doing the same work i.e. weaving Banaras silk, at the centre as what you were doing in your house and in your own good time? Do you not feel bound by all sorts of rules and regulations at the Centre, used as you are to the freedom of working at home helped by your family members"? I asked Abdul

"Candidly speaking I took this job to get out of the clutches of the merchants of 'Kunj Gali' in Banaras" said Abdul Kunj Gali is a street where all leading dealers in Banaras silk are concentrated and where according to Abdul all weavers get a raw deal "A regular monthly salary seemed like a God-sent to me. No longer would I be at the mercy of these traders who were making fat profits out of my skill, without giving me the full payment of my labour".

"Moreover at home I was nothing more than an ordinary weaver My skill at the loom was taken for granted both by my family members as well as my friends Weaving Banarasi sarees has been our family profession for the past many generations At my house all the members of my family, (he has nine daughters and one son) including small children participate in the weaving of a single saree

"However, at the Centre my weaving skill is appreciated both by my superiors as well as my instructor colleagues. Without spending a single paisa I can experiment with new designs, new colour combinations and adapt traditional designs to new tastes I can be pretty bold with my creations as I do not have to worry about the high cost of raw materials or about the marketing of the finished product. All these aspects are taken care of at the Centre Moreover, at the centre not only do I get a chance to show off my ability, but also to train others".

Abdul was rather vehement abou the part played by the rich and in fluential merchants in the coope rative societies They corner bene fits of all official assistance at th expense of the poor weavers c Banaras who are estimated t number around 50,000.

Above A craftsman cutting the block for printing handloom fabrics.

Below : Phanimoy Kastha, Jamdani weaver from Weavers' Service Centre, Calcutta. Jamdani fabrics are usually woven in white or off-white colours and involve weaving of intricate floral designs.

According to him it takes seven days to a month to weave a single Banarsi saree, price of which can range anything from Rs 150 to Rs 2,000. However, an average weaver gets only 15 to 25 per cent per saree.

Imagine his whole family, consisting of 4 to 5 members, is engaged in weaving this single saree, sometimes even working upto 14 hours a day and at the end of all that what he gets for his labour is a mere Rs 20 for more than a week's work. The saree merchants sitting in their shops and without moving a finger make huge profits, ranging from 25 to 35 per cent out of the weavers' helplessness. Being poor, the weavers cannot wait to find right customers for their products and agree to accept the price offered by the dealer "Yes, the Government has now started extending credit facilities to weavers for procurement of raw materials and marketing and cooperative societies are also there. However, too much redtapism is still involved. Moreover the needs of the weavers are too many and the money given as loans too little", he said.

Despite the above tirade, Abdul's family is not willing to work at any other job howsoever lucrative it may be.

M. Veerappan

Patola of Patan

The art of Patola weaving is an ancient one dating back to 7th Century A.D According to a legend around the 12th century A D. several families of Patola weavers from Deccan were invited by King Kumarapala of Gujarat to come down to Patan in North Gujarat Out of the 700 weavers who came over to Patan at that time only two salvi (weaver) families are now carrying on with the proud profession of their ancestors.

A unique gem from India's rich and ancient heritage of fine fabrics, Patola silk is known for its gorgeous colours, attractive designs and durability. This lovely silken fabric has no reverse side. Both the sides have equal intensity of colour and design because of the 'Bandhani process' of tie-dyeing.

Till yesterday it was a wedding saree in Gujarat and had a good market in Indonesia However, at present there is no steady demand for Patola As compared to other silks its price is considerably high, ranging from Rs 2500 to Rs 4500, and much beyond the common man's reach. Today the sarees have to be made to order.

To Kantilal Salvi, who sat before a primitive loom made of wood and bamboo strips moving a bamboo shuttle to and fro through warp threads, "Patola" weaving is nothing but accurate juxtaposing of warps and wefts of similar colour. The process is undoubtedly laborious and time-consuming but with practice one acquires a high degree of skill and dexterity

'Heritage of Handlooms', a fashion show was held at the Fair. Lovely models displayed a variety of costumes made out of colourful handloom fabrics.

Kantilal is the younger brother of Kerhavlal, the winner of the 1965 National Award for Master Craftsman. He is the only weaver at the Fair who is not employed with any Weavers' Service Centre. He was invited to attend the Fair by the Gujarat Industries Emporium. His sons, one of them had recently done his B. Com. and was assisting his father at the loom, had also learnt the art of Patola weaving and were keen to keep the family craft alive However, due to uncertain demand they had launched into other businesses too

According to Kantilal it takes two weavers working together for a month to weave one Patola saree, depending of course on the intricacy of its design and length The designs (bhat) are essentially traditional and flowers and human figures occur commonly in Patola patterns In order to avoid wastage of thread the loom is prepared for making three sarees at a time Though generally woven in saree length, the technique of Patola weaving has now been extended to scarves, borders, table cloths etc The raw material is pure silk thread from Mysore In olden times vegetable dyes were used. Their colouring was so fast that it was said "The design laid in Patola may be torn, but it shall never fade" Today chemical dyes have taken the place of vegetable dyes, bringing brightness and variety of shades to the Patola.

Phanimoy Kastha of the Weavers' Centre, Calcutta weaves Jamdani sarees with extraordinary skill His nimble fingers weave intricate floral designs on what looks like the simplest possible loom. Wall hangings, furnishing materials, shawls, lungies, durries and carpets were some of the other items being demonstrated by the weavers on the looms.

Also on display was handloom silk cloth printing based on the 16th Century Kalamkari (hand-painting) and wooden block technique. Some of the old Masulipatam (Andhra Pradesh) designs, the joyous 'Tree of Life' being printed right before your eyes were a joy to behold. The Weavers' Service Centre, Madras is also reviving the old

'Kalahasti' prints depicting stories from Mahabharata and Ramayana

Weavers' Service Centres

Numbering 15 at present these centres occupy a pivotal position in the development of the handloom industry in the country. They have done commendable work in designing, printing, promoting new weaving techniques, marketing a in adapting traditional motifs contemporary needs and fast chan ing fashions. Besides the abov they have also provided guidan and training to weavers and dyers the improved and scientific metho of production The Centres wo in close collaboration with the A India Handloom Fabrics Coop

Above . Vertical looms are generally used for weaving durries and pile carpets. The specialty of this loom is that no shuttle or sley is required for weaving. The weft threads are inserted into the warp by hand and beating of picks is done by Panja.

Below : A tribal weaver demonstrating his skill at the loom to interested visitors at the Fair.

rative Society and the Handicrafts and Handlooms Export Corporation.

Apart from publicising a dazzling collection of silk and cotton handloom sarees, dress and furnishing material, chiefly the work of the Weavers Service Centres, the most significant projection of the first All India Handloom Fair are the plans for launching "a new handloom era" in the country. These include modernisation of looms; training of weavers in improved techniques; development of cooperatives through Handloom Development Corporations; strengthening of primary and apex cooperative institutions, both for production and marketing; production of Janata sarees and dhoties for weaker sections; setting up pre-loom and post-loom processing facilities; substantial expansion of credit through the Reserve Bank of India and commercial banks; special assistance through National Cooperative Development Corporation for increasing spinning capacity, marketing and processing by cooperative institutions; programmes for increasing supplies, improving quality and better distribution of yarn, dyes and chemicals; diversifying production base and increasing use of multi-fibres, research and development through strengthening and expansion of the two Indian Institutes of Handloom Technology at Salem and Varanasi and the Weavers' Service Centres.

M. Veerappan

The new strategy also aims at augmenting the production base for exports; countrywide expansion of sales outlets and good publicity programmes, including fairs and exhibitions for promoting consumer preference for handloom products.

In a world where traditional crafts are dying, the Handloom Fair is the first step towards raising the image and potential of the handloom sector both in terms of earning and employment.

According to Dr N.P Seshadri, Joint Develoment Commissioner, Handlooms the fair was undoubtedly a great success Average attendance per day at the Fair was two lakhs and on holidays three lakhs Average sale per day was Rs 15,000 Even a State like Nagaland which had a very small pavilion sold a number of its products □

HANDLOOM INDUSTRY IN DELHI

Delhi is one of the important centres for handlooms in the country and the handloom weavers of Delhi are renowned for their craftsmen-ship. To assess the present status of the handloom industry in Delhi, the Delhi Small Industries Development Corporation (D.S.I.D.C.) carried out a survey of handloom industry in the Union Territory of Delhi in 1974.

According to the findings of the Survey there are 500 handloom units in the Union Territory of Delhi. However, the investigation team could identify only 451 units. Thus the coverage of the survey is 90.2 per cent of the total number of units. The main concentration of handloom units is in Kingway Camp, Tri Nagar, Shahadra and Subzi Mandi.

A General characteristic feature of the the handloom industry in Delhi is that artisans carry on their work throughout the year and deal in the manufacture of complete items.

The analysis of 451 sample units of handloom reveals that as many as 301 units (66%) are proprietory establishments, 101 units (22.4%) are working under cooperative societies, 37 units (7.11%) are of family ownership and only 12 units (2.51%) are working on partnership basis. The units covered in the survey have been divided into two categories i.e. (1) manufacture units and (2) manufacture-cum-dealer units. The former have been defined as being those units which are working on contract basis (job work) while the latter are the units which are selling their own products.

Employment

The 451 handloom units covered in survey provide gainful employment to 4193 weavers that is 196 by the manufacturer units and 3997 by the manufacturers-cum-dealer units. Out of these 2980 or 71 per cent are the hired labour and the rest i.e. 1213 or 29 per cent are the self-employed artisans. The hired workers in handloom industry in Delhi are mostly engaged on piece rate system. The rate of payment varies from 60 paise to 90 paise per metre depending upon the size and the quality of the cloth woven by them. For the female hired workers the labour charges vary according to the quality of the cotton yarn. Most of the hired labourers 1985 or 66.6 per cent are paid less than Rs. 10 per day, 900 or 30.2 per cent are getting from Rs. 10 to Rs. 14.99 per day. While the rest i.e. only 95 or 3.2 per cent of the artisans are paid from Rs. 15 to Rs. 19.99 daily.

In case of the self-employed artisans, 537 or 44.3 per cent are earning from Rs. 10 to Rs. 19.99 per day, 393 or 32.7 per cent of the self-employed artisans earn daily upto Rs. 9.99 while 166 or 13.6 per cent are earning above Rs. 30 per day.

A very wide range of handloom articles are produced in Delhi i.e. Bed covers, bedsheets, dressing materials, furnishings, dusters etc. The sample units of handloom industry in Delhi covered in survey produced articles worth Rs. 8.91 crore during 1974 (manufacturer units Rs. 37 lakhs and manufacturer cum-dealer units Rs. 8.5 crores). On an average the production per establishment came to Rs. 1,97,495.

The most important and basic raw material used in handloom industry is cotton yarn. The prices of cotton yarns fluctuate from time to time depending upon the demand and supply. The other raw materials being used in the industry are simple and fancy silk yarn, woollen waste, colours and chemicals.

The survey reveals that most of the establishments procure cotton yarn from the retail markets in Sadar Bazar and Fateh Puri. It has been reported that the cotton yarn in the wholesale market is available at exhorbitant rates which is beyond the reach of the poor artisans.

Most of the artisans of handloom industry in Delhi are using traditional designs. This is partly due to the fact that the artisans, being illiterate, do not have much appreciation for new designs and partly because they are not being offered facilities of training and orientation to use new and fresh designs from time to time.

Most of the units are found dependent upon their own sources of income. Out of 451 establishments covered in survey only 41 units could get loans from Banks and other financial institutions.

Marketing of fabrics is a vital problem of the Indian handloom industry. The study has revealed that 261 sample units retail themselves exclusively, whereas 269 units follow the channel of wholesalers and retailers in marketing the products, there are certain establishments who follow a combination of both the methods e.g. direct sales as well as sales through wholesale and retail dealers. The total turnover of the sample handloom units in Delhi is estimated at Rs. 9.66 crores per annum. □

Yojana Quiz

1. Why is yawning infectious?
2. Why can we put out a candle by blowing?
3. How does a bird know how to build its nest?
4. What is Prize Court?
5. What is mare's nest?
6. Does magnetism wear away?
7. What class of telegram is known as Human Life Telegram in India?
8. Sapphires of a very clear blue colour are obtained in:
   (*a*) Kashmir
   (*b*) Orissa
   (*c*) Karnataka

ANSWERS

1. It is a very well known fact that one human being can effect another by what is called suggestion. One person sees another afraid he becomes afraid. Suggestion is more powerful, the nearer the suggested thing is to the needs of life. That is why yawning is powerfully conveyed by suggestions—because it suggests the most urgent need of all life, which is to breathe.
2. By blowing the temperature of the candle is lowered to a point below which the stuff of the candle and the oxygen of the surrounding air are capable of combining with each other.
3. It is by the power of instinct.
4. A Court of Law set up in time of war to decide whether a ship and its cargo, captured by the navy is a lawful prize or is an enemy property or a cargo is contraband, they are sold and the proceeds thereof are distributed among all members of the navy at the end of the war.
5. When a person has made what he thinks is an interesting discovery, and it turns out to be nothing after all, we say, he has found a mare's nest. The allusion is to Mara, a kind of demon, who had a nest filled with wonderful treasures. Mara also gives his name to nightmare.
6. Every magnet, whether natural or artificial, tends, in time, to lose its magnetic power owing to a gradual rearrangement of the molecules composing it. However, a horseshoe magnet can be preserved by laying a bar of soft steel known as an armature, across its two poles.
7. This class of telegram receives priority in transmission over all express telegrams in case of accidents, serious illness or death of a person.
8. (a) Kashmir at an altitude of 14,000 ft.

Quotation Box

I believe both in the carrot and the rod.

—Morarji Desai

It is only because of the degradation of the environment that each ordinary decision of a judge shines out like a beacon of special virtue.

—N.A. Palkhivala

I believe we've given the fairest election Pakistan has ever seen.

—Z.A. Bhutto

Gandhian socialism is not an idle dream It is a practical, scientific programme of socio-economic development best suited to the needs of our people.

—B.M. Bhatia in the Statesman

Sovereignty is indivisible. We can't have two borders for any country.

—President Sadat of Egypt

He (President Carter) just joined politics, and I am senior to him.

—President Idi Amin of Uganda

We maintain the freedom to choose our paths, our forms of Government and also our patterns of development. We offer no precepts to each other, but we are united by our sense of inter-dependence and shared destiny, born out of similar history and legacy. We are convinced that we have common interests in peace, stability and a more just world order.

—Atal Behari Vajpayee

A New Perspective To Family Planning

K RADHAKRISHNA MURTY

RECENT DEVELOPMENTS in India have demonstrated that a lop-sided emphasis and a mis-guided enthusiasm to Family Planning may lead to disaster not only for the promoters themselves but also for the very strategy of Family Planning itself In the wake of the trauma of the emergency and the epic proportions of the electoral battle, a thorough review of the startegies and tactics of population control in general and Family Planning in particular is bound to take place and indeed ought to take place It is in this context that an *expose* of the interrelationship between the concepts of social development as a goal and population control as a means appears essential For, it would seem that the connection between the two concepts have somehow been missed by our policy analysts and makers

The concept of societal development is frequently taken in the restrictive sense of economic development Development is fundamentally a process of institutional change. As such, it is dependent on the reciprocal effects of a wide spectrum of economic and social variables Despite a satisfactory economic growth in the recent past, the social conditions in most of the developing countries including India had considerably deteriorated This is not appreciated by social analysis of the present day In its turn, this lack of appreciation is primarily due to the absence of widespread understanding of the need for a unified approach to development analysis and planning, and to an inappropriate assimilation of social factors of development in the total strategy of develoment planning. Development planning should directly involve attempts to promote economic and social changes by modifying existing institutional structures and policies or by initiating new ones. Unlike the developed countries, in the case of developing countries, development cannot be successfully launched without having fulfilled some preliminary conditions pertaining to changes in mentality, institutions, attitudes and social relations Development should be focussed on the well being of the broad masses of the people and economic growth has to be viewed and utilised as a means for achieving the desired social objectives and the planned social order. In bringing about that preferred style of development leading to a healthy social order, it is necessary to take into full account the peculiar situations and problems that plague the developing countries such as mass poverty, unemployment and rapid population growth Further there is also need to replace social structures and institutions that were traditionally anti-developmental with a view to creating new or better structures and institutions that would support and enhance the development effort All this would require integrity, imagination, boldness and dedication on the part of planners and political decisionmakers.

This is not to say that while emphasising social development, the importance of economic growth should be reduced to a secondary objective Economic activities have to grow along with social development The indicators for social develoment are. population, health, housing, nutrition. education, employment, and social security etc It is a recognised fact that the concentration of mass poverty was mainly in rural areas Even the poor in urban areas are better-off than the rural poor It is necessary to adopt certain specific measures including greater provision of economic in-puts in rural areas to establish physical and social infrastructures. The whole question of making employment opportunities conistent with the expectations of the youth, and at the same time. encouraging youth to adjust to the prevailing situation should be attended to It is also necessary to have a second look at the contents and quality of education to relate them more meaningfully to the requirements of development. It is not only a question of politial will to take necessary legislative, executive and administrative measures designed to successfully attack povery but also to the question of the most effective way of planning the attack itself. New concepts and models of planning are required to ensure socio-economic growth with social justice and progress.

Population and socio economic development are closely interrelated Demographic trends are affected by socio-economic development and, in turn, affect economic growth and social progress. It is generally recognised that the ultimate aim of any population policy should be to affect all aspects of development in order to bring about an improvement in the quality of life of every individual. Thus population policy should aim at reducing morbidity and mortality, reducing unemployment, raising the levels of living of all communities and generally ensuring socio-economic progress In many developing countries, India being no exception, population policies were evolved and identified solely with Family Planning or population control policies But population policy should be more comprehensive and address itself to problems posed by the high growth rate of population That means policies should be more "population-responsive" rather than "population-influencing"

In industrially developed countries, the birth and death rates have declined, almost simultaneously with sufficient economic and social development. The rise in the levels of living in the areas such as education, health, nutrition and housing have been the basic factors responsible for the dlecine in death and birth rates in the developed countries In India over the years a considerable decline in mortality is achieved in the absence of economic and social development owing to large scale diffusion and adoption of medical facilities But there is no commensurate decline in the birth rate and this is directly due to the overall underdevelopment of of the society. Although Family Planning programme was initially a success thanks to the temporary popularity of the contraceptive services, they did not in most cases succeed in either sustaining these

KARNATAKA

Some Aspects of Agricultural Labour

OF LATE, the economic condition of the agricultural labourers (AL) and the small and marginal farmers who form a major segment of the 'weaker' or 'poorer' section of our society has attracted considerable attention of policy-makers. This stems from a general belief that the benefits of development have accrued more to the rich than to the poor. The suggested approach that the overall growth of the economy through huge investments mainly in non-agricultural sector will enlarge employment opportunities and help to absorb a section of the agricultural workers, does not seem to hold much hope judging by past experience. Also, various socio-economic measures such as implementation of land reforms, bring in additional acreage under irrigation, provision of shelter to landless labour, fixation of minimum wages etc., have not proved very effective.

Magnitude of the Problem

As a prerequisite to policy decisions a proper and fuller understanding of the magnitude of the problem of the weaker sections is necessary. It also calls for frequent studies of their problems and conditions to maintain a level of social justice. In the following paper an attempt is made to examine the growth in AL, the various factors such as growth in crop acreages, irrigation etc which affect the employment of AL and the movement of wages of AL in the context of appraising the changes in their living standards.

Agricultural labourers formed a little over seven per cent of the State's population in 1961 and increased to 9.28 per cent in 1971. Separately for rural and urban areas their proportion increased from 9 03 per cent and 2.03 per cent in 1961 to 11 43 per cent and 2.57 per cent respectively in 1971. In absolute terms, in the course of a decade, the number of AL increased by 9.56 to 27 17 lakh in 1971. That is there was an increase of 54.26 per cent (71 63 per cent and 53 17 per cent separately for urban and rural areas respectively) in the number of persons who depend on wage employment in agriculture for their livelihood. Further, the increase in the number of male AL was quite considerable as compared to that of female AL. While male AL increased by 94 per cent female AL increased by 14 per cent.

In view of the non-comparability of the 1961 and 1971 figures, it is difficult to place full faith in the magnitude of increase revealed by the above figures. However, it appears safe to conclude at least as far as Karnataka is concerned, that during the course of the past decade there has been no decline in the proportion of population depending mainly on agricultural wage. Indications if any, are to the contrary.

Having observed that there has been no decline, but a possible increase in the number of AL it is interesting to look into the factors affecting the employment conditions of AL. The net cropped area in the State increased by 0 471 lakh acres from 252 75 lakh acres in 1960-61 to 253.22 lakh acres in 1970-71. Gross cropped area recorded an increase of 7.263 lakh acres from 261.63 lakh acre in 1960-61 to 268 89 lakh acres in 1970-71. That is, while net cropped area in the State showed an increase of 0.19 per cent, the gross cropped area increased by 2.78 per cent. This, however, is not specific to the years chosen as these two years are considered to be agriculturally normal years. On the side of irrigation, the gross irrigated area in the State increased by 38.77 per cent from 24.13 lakh acres in 1960-61 to 33 486 lakh acres in 1970-71. However, as a proportion of gross cropped area, gross irrigated area remained around 12 per cent for the State as a whole. Intensity cropping, measured as a percentage of gross cropped area to net cropped area, showed a nominal increase from 103.51 in 1960-61 to 106.19 in 1970-71. Extension of irrigation, however, does not seem to have had much impact on the intensity of land use.

From the foregoing it is evident that relative to the growth in AL, the increase in the extension of area under crops was not considerable. While AL increased at the rate of 4 4 per cent annually (6.3 per cent in the case of male AL), the gross cropped area increased at the rate of less than one per cent. That is, the demand for hired labour does not seem to have increased to any appreciable extent because of extension of cropped area and irrigation relative to the increase in the supply of labour.

The only other source of an increase in the demand for hired labour is from the adoption of improved methods of crop production, basically of a labour intensive nature. However, no information exists on the changes in the demand for hired labour as a result of improved methods of cultivation. It is only possible to indicate whether cultivation practices have improved and if they have, to surmise that demand for AL must have gone up. This can be done by using the index of agricultural productivity/production as a proxy for adoption of improved methods of crop production. The index of agricultural production (with the triennium ending 1961-62-100) rose to 125 3 in 1967-70. While food grains production increased by 45 8 per cent, non-food grains production showed an increase of 6 1 per cent. Similarly, while productivity index of all commodities rose by 39.3 per cent, that of food grains increased by 56 per cent, and non-food grains by 19 per cent. The increase in productivity and production of food grains appears to be largely due to the adoption of improved cultivation practices which are generally be-

Mr Satyapriya belongs to the Institute for Social and Economic Change, Bangalore

lieved to be of a labour intensive nature.

Besides employment, the other factor on which depends the economic condition of the AL is the wage rate at which they are employed. It may be mentioned that the wage rates for 'male field labour' increased at the rate of 5.4 per cent annually between 1960-61, and 1971-72. However, in a period of rising prices, an upward movement of wage rates (unemployment remaining the same) by itself does not imply improvement in the living conditions of labour. Though an appropriate method of to examine the changes in the living standards is to compare changes in the cost of living of wage earners with the changes in their total earnings (income), due to paucity of data, attention is devoted to an examination of the daily wage rates rather than total earnings as the trends in real wage rates would at least partly reflect the changes in the living standards. Using the consumer price-index for agricultural labourers, it was found that real wage rates of agricultural labourers in the state declined by about 10 per cent between 1960-61 and 1971-72. Thus it appears that though wage rates in money terms showed an increase they showed a decline in real terms. However, between 1966-67 (the year when the new technology in agriculture in the form of HYV crops was introduced on a large scale in the State) and 1971-72 there appeared a marginal increase in the real wage rates of agricultural labourers

It is possible, as mentioned earlier, that the adoption of new or improved technology in agriculture resulted in increased wage employment in agriculture resulting in increased total earnings. In the absence of data on unemployment and underemployment (which is more relevant as far as the agricultural sector is concerned) an attempt could, however, be made to arrive at the magnitude of the problem of unemployment and underemployment by using consumer expenditure data of the National Sample Survey. That is, the measure of under consumption is taken as a measure of prevailing underemployment It was estimated that an annual per capita expenditure of Rs 180 (in rural areas) was necessary in 1960-61 to have a desired minimum level of living. The total earnings of an agricultural labourer (taking 300 as the number of working days which is obviously on the higher side) was Rs. 203 in 1960-61 which was slightly above the desired minimum consumer expenditure. In these terms during 1960-61 nearly 34 per cent of the rural population (6.23 million) in Karnataka were below the minimum level of consumption and AL formed about 9.03 per cent (1.66 million) of the rural population. In 1970-71 the proportion of rural population lying below the desirable minimum consumer expenditure was nearly 63 per cent or 13.901 million. (It was 55 2 per cent in the case of the bottom 10 per cent of the cultivating households and 66 per cent in the case of the non-cultivating wage earners) The proportion of AL on the total rural population was 11 43 per cent (2 534 million) in 1970-71. Thus it appears that the quantum of employment also did not increase considerably as is reflected in the level of consumer expenditure.

Thus the picture of the agricultural labourers does not appear to be any brighter. Enactment of minimum wage legislation or even its enforcement is not likely to solve the problem of AL against a background of less demand for and more supp of such labour and of the absen of unionisation of AL. The increa in the number of persons dependi on agriculture for wage emplo ment does not appear to be an ou come of increased employment o portunities in agriculture but appea to be in voluntary shift into th occupation. There is therefore t problem of providing the means production including either lar or employment. Redistribution land by imposing a ceiling on th holding has been thought of as o of the remedial measures. While is quite appropriate to impose ceiling on larger ownerships as *redistributive measure its limite* unility in solving the problem is we known. What is needed is both rise in wages and volume of emplo ment This is possible only throug a well defined and properly impl mented plan for agricultural deve lopment and a positive programm for non-agricultural employment i rural areas □

PROCESSING OF MINOR SEEDS CAN SOLVE OIL SCARCITY

At least a million tonnes of oil can be produced for industrial purposes if oilseeds like nigerseed, mohwa, salseed, neem, karanj and palasa – available in abundance in India – is procured and processed on a commercial basis. This would to a very great extent mitigate the current shortage of edible oils in the country.

Large quantities of nigerseed and mohwa seed available in the forests of Andhra Pradesh go waste at present as only a small portion of this valuable oil resource is utilised by the Girijan Cooperative Corporation of Andhra Pradesh. A number of tribals make a living by gathering these seeds

While the country spends crores of rupees on vegetable oils import, barely 20 per cent of the minor oilseeds are collected and crushed. Processing of these minor oilseeds can easily give a boost to our rural industries generating further employment potential in the tribal areas

While the demand for oils and fats for edible and industrial purposes has doubled in the past few years, production of oilseeds has remainedastatic. As a result the country has been experiencing violent fluctuations in edible oil prices

Many agro-wastes like mango stones, brewery grains, coffee residues, spent silkworm pupae, seeds of tomato, melons, orange and grapes can be collected and processed for oil as the necessary technology is indigenously available.

Soyabean and sunflower – two new comers – yield good edible oils and have plenty of scope for expansion in their acreage. Other problems that need to be tackled are bad storage and inefficient drying which result in deterioration of quality and lower oil yield. According to experts, at least eight per cent of oilseeds perish due to bad storage

Andhra Pradesh, a major oilseeds producing state, has plans to cultivate oilseeds on a large scale in the command areas of Nagarjunasagar and Pochamped irrigation projects. At present oilseeds are cultivated only in rain fed regions An agency to centralise production, procurement and distribution as also to undertake research is essential. □

GUJARAT

RAMAN PATEL
Ahmedabad Correspondent

People's Courts
—An Experiment in Costless Justice

THE GUJARATI saying 'wealth, woman and land are the root causes of all disputes' has been proved more than correct in the Chhota Udaipur and in Gujarat. Wine was another factor of dispute amongst the tribals in this area A Gandhian worker Harivallabh Parikh, inspired by the teachings of Mahatma Gandhi, decided to camp in and serve among the rural areas particularly the poorest – the "Daridranarayans." He made it a mission of his life to bring peace and prosperity amongst the tribals

Today, after about three decades of self-less service, his word has almost become law and he is revered deeply by the tribals. This is amply evident to anyone who happens to witness the procedure of what is called "Lok Adalat" (People's Court). This court is, perhaps, very much different from what is generally understood by the term in the context of communism

Tribals, from villages far and near, and attired in their colourful but dirty and rags like costumes, throng on a prescribed day to the Rang Niketan Ashram, to attend the People's Court, which is held once a week All kinds of feuds and disputes, social, economic, financial and others are brought to the one man court. He hears both the sides, patiently, some times hearing runs into hours, but he hears them so that both the parties are satisfied.

The hearing over, the Judge, both openly and in private, uses all his power of pursuasion and past experience, to bring about an agreed settlement between the parties concerned. He takes a consensus of the assembly of tribals present on the occasion and delivers a judgement which is at once acceptable to all and particularly to the concerned parties. They leave the place satisfied with the verdict. What is more important is that they harbour no bitterness against each other.

The Judge, after the verdict is announced, gives a piece of jaggery, which is kept handy in a trough, and the warring parties, place it in the mouth of each other, signifying that

Much stress is laid recently on providing free legal aid to the weaker sections of the society, so that they are spared of heavy expenditure on legal consultations and lengthy court procedures. Often, the money for these is raised through loans at exhorbitant rates of interest from money-lenders and the like. During the last thirty years or so in Gujarat a Gandhian worker has, single handed, worked out an entire system of justice in his own way to relieve the public of this malady.

the relations between them will, in future, be as sweet as jaggery and that all bitterness will be forgotten for ever.

Take for example, an instance of how fair and practical is the system of delivering justice It was a case of dispute, between an Adivasi young man and his wife with a child The tribal young man had married another lady and therefore, the first wife had left his home and was not willing to go back again, even after a lot of pursuasion. The husband wanted her to stay with him, for the simple reason that he did not have the resources to pay for alimony etc to the first wife. The judge entrusted a few Panchas (Local leaders of the community) to fix the amount of penalty. This, they did, after consultation with the young man but even this amount was beyond the capacity of the man. So, the question of deciding the final figure of penalty was left to 'Bhai' as Shri Parikh is generally addressed He announced a figure which was accepted by all. With a loud slogan of "Mahatma Gandhi Ki Jai" the dispute was solved A brief judgement was written down and read out. Both the parties put their thumb impressions and the years-old dispute was solved at no cost to either party.

"What about the child"? I inquisitively enquired of the judge. 'Bhai' explained the local tradition. A divorced tribal mother would rear the child till he was able to eat, drink, and walk and then hand over to her former husband. It was the responsibility of the mother to inform the father of the child in case of sickness, but she will be absolved of any responsibility if he died This age-old social custom is in the interest of the women folk. 'Bhai' explained, the divorced wife would remarry soon The child of the former husband would have no rights on the land or the property of the second husband or the step-mother But the child would continue to enjoy his right to property if handed over to the father A grown up child would pose no problem for the father. "This reflects the robust, practical common sense of the tribals" remarked 'Bhai'

People's Court is synonymous with fair justice. Even police authorities direct the tribals first to go to People's Court and solve their problems and not to come to the Police and Courts for prolonged litigations A number of cases which were evading solution in law courts for months were solved in minutes in the 'People's Court. This is indicative of the measure of confidence, the authorities and the tribals have in the fairness of justice, delivered at the 'People's Court.

There is a social dimension also to this problem i.e, the winning over of the tribals from the habit of liquor. Practically, all the tribals in the area were addicted to drinks. Twenty five years of sustained social work, has succeeded in making the tribals realise that liquor is their first foe and that their lot will not improve so long as they do not give up liquor, generally manufactured locally. The majority of them have vowed not to touch liquor. Once again, the Gandhian way of pursuasion, and education accompanied by love and sharing their sufferings has proved to be the surest way to bring about social reforms.

How Nutritious Are Mangoes

DR. ZAKA IMAM

MANGO IS INTIMATELY connected with Indian folklore. In the early Sanskrit literature mango is referred to as *Amra*, and has held an important place in Hindu mythology and religious observances During the medieval period, we find a detailed account of its quality, varietal characteristics etc in Ain-e-Akbari, a treatise written in the reign of Akbar around 1590 A D The noted Persian saint and Sophi poet, Amir Khusroo wrote in its praise·

The choicest fruit of Hindustan
for gardens' pride the mango is sought
Ererip-e, other fruits to cut we ban,
But mango serves us, ripe or not.

Ghalib the noted poet sang eloquently in admiration of the mango Even otherwise, it is an important source of foreign exchange for it fetches a good price abroad

With the onset of mango season, which varies from April to August in different parts of our country, village women and urban housewives alike take active part in making pickles, ketchup, jams as well as a variety of other delicacies made of mango for use in lunch, dinner and breakfast

The number of varieties grown in India is fairly large, each variety possesses a characteristic taste, flavour, and consistency of pulp which determine its popularity and price in market. A desirable table variety is one which has a pleasant, sweet luscious, sub-acid, appetising taste and a good flavour In addition, small seed, firm and fibre-free pulp and good keeping qualities are also greatly desired. For culinary preparations like pickles and ketchups, mango of a sour variety is generally favoured. Some of the famous Indian varieties are *Alphonso* and *Pairi* (Bombay) *Fernandian* and *Mankurad* (Goa), *Langra, Lucknow Safeda, Dasheri, Fajri, Samar-e-Bahisht Chausa* (U P) and *Malda* (W.B) and *Himauddin, Alampur Benishan* (South India) Of these, *Alphonso, Dasheiri* and *Langra* are the most popular varieties

Generally some local varieties are more popular in different parts of India viz *Bombai, Zardalu, Langra, Gulab Khas, Gopal Bhop* in Bihar: *Mulgao*, Bangalore (known as *Totapuri* in Bombay market), *Neelam, Rumani* in South India, *Pairi, Kavaji Patel* in Bombay; Shendriva in Poona; Rajapuri (Gujarat) etc. Among the famous large size mangoes are *Hathi Jhool* of U.P and *Jehangir* of Madras both of which possess good table qualities.

Pulp consistency, taste and other characteristics of *Langra* and *Dasheiri*, leading varieties, are as follows: *Langra* : Colour of skin tends to remain green when it is ripe, pulp is creamy, juicy, plentiful and fibreless with a thin stone. *Dasheri* : Elongated and thin in shape, pulp is fibreless, juicy, sweet with a delicate and excellent flavour.

A fruit which is so greatly admired for its palatability, is generally little known to people for its dietary value as represented by sugar, protein, vitamins and mineral contents. Average values for proteins, carbohydrates, fat, minerals, vitamins (A, B2 and C), which are among the essential dietary requirements for a healthy body, are present both in unripe and ripe mangoes in its edible flesh part, as shown in the table :—

The sugar and acid contents vary very widely with variety and stage of maturity. The carbohydrates are principally sucrose, glucose, fructose and maltose *Dasheiri* is one of the richest in sucrose content while alphonso and Lucknow Safeda are among the most rich in fructose and glucose contents respectively. A high acidity is an undesirable quality in ripe mangoes for pickle purposes. As the fruit ripens, the acidity gradually decreases with a steep fall at the fully ripe stage The unripe mangoes of pickling variety contain citric, mallic, oxalic and succinic acids; the citric being the most abundant. Analysis of some 22 varieties from different parts of India has shown that the acid content (as mallic acid) in ripe fruit range from 0 18 – 0 56 per cent. Besides protein contents (average 0.6 per cent in pulp) which is very low in mango, certain free amino acids, such as aspartic acid, gultamic acid, alanine, glyoine, methioine, leucines and possibly eystine and gamma butyric acid are also found The amino acids are the constituent

	Unripe mango	Ripe mango
Moisture	90 00%	86.10
Protein	00 70%	00 60%
Fat	00.10%	00.10%
Carbohydrate	08.80%	11.80%
Calcium	00.04%	00.01%
Phosphate	00 87%	00 20%
Iron	4 5mg/100g	0 3mg/10g
Vitamin	150 i.u.*	48.00 i.u.
Vitamin B	0.03 mg/100mg	0.05 mg/100g
Vitamin C_2	3 mg/100 g	13 mg/100g

*i.u , for international unit, used to measure vitamins.

Dr. Imam is Assistant Editor, Science Reporter.

A blooming mango nursery (Photograph-ICAR).

parts or bunding blocks of proteins, which we generally get from vegetable or animal source.

Vitamins, A and C are rich in ripe mangoes, the vitamin contents vary with variety and stage of maturity Vitamin A content of some of the important mango varieties (in i.u/g) is as follows *Langra* (Varanasi) 32.2, *Langra* (Calcutta) 24.0, *Dasheiri* (Lucknow) 51 5, *Alphonse* (Bombay) 161.1 *Raspuri* (Mysore) 78.8, Badami (Mysore) 100.9, the highest value reported is 259.4 i.u./g in *Mankurad* (Goa). Other vitamins like thiamine (B1), riboflavine (B2) niacin and ascorbic acid vitamin (C) vary in their contents in different varieties; the range of some of these is high in some varieties. Langra contains an exceptionally high vitamin C content (176 mg/100g) which is highest in the skin and the flesh adhering to it.

Mango is otherwise a poor source of folic acid. Pigments such as carotenoid are also present, which increase in concentration during ripening. These pigments are converted into vitamin A in liver. Besides minerals shown to be present in mango in foregoing table, mango also contains magnesium, sulphur, copper, iodine and potassium. With so much under one skin, mango becomes nature's vitamin and mineral capsule It is therefore not surprising that the mango is considered to be so invigorating, refreshing, and fattening Being a rich source of Vitamins A and C, it is also useful in heat-stroke and apoplexy □

Exports and The New Import Policy

small scale sector, should have no difficulty in marketing their products abroad and export houses should develop a long term and abiding relationship with their supporting manufacturers. However, keeping in view the growth of exports the minimum export performance for recognition as export houses has been raised to Rs. 1 crore in respect of select export products and Rs. 5 crores in respect of non-select products.

Special dispensation has been made in the policy in order to enable the small scale units and units engaged in cottage and village industries to export their products. In the case of small scale manufacturers the minimum limit for export performance for the purpose of recognition as an Export House has been reduced to Rs. 25 lakhs for select products and Rs. 2 crores for non-select products. In case the small scale unit is unable to show exports even to this reduced extent, a further facility has been given that a number of small scale units can join together and set up a consortium of their own provided the total export performance of the principal units of the consortium is up to the required extent of Rs. 25 lakhs or Rs. 2 crores as the case may be. If a number of small scale units joining together cannot reach an export performance of Rs. 25 lakhs, they can still be given the status of an "export group" if the value of their exports is Rs. 10 lakhs with a condition that it will increase by Rs. 5 lakhs each year till it reaches Rs. 25 lakhs. Such export groups are given some of the facilities available to export houses. If the export group of this type has exported goods made in cottage and village industries sector, it will be treated as a full-fledged export house from the very beginning.

In formulating the new policy, the needs of other sections of general public and instructions have not been ignored. Provision for free imports has been made for anti-cancer and life-saving drugs, the requirements of blind people, requirements of medical practitioners, hospitals and medical institutions, drugs for preparation of Ayurvedic and Unani medicines and homoeopathic medicines. Similarly, books on science, technology and specialized subjects, of which Indian prints are not available are allowed to be imported freely. Import of certain materials and instruments required by artists is also allowed liberally. Facilities for imports by Research and Development institutions have been enlarged. All recognised Research and Development units are allowed to import without a licence, raw materials, components, instruments, equipment, etc. up to Rs. 5 lakhs per annum.

The new import policy maintains a delicate balance between the import requirements of the industry and the interest of the indigenous producers. While every effort is being made to promote exports by providing the necessary inputs at competitive prices and within the time frame required by the exporters, the interests of indigenous producers have also been kept in view. While we emphasise export promotion as a means for attaining self-reliance, we have also to enlarge the area of import substitution, for reaching the same goal. The new policy aims at reaching our objective of self-reliance with faster speed and greater faith. It is based on the philosophy of the "Trust in The Man..' □

No society can possibly be built on a denial of individual freedom

—Mahatma Gandhi

Books

The Future of the Rupee

India and International Monetary Management *by S K. Taneja; Sterling Publishers Pvt. Ltd. New Delhi*, 1976; *Pages*. *XIV*+490; *Rs*. 75

A PLETHORA of newspapers and economic journals notwithstanding, it may be stated that India's stake in the complex field of international monetary management has neither been clearly explained nor understood as to sensitize the public in adequate measure. Authoritative Government reports and scholarly studies very often err too much on the side of factual as well as theoretical presentations while those meant for popular consumption fudge the dough too much to lend any crispness to the final product The author has successfully steered clear through these extremes in this racily written book interspersed with cartoons reproduced from well known dailies and given the treatment an altogether novel form and content.

The focus on India's internal and external objectives in their larger international setting has been the main preoccupation of the author Hence, our position in the third world, aspects of international trade relations, foreign aid, debt, servicing problems and our foreign exchange situation take up the first six chapters. The more technical issues relating to the external value of the rupee link with sterling, problems of fixed vs flexible exchange rates, IMF quotas and SDRS are covered in the next five chapters These are followed by lucidly written pieces on the gold price debate, currency convertibility, international liquidity, issues of currency realignment, the second US dollar devaluation, floatation of the currencies and the stages of reforms in international monetary system. Four useful postscripts deal with the consequences of the oil crisis, a resume of the crisis (1951-1973), the work of the *Committee of Twenty* for monetary reform and the amended articles of the IMF released in April, 1976. The coverage of the book is, therefore, comprehensive

With the steady annual growth of our foreign trade at 10 per cent and the retention of the system of managed flexibility and exchange control, the author does not pitch his hopes beyond the reasonable limits of possibility, given our domestic capabilities to assess and adjust the relationship between the monetary system, trade and development. The book is well written, factually dependable and contains a wealth of material on all topical issues presented in nontechnical language. The book has also been well produced with a bibliography and index

—B. N. Nair

Economics at Undergraduate Level

Basic Economics *by I.C. Dhingra and V.K Garg; Price Rs* 12 50 *and MICRO ECONOMICS by K P M. Sundharam and E.N. Sundharam; Price Rs* 16 50, *both published by Sultan Chand & Sons, New Delhi.*

STUDENTS AT undergraduate level in Indian Universities as well as those who appear in various professional exams (where paper on Economics has been introduced) need simple approach to understand complex economic theory Most foreign books on the subject do not meet their requirement and as well, in some cases, are not quite suitable to students in this country The books under review are welcome as these try to teach the subject of Economics in simple and free from jargon language. With the help of simple examples and diagrams the students are gradually familiarised with the various aspects of economic theory.

The first book 'Basic Economics' is primarily intended for students appearing in the Economics paper of Chartered Accountants examinations It deals with theories of consumption, production and price determination, economic planning and development, and banking and foreign exchange. Naturally with so many fields being covered the treatment of each field could not be at comprehensive level and neither perhaps that was desirable because this is an introductory approach for students most of whom may have been reading the subject for the first time

The second book 'Micro Economics' provides a fairly detailed treatment of the subject and the authors have pain to spell out the various aspects of Micro Economics as comprehensively as possible The book is also within its course content of undergraduate level syllabi of Indian Universities The authors have also added appendices here and there which have enhanced the usefulness of the book The students would find this book of help in their studies

—V.S. Mahajan

Agricultural Credit

Rural Money Markets in India *by Subrata Ghatak; The Macmillan Co. India Ltd. Delhi; Pages* 230; *Price Rs* 58.

AGRICULTURE OCCUPIES a very important place in the economy of India providing about 50 per cent of its National Income. But unfortunately the Indian farmer in many parts of the country has not been provided with any facilities wether to irrigate his land or to finance the agricultural operations to market his produce. In respect of finance especially the position of the farmers is very much pitiable. The most dominating source of agricultural credit is money lender. Till 1951 money lenders were supplying, about 70 per cent of the total credit required by the agriculturists But, most of the money lenders take undue advantage of the ignorance of the farmers and exploit them to the maximum extent possible. On the basis of the All India Rural Credit Survey Committee report, the Government has taken some steps to increase the supply of finances by Institutional

agencies such as Co-operative Societies, Commercial banks etc. But still much is to be done to relieve the Indian farmer from the clutches of the money lenders. Recently, the Government has done something to reduce the burden of the farmers by imposing moratorium on rural debts and establishing rural banks.

So far no systematic study of the agricultural credit market in India has been undertaken except that some attention was paid to this in some official and semi official reports and Mr. Ghatak's work is the first attempt in this matter The book has been divided into 8 chapters. In the introductory chapter the author has presented a bird's eye view of his work. In the second chapter the nature and compositon of the dual rural money market has been described in detail. Supply aspect of rural credit is also discussed. Mr. Ghatak has also examined the various proposals for incorporating indigenous banks and suggested some methods for achieving this. In the next chapter attempts to promote linkages by a multiple credit agency approach have been made and the possibilities of a multiple credit approach were discussed and here the role of the Commercial Banks has been discussed in detail. In chapter 7 Mr. Ghatak made an attempt to analyse the role of agricultural credit in India's green revolution. The main observations and suggestions of the author were given in the last chapter.

Mr. Subrata Ghatak has thus made a scientific study of the problems of rural money markets in India. This book, though is an advanced level study will be of much use to students of agricultural Economics. Steps may also be taken on the lines suggested by Mr. Ghatak to provide easy and cheap credit to the farmers in order to enable them to carry on the agricultural operations without any difficulty and thus increase productivity and production in the agricultural sector

—A.T. Raju

Agrarian Reforms

Agricultural Development in China and India—A Comparative Study *by Kalyani Bandhopadhyaya, Wiley Eastern Limited New Delhi* 1976; *Pages* VI + 204

INDIA AND CHINA with similar agrarian structure, started their process of economic modernization simultaneously. Both countries have attempted to introduce sweeping institutional and techological changes in their agriculture Whereas China based her agrarian reforms on Marxist ideology, India followed a slow and tortuous way of development within the framework of a democratic political set up

In the course of six chapters, followed by a detailed index and bibliography, the author analyses the process of agrarian development of India and China during their post independence and post revolutionary periods Also the study compares their performance during the last 25 years in the context of the situation prevailing in the 1930 In comparing the changes in the agrarian set-up the author has not lost sight of relating them to agricultural production

The author contends that the main difference between the two countries in the field of institutional reorganization, is that while china succeeded in implementing whatever she intended to, in India most of the objectives failed to materialize This is because successful implementation of co-operative farming as attempted in India is contingent upon some degree of compulsion

On the other hand, the Chinese land reforms were based on force relationsip Regarding the agricultural input output of the two countries, the study concludes that the total foodgrains production of China during the 1950s and 1960s as in the 1930s remained much higher than that of India, but the rate of growth of foodgrains production in India during 1952-53 was slightly higher than in China

Much stress has been laid on chinese agrarian reforms mainly because, as the author admits, it is difficult to establish the afacts of Chinese agriculture. The study takes us through the different stages of Chinese reforms-From the Soviet model of development to collectivization leading ultimately to "Real Communism", The pros and cons of each stage has been discussed exhaustively Since the facts about Indian Agriculture are undisputed, its reforms are discussed lightly

To conclude, the book can be commended for its thoroughness and definitiveness and also for its clarity of ideas and expression

—R. Muralidhar

Family Planning

(*contd from Page* 29)

demands or creating new demands. This is basically due to the fact that the socio-economic systems in developing countries including India are not consistent with preferred behavioural patterns leading to low fertility We would be naive if we imagine that the reduction in the rate of population growth would itself raise the standard of living

The real obstacles in development are in the compound effect of such factors such as the inequality in agriculture, rigid social structure, imbalance in resources and allocations, and mal-distribution income Changes in fertility behaviour could only occur as an integral part of a general process of change. Unless Family Planning programme is linked and related to total Programme of development, including education of girls, status of women, marriage age, female emplcyment, social security at old age, etc, accompanied by wider distribution of the gains of development among the masses of population, the proposed decrease in the rate of fertility is not likely to be achieved. Obviously the need of the hour is not to go in for active campaign of Family Planning but to tackle the problem of social development along with the lines of economic growth. Unless the country achieves a breakthrough in overall socio-economic development, there is no hope of further reduction in the birth rate. The emphasis consequently should be on an integrated and package approach to economic progress and social transformation coupled with Family Planning Programme but not Family Planning Programme alone. The unified approach that is mentioned in the beginning is not only meant for developing new techniques of planning, but also for ushering in a successful evolution of the new course of development wherein political will for bringing about the required structural and institutional changes is of paramount importance.

Development Notes

Coal Output Up

Coal India Limited increased its production of raw coal in the outgoing year by 490,000 tonnes. The production in 1976-77 was 89.47 million tonnes as against 88.98 million tonnes in the previous year. Annual despatches in 1976-77 from the CIL mines were 83.77 million tonnes as against 81.72 million tonnes in 1975-76.

As a result of better productivity and better utilisation of plant and equipment, there has been a marked improvement in the CIL's performance and its subsidiaries during the year. There had been 10 to 15 per cent improvement in capacity utilisation of the various types of plant and machineries through better maintenance, spare provisioning and quicker repairs.

The indigenous content of mining equipment had been steadily improved by about 20 per cent and nearly 90 per cent of the equipment used by CIL was manufactured indigenously. For the first time Indian coal had entered countries like France and Belgium. Qualitywise Indian coal had been accepted by all the countries. Japan had evinced interest in Indian coal and had taken a trial cargo of 4,500 tonnes. Italy had entered into an agreement for purchase of 200,000 tonnes during 1977.

Schemes to Augment Milk and Poultry

The Union Government has sanctioned six centrally sponsored schemes costing Rs 210 lakhs to increase production of milk, meat and eggs in Andhra Pradesh. The schemes are in addition to the 13 sanctioned last year. A calf-rearing scheme would be taken up in Khammam district at a cost of Rs 60 lakhs which woud be shared between the Union and State governments in the ratio of 2:1. Under the scheme 5,000 small and marginal farmers, besides agricultural labour, would receive subsidy for rearing cross-bred calves.

Three projects for sheep-rearing would be taken up in Madak, Srikakulam and Nellore districts, involving an outlay of Rs 30 lakhs for each project. Two poultry development projects would be taken up in Karimnagar and East Godavari districts, each costing Rs 30 lakhs. The sheep-rearing and poultry development project would be fully sponsored by the Centre.

Electronic Estate For Women Entrepreneurs

An electronic feeder industrial cluster (WEFIC) for women entrepreneurs is being set up by the Tamil Nadu Government in its Dr Vikram Sarabhai Instronics Estate in Madras. 40 sheds are proposed to be set up under the scheme. Work on 10 sheds, at an estimated cost of Rs 7 lakhs has already started and the project was expected to be completed in about six months. The object of the scheme was to attract women entrepreneurs by providing them special infrastructural facilities to operate as a closely knot group. Sheds would be made available to women entrepreneurs at a concessional rate of ten paise per square foot per month at which sheds had been allotted to technocrats on the campus. Others on the campus paid twentyfive paise per square foot.

Land measuring 100 sq. acres had been acquired two kilometres from the campus at Adyar for expansion envisaged by the corporation. Under the project, developed plots in groups of quarter acre, half acre and three-fourth acre would be allotted to entrepreneurs. Besides, all necessary infrastructural facilities would be provided. The entrepreneurs would be required to put up their own sheds. At the Instronic Campus, which had an up-to-date test and development centre – a Rs 14.5 lakh building housing equipment worth about Rs 25 lakhs – wide range of items from TV components to sophisticated dolls of items were being produced.

Plan To Double Industrial Production in U. P.

The industrial production in UP will be of the order of Rs 3,000 crore by the end of the Fifth Plan. With the vast potential for sustaining rapid industrial growth rate in view, the State government has now set a target of doubling the industrial production to Rs. 6,000 crore by the end of the Sixth Plan. To achieve this target the State government envisage, an additional investment of Rs 1,500 crores both in private and public sector during the Sixth Plan. According to official estimate this additional investment will create fresh employment opportunities for about eight lakh persons.

The State government has proposed an outlay of Rs 350 crore for industry and mining in the Sixth Plan to keep the tempo of the industrial growth rate.

The outlay for industries in the Fourth Plan was only Rs 43 crore which was stepped up to Rs. 256 crore during the Fifth Plan.

Cashew Kernels Export

India earned foreign exchange worth Rs 99.70 crore through the export of cashew kernels and cashewnut shell liquid during the first ten months of the financial year 1976-77. Export of cashew kernels from April 1976 to January 1977 totalled 48,958 tonnes valued at Rs 98.85 crore against 47,717 tonnes valued at Rs 85.32 crore exported during the corresponding period in 1975-76. Compared to the previous year exports to the USSR, Japan, Canada, Australia, the Netherlands, West Germany, United Kingdon, German Democratic Republic and Kuwait were higher during the period but to the USA it was slightly less.

First Indigenous 4-Wheel Drive Tractor

The first indigenously produced four-wheel drive tractor has been introduced in the market. Designed and developed by Escorts Limited, the new 35 H.P. tractor is expected to save fuel, while raising usage levels.

It represents major breakthrough in Indian tractor technology, as in this country tractors are currently powered only in the rear two wheels.

Substantial economy in fuel consumption is likely to be effected through the usage of this tractor as slippage has been reduced from the normal 15 to only three per cent. Usage levels have also been increased owing to higher draw bar pull as a result of which it can pull three furrows instead of only two furrows like the two-wheel drive tractor.

Costing Rs 44,000 (ex-factory price) as against the two-wheel model which costs Rs 39,000 this tractor is likely to be best suited for paddy planting due to its low slippage factor. With an optimum usage level of 2,000 hours annually, the new tractor is capable of ploughing 150 acres and three crops a year. It is already in wide usage in several developed countries including France and Italy.

World Bank Aid For Fisheries

The World Bank and its affiliate, the International Development Association (IDA) have decided to provide $ 18 million for project designed to increase fisheries production in Gujarat. The IDA will extend $ 4 million and the World Bank $ 14 million on "Third Window" terms. Apart from supplementing local diets which are deficient in proteins, fishery development is also important for exports. India is presently the world's largest exporter of shrimps, which in 1974 earned $ 140 million worth of foreign exchange.

The $ 38 million Gujarat project comprises harbour improvement works and shore facilities serving the ports of Mangrol and Veraval; the development of infrastructure for eight fishing villages situated between Mangrol and Veraval and credit for investment in motorised fishing vessels and canoes.

At full development, the Gujarat project is expected to help increase fisheries production by about 44,600 tonnes a year (including 3,700 tonnes of shrimps) valued at $ 8.1 million.

Consumer Industries in Private Sector

All major industries, falling in the heavy industrial sector, from now onwards will generally be in the public sector. The consumer industries, however, will normally be in the indigenous private sector and will be further dispersed in the small-scale sector. The private sector too will get assistance for further industrialisation and import substitution. Enunciating the new government's industrial policy, the Union Minister for Industry said that the basis of industrial development would be decentralisation, use of indigenous raw materials and extensive utilisation of the available labour potential. This would eliminate unemployment.

The government would be discreet in nationalising industries, would oppose individualised and bureaucratic monopolies, and would make the public sector fully accountable to the people. The new government fully endorsed the policy of rapid industrialisation to make the country self-sufficient.

However, it favoured technology as well as a pattern of industrialisation based on efficient and full exploitation of raw materials, manpower and indigenous knowhow. The new government believes in the mass production of commodities and materials by the masses themselves.

Minerals Spin more Money

The total sale value of minerals in Rajasthan rose by 19.48 per cent in 1976-77 as compared to 1975-76. According to economic review for the state for 1976-77 the minerals production was on the whole more in 1976 compared to the preceding year. Among the metallic minerals the production of copper ore, iron ore, run of mine ore, lead concentrate and zinc concentrate increased. Only silver declined by 1.57 per cent during 1976. The review says that among the non-metallic minerals the production of calcite, china clay, dolomite, felspar, flourite, limestone, quartz, rock phosphate, silica sand, ermiculite, graphite and soap stone was more during 1976 compared to the preceding year.

During 1976-77 the total sale value was reported to be Rs. 4251.11 lakhs against Rs. 3556.99 lakhs in the previous year. Employment was provided on an average to 25,806 persons during the year under review as compared to 24,970 persons per day.

Improved Kerosene Stove

A revolutionary new kerosene stove has been put on the market recently which would save the nation 3,00,000 kilolitres of kerosene a year worth Rs. 30 crores.

The stove, marketed under the brand name "Nutan" has a thermal efficiency of more than 60 per cent making it much more efficient than even cooking gas stove.

Industrial Development Campaign in U.P.

An industrial development campaign has been launched in UP from April 18 by the State Bank of India in collaboration with the Directorate of Industries and Small Industries Service Institute, Government of India. During the campaign entrepreneurs will be encouraged to set up small industries. The State Bank will provide financial assistance on liberalized terms. sanction loans on the spot to viable projects identified by the entrepreneurs. The dentification and location of suitable enterprises will be done by the bank with the assistance of industries officers. The banks' techical cell will provide consultancy and technical services.

In the first phase the campaign has been launched in the potential growth areas of Sitapur, Shahjahanpur, Jhansi, Almora, Naini Tal, Etawah and Bara Banki where preliminary ground work of identification of entrepreneurs has already been completed. It is envisaged that apart from looking into the financial problems of existing units about 1,000 new units will be promoted in the backward areas.

Danish Loan For Fishery Development

An agreement for a new Danish loan of Rs 12.5 crores to India has been signed between the two countries in New Delhi. The new loan will be utilised for import of a large range of equipment and capital goods such as boats and other equipment for developing fisheries and fishery industry, machinery for fertilisers, petrochemicals, cement and rubber industries, machinery for food processing, drying, storage and machine tools for small-scale medium and large scale industries.

The loan is repayable in 35 years, inclusive of a grace period of 10 years, and is interest free. Denmark has been extending assistance to India since 1963. The total Danish financial assistance to India has so far been Rs 30.3 crores. With the present loan, the total financial assistance would amount to Rs. 42.7 crores.

Modern Bullock Cart

The Maharashtra cooperative engineering society at Kolhapur has produced a prototype of a three-tonne bullock cart designed to replace the traditional one-and-a-half-tonne vehicle.

The prototype is fitted with rubber tyres, ball bearing axle and a drum-type brake system entailing a reduction of 50 per cent, in the burden borne by the bullocks.

Its speed is about 25 per cent higher than that of the traditional cart. The steel body is fitted with an angle system and the galvanised hallow pipes prevent corrosion. It is priced at Rs. 3,000 and will be ideal for use in the rural areas.

Scheme to Raise Coconut Yield

A scheme to boost the yield of coconut palms in Lakshadweep islands is under way. The scheme has been jointly undertaken by the Agricultural Finance Corporation, Bombay, Syndicate Bank, Kavarath rath and the staff of the Union Territory of Laskhadweep.

The bank, after due recommendation from the AFC, will undertake for finance the small and marginal farmers of the ten islands of the territory. The scheme contemplates encouragement for inter-cultivation with crops which are directly or indirectly, beneficial from the point of view of increased productivity from individual holdings.

New Tomato Variety Evolved

The Gwalior Campus of Jabalpur Agriculture University has evolved a new luscious variety of tomato (Sugar percentage 1.62) named JTG 1. Among all the available varieties it has the highest Vitamin-C content. The plants of JTG 1 are semi-erect with an average height of 6.7 cm. The fruit is egg shaped and somewhat flattened. The crop duration is 100 to 175 days. JTG 1 accords the maximum marketable fruit, in view of its fleshy tendency and its firmness. No fruit cracking has been noticed in this variety. The whole of Madhya Pradesh has been considered for its cultivation.

Disease-Free Potato Seeds

The Regional Potato Research Station, Jullundur, has developed a disease-free potato variety. Seeds of the disease-free variety were successfully evolved in Research Stations in hill areas of over 2500 metres altitude. The system of potato cultivation can be now changed with enough disease-free seed being available.

A training programme is in force to educate farmers on the multiplication of disease-free varieties, which has helped to double per hectare yield.

Family Welfare Through Persuasion

Words acquire meaning through their usage. Innocen words turn "sinners" sometimes. Like propaganda, freezin; etc Professor Galbraith once ramarked that it was th irritating word "freeze" rather than the programme of "wag freeze" itself which provoked popular hostility against tha timely measure the British Government took in the midsixties The latest to join the rank of sinners is the term family planning thanks to the dis-reputable way the programme was promote in recent months. The re christeni of the programme as Famil welfare has, besides conveying the comprehensive nature of th programme as an overall plan of human development, help to overcome a serious semantic disadvantage in communication

The new dimensions and the positive thrust of th programme call for added efforts to persuade people to accep the small family norm, the pre-requisite of total welfare, as way of life. The prime Minister and the Union Health an Family Welfare Minister have repeatedly declared that th Government would go ahead with population control mos vigorously and promote all methods of birth control, of course without any element of compulsion and coercion. The polic Statement on Family welfare programme reiterates that th Government would spare no efforts to motivate the people t accept birth control voluntarily in their own interests and i the interests of their children as well as in the larger interests c the nation.

To motivate the people means to convince them that th suggested course of action is the best method to serve their ow interests In developing countries like ours, where the barrier of illiteracy, tradition, social norms and economic backwardnes etc are still formidable, the problem is to make laige sections of the population aware of their own interests. Thei vision of the quality of life is largely conditioned by thei environments- economic, social, political, religious and cultura Any motivational effort should take into consideration th various socio-economic differences in the environments c different sections of the people so that they are enabled t appreciate the advantages of a smaller family from a keene understanding of their own interests Similarly, any motivatic nal programme should be based on a clear understanding of th social, cultural, physiological, and psychological factors whic affect the use of contraceptives.

There have been hundreds of studies in our country o fertility, KAP, contraceptive use, population control organisatio and administration, education, and communication etc whic have collected enormous data on all aspects of the behaviour pattern of the people with regard to birth control. Little c these findings seem to have gone into the designing of motiva tional strategies in the past. This explains to some extent th wide gap between the awareness and practice of birth contr in both rural and urban areas

Now as the success of the programme depends entirely o democratic persuasion, it is time to give a more scientific loo to the problem of motivation and persuasion. The countr will touch the alarming one billion mark by the turn of th century if the trend is not checked. The Government aims a bringing down the birth rate to 30 and 25 per thousand by th end of the Fifth and Sixth Plans. This is possible only throug an all-out effort of the public machinery and the total an willing participation of the people We should see that we d not fall short of targets any longer. We should not forget that o earlier occasions population growth had belied the expe estimates. During 1951-61, the growth was as high as 20.5 pe cent as against the Planning Commission's estimate of 12.5 pe cent. The population had crossed even in 1971 the projectio for 1981 by about 20 million. All these point to the need fo relentless and more realistic efforts. □

A New Approach to

FAMILY WELFARE PROGRAMME

RAJ NARAIN

Minister of Health and Family Welfare

THE PRESIDENT in his address to Parliament on March 28, 1977, stated that "Family planning will be pursued vigorously as a wholly voluntary programme and as an integral part of a comprehensive policy covering education, health, maternity and child care, family welfare, women's rights and nutrition" The Prime Minister has on a number of occasions underlined the vital importance of family planning as a means to individual and national development and well-being This Government is totally committed to the Family Welfare Programme and will spare no efforts to motivate the people to accept it voluntarily in their own interest and in the interest of their children as well as in the larger interest of the nation.

Family planning has, however, to be lifted from its old and narrow concept and given its proper place in the overall philosophy of welfare It must embrace all aspects of family welfare, particularly those which are designed to protect and promote the health of mothers and children It must become a part of the total concept of positive health At the same time, it must find meaningful integration with other welfare programmes, viz, nutrition, food, clothing, shelter, availability of safe drinking water, education, employment and women's welfare It will be our endeavour to bring about this integration in a greater degree We expect the States to do the same.

The change in the name of the programme from family planning to family welfare is a reflection of the Government's anxiety to promote, through it, the total welfare of the family and the community. It is our intention to take the programme forward in the real sense as an investment in man. We wish to make it abundantly clear that in this task there is no room for compulsion, coercion or pressures of any sort. Compulsion in the area of family welfare must be ruled out for all times to come Our approach is educational and wholly voluntary There will, however, be no slackening of our efforts in this direction

The Government attaches the highest importance to the dignity of the citizens and to his right to determine the size of his family. We have no doubt that by and large the people of India are conscious of the importance of responsible parenthood, given the necessary information and adequate services, they will accept the small family norm We will promote all methods with equal emphasis and it will be left to every family to decide what method of contraception it will like to adopt Employees of the Union Government, State Governments, autonomous bodies, local bodies, etc, will be expected to set an example and to adopt the small family norm

We are totally against any legislation for compulsory sterilisation either at the Central level or by the States Sterilisation, both male and female, is a terminal method and suitable for those couples who have reached the optimum family size. Services for sterilisation will be offered free of cost to those who voluntarily wish to adopt this method. Similarly other services under the programme will be available to the people free of charge. The acceptance of sterilisation and IUD involves to and fro travel to a clinic, a brief stay in the hospital, resulting in possible loss of wages which the majority of our people cannot easily afford In view of this, it has been decided to retain the provision for monetary compensation. Any medical complication resulting from a sterilisation operation will be attended to free of cost; and if in an unfortunate case recanalisation becomes necessary, this facility will also be offered to the individual concerned under the best possible professional care without any charge.

Nearly 80 per cent of our population lives in villages Medical services are not able to reach them in an effective way. An integrated rural health scheme is on the anvil and will be implemented shortly It is of the utmost importance that adequate ante-natal and post-natal care is made available to pregnant mothers. To this end a comprehensive scheme of training of indigenous midwives (dais) will be implemented Under it maternity services will be made available to all mothers who may need them The programme of immunising children against common diseases such as Whooping cough, Diphtheria and Tetanus will be expanded further. We expect that the State Governments will give necessary co-operation and assistance in this direction

The direct correlation between illiteracy and fertility and between infant/mother mortality and the age at marriage is well established by demographic studies While on the one hand the Government will pursue its policy of according high priority to the improvement of women's educational level, both through formal and non-formal channels, it will also bring legislation for rising the minimum age of marriage for girls to 18 and for boys to 21.

Family planning and population control is a subject in the Concurrent List, yet the implementation of the family welfare programme is very much the responsibility of State Governments. Assistance for the implementation of the programme is provided by the Central Government to the States on cent-per-cent basis. In order to ensure a purposeful implementation of the family welfare programme, the principle of linking a percentage of Central assistance to the State plans with their performance in family welfare programme will be continued.

Population education has so far not received the attention it deserves.

The NCERT have developed some models for the introduction of population education in the school education system. These models have already been adopted by the Central Schools Organisation. We would urge that the departments of education in the States should adopt these models, or their modified versions, in the syllabus in the schools Forty two per cent of our population is below the age of 15 years It is this population which will soon be entering in the area of matrimony. We must take steps without any further delay to see that the youth receive population education as part of their normal courses of study.

The population of India has been increasing at the rate of about one million every month. It has increased by nearly 270 million since 1947 and is today estimated to be 615 million. If the present rate of growth continues, we will be touching the one-billion mark by the end of the century. This rate has to be arrested. The birth rate targets of 30 and 25 per thousand by the end of the Fifth and Sixth Plans respectively can be achieved only with the total and willing participation of the community in the family welfare programme For this purpose it is important that all media of publicity, including motivation through the extension approach, should be utilised fully by the Central and the State Governments We would very much expect that just as at the Centre we have involved all media units of the Ministry of Information & Broadcasting in the motivational campaigns, in the States also the State Departments of Public Relations and other departments having their own publicity set-ups would be totally associated with the motivational effort.

It is of equal importance that trade unions, chambers of commerce, cooperative societies, organisations of women, federations of teachers, village panchayats and all other institutions which can influence public opinion should be associated intimately with educational campaigns. The village panchayats can play a significant role in this task. Their potential as change-agents needs to receive greater recognition and attention.

No programme will succeed unless voluntary organisations particularly youth and women's organisations participate in its implementation fully and extensively. So far this participation has been very limited The Government wishes to invite the suggestions of voluntary organisations and such public bodies as are engaged in the general task of Family Welfare for evolving suitable patterns of cooperation and assistance Full rebate will be allowed in the income tax assessment for amounts given as donations for Family Welfare purposes to Government, local bodies, or any registered voluntary organisation approved for this purpose by the Union Ministery of Health.

While the existing methods of contraception will continue to be available to the people, it is important that the search for newer methods should be intenisfied The Government will give special attention to the necessary research inputs in the field of reproductive biology and contraception.

The programme and the approach for implementation of the Family Welfare Programme as outlined in the above paragraphs will succeed only if there is willing cooperation from all in full measure. The Family Welfare Programme embraces all the principal areas of human welfare. It will be wrong to leave it only to the Ministry of Health and Family Welfare in the Centre and their counterparts in the States It is essential that all Ministries and Departments of the Government of India as well as of the States give due importance to this programme and work for its furtherance The performance of Family Welfare in the States will be intensively and carefully monitored and the Union Cabinet will review the situation in depth at least once a year. Suitable machinery for ensuring coordination with other connected programmes of welfare may be set up in the States also. □

SUCCESS STORIES

THE FIFTH ASSAM N.C.C. Battalion, with Heaquarters at Tezpur recently completed its Silver Jubilee Celebration. Ten thousand people witnessed the ceremony. Apart from the military feats, unarmed combat etc displayed by the Cadets—both boys and girls was the story of social service rendered by the Cadets

In ten days' time the cadets constructed a 250' x 60' x 10' fishery tank. One hundred Cadets worked daily for 4 hours to transform a mosquito breeding ditch to a fishery tank. Besides improving environmental hygiene and creating a source of fresh protein, this has succeeded in creating a deep impression on the public aobut the constructive urges of the youth.

The Cadets of the Battalion also donated blood They have drawn up a long list of willing Cadets for blood donation and have requested the medical authorities both civil and military to come to them when in need

The Cadets during Annual Camp also provided voluntary labour to complete a school house at Bindukuri

FPO, Tezpur

LES ATELIERS AU FILS D'INDIA" is an institution employing destitute women engaged in the manufacture of wall linings and curtains solely for purposes of export. In order to inculcate the habit of saving among the working women, the State Bank of India's Pondicherry branch has opened Savings Bank Accounts numbering about 300 in the names of the working women

Every week a sum of Rs. 2/- to Rs. 5/- is collected from each worker and remitted by the institution to the Bank. Thus the poor and the destitute women who hitherto had no easy method of saving have been brought in to the Banking fold. These women have so far been able to save Rs 32,000/-

SHRI SAMUDRAM, an agriculturist, was convicted and sentenced to life imprisonment on a charge of murder of his wife. He has been repenting all along for the grave mistake committed in a fit of temper

Shri Samudram was sentenced to life imprisonment on the 27th January 1976 Impressed by his good behaviour, the authorities have allowed remission of sentence and released him from jail recently He is 43

When he came out from prison he was penniless and was not able to get any financial support from villagers Thanjavur Branch of the State Bank of India came to his rescue and provided him financial help to start a small shop

—**R. Ramanikanthan**
FPO, Thanjavur

The Problem of Rising Prices in India

V. J. AREKAR

IN ANY DEVELOPING economy price control has to be an integrated policy of general economic development and a country which fails to pay adequate attention to this aspect is boundto suffer from the evils of rising price levels. This is true in the case of our country. Ever rising price-level upsets development programmes of the country. That's why we had to recast our five year plans, from time to time taking into account the then price-levels in the economy. In modern economy, all the sectors are inter-dependent; if somewhere something goes wrong it creates adverse effect on the entire economy. It will disrupt the rational allocation of scarce resources to the different sectors. Budgets of these sectors will stand completely upset. Inflation will be generated in the economy. Once it is set in motion, it will take its full course delivering all its evil effects It is too late then to control. It is like the vicious circle without any break through. Rise in prices leads to rise in cost of production and rise in cost of production leads to rise in price levels. If this happens, the authorities feel frustrated and then they say that rising price level is an essential feature of any developing country.

True. But the rate at which it rises is a matter of concern, and certainly not the rate at which it is galloping in India. In this context I wish to quote Mr Ford, American Ex-President. When he assumed his office, the general price level in America was rising at the rate of a little over three per cent per annum So Mr. Ford in his presidential speech made a reference to it and said, "our number one enemy is rising prices (inflation), we must fight it out first". But in our country when the price level has been rising at the rate of 25 to 28 per cent per annum, little has been done to arrest the upward trend

Price-level concerns all, more so the fixed income groups They are hard hit by rising price level The rupee which they earn with hard labour deteriorates in value, fetching less and less each day They look towards their government helplessly to do something to control the price level or else to increase their dearness allowance and in pursuance of this resort to morchas, gheraos, strikes, go-slow tactics and violence which proves very costly to the country Millions and millions of manhours are lost bringing down total productivity of the country which in turn further accentuates the price-front i e actually adds fuel to the rising price level through shortages of essential goods and services

To achieve industrial peace and step up productivity the general price-level must be kept stable over a considerable period so that working class should not be given a chance to agitate and resort to violence Nevertheless the legitimate demands should be met. Public sector can take the lead and the private sector can follow its big brother Industrialists and Trade Unions should sort out problems amicably This will help improve supply position of goods and services To bring down price level, more attention should be paid to supply side rather than the demand side Gallopping price level is the root cause of all economic maladies in underdeveloped and developing countries Our planning body has to pay adequate attention to this basic problem

Price-level During Five Year Plans

During the First Five Year Plan the general price level did not rise; actually it came down a little due to the favourable weather conditions (good monsoon years) during 1951–55 Production of foodgrains exceeded the target by eleven million tonnes

In fact price level in India started rising during the Second Five Year Plan (1956–60) During this period agriculture suffered a set-back due to three successive bad monsoon years. This led to increase in general price level including prices of industrial raw materials which inflated the cost of production The Index showed that price level was increasing at the rate of 6 to 7 per cent per annum; and this trend of rising prices has not subsided anywhere at any time. The government has been trying its best to arrest the ever rising price level but to no avail. The main reason has been that the government efforts have not been well knit, and in harmony with the economic policy. Therefore, pricing policy must form an integral feature of general economic policy of the country.

While setting up various targets for different sectors of the economy, care must be taken to estimate the real requirements of the country. Alongside stress on financial planning, physical planning should also be taken into consideration. During the first three plans our planners assumed that Indian population would increase by just 1 25 per cent per annum But it rose by more than 2 per cent per annum resulting in shortages in the economy Based on this calculations our demands outstripped the supply causing price spiral.

Our heavy investment in public sector is one of the major causes of rising price level If one takes a close look at the working and functioning of the public sector, one would feel that it should not have been established at all. Excepting a few, almost all the public enterprises are incurring losses year after year They invite general public (tax payers) to make up their losses. In this context I wish to quote our Prime Minister Shri Morarji Desai. He said, "It is unfair to expect the people of India to continue to subsidise losses of most of these projects year after year or ask them to pay prices higher than the landed cost of similar products if they had been allowed to be imported The time has now come when we should take a close and critical look at the performance of the various enterprises and see that their management leads to the fulfilment of the expectations of the people".

The Prime Minister's statement throws a glaring light on the performance of the public sector. What is worse is that these enterprises are not working to full capacity It was assumed that there would be 90 per cent capacity utilisation in these enterprises during the Fifth Five Year Plan. With 10 per cent capacity still remaining unutilised for which investment is already made, the money supply or purchasing power without equal amount of goods and services flowing from this sector, would mean deliberate boosting of demand without corresponding supply. •

Prof. Arekar belongs to Chetna College, Bandra.

The industrial policy of the government is also responsible to a certain extent for price-hike. Undue delays, in sanctioning licenses, etc are some of the factors which prevented our government from following a rational industrial policy. Even wrong strategy and patterns were followed. Small scale and cottage industries were not given sufficient attention. Foreign collaborations were allowed in nonessential and consumers' goods industries Certain industries were set up only to augment the country's economic development, for instance expansion of nylon industry, superfine cloth, T.V. and luxury articles and cosmetic. Investment in these industries created effective demand but the consumers' goods industries did not cope with this demand and hence 'rise in price-level What the government should have done is that instead of encouraging production of non-essential goods, it should have expanded consumers' goods industries which could help stabilise price level

Curb on Non-essential Consumption

Restriction on non-essential or excess consumption is another method of controlling the price-level It is more effective than any other monetary discipline But unfortunately this suggestion which came from the noted economist Prof B.R Shenoy during the second five year Plan was turned down by the then Government He had estimated that by imposing this restriction the government could have saved Rs 5000 million which could then have been utilised for financing more urgent projects, but this suggestion too was not accepted, and excess spending took the price-level up So even today, restriction on excess consumption is as much a need of the hour as it was during the earlier plans. For this, voluntary savings should be encouraged The government should provide attractive alternatives to the people to invest their money.

Excess money supply in Indian economy is yet another ground through which angle rise in prices can be viewed We have executed four five year plans and three annual plans calling for huge investments. The government was required to resort to create money for financing the various projects when it ran short of real resources, Rs. 4200, Rs. 11000, Rs 15000 and Rs. 20500 millions were created duringthe first, second, third and fourth plans respectively. This deficit financing went into the hands of general public in the form of wages, rent, interest and profits causing demand for consumer goods. Thus a situation arose in which lot of money chasing few goods and services came into being Prices started shooting up Deficit financing needs to be curbed drastically, if the price-level is to be cushioned. The compulsory Deposit Scheme, Dividend Restriction Ordinance, Credit Squeeze Policy of the R B I. and the like were resorted to curb the money supply Along with this, our planners should also pay adequate attention to the uncertainties which are the part and parcel of Indian economy Still 50–70 per cent of Indian agriculture depends on monsoons. Setbacks in agricultural production due to erratic monsoons means shortages of foodgrains and industrial raw materials which will inflate the cost of production, thus causing the prices to go up So, we must make sufficient provisions for the uncertainties

A corollary to this is of taking over trade in foodgrains A country which is wedded to socialism cannot afford to keep this trade in the private hands This is a must to wipe out completely black-marketing, hoarding, speculating the adulteration in -foodgrains. It will serve two main purposes. First of all it will protect cultivators' interest and secondly price-level will be kept undercontrol. To support taking over of foodgrain trade, the nationalisation of foreign trade must be undertaken with careful thinking China has proved successful in wiping out deficit in her balance of trade in just a year or two after nationalisation Why not India ?

Last but not the least is limiting the size of family. We must limit our families to curb excess demand in the market Taking into account the present state of resources, India seems to be overpopulated If the same rate of growth in Indian population is allowed to be continued she would soon reach the stage of population explosion For this, people must be properly educated on this delicate issue They must be made aware of this evil so that they willingly accept it as a part of their way of life

In the interest of the country and the people at large internal price-level must be stabilised Economic growth should be achieved through price-stability. It will help invite investments and boost up exports □

The cause and control of obesity are not fully understood. Yet, medical science provides a few answers to the problem. It can be said with certainty that obesity is mostly linked with overeating and less work. So eating optimum rather than excess not only saves food, and in turn money, but saves it for the hungry. Experience shows that obesity is more common among rich people; so much so that some people even think being overweight is a symptom of well-being and prosperity.

Obesity— A Status Symbol

ZAKA IMAM

OUR BODY is a machine that performs various activities to keep alive To perform all those activities energy is needed and the body gets it from the food we eat. The total energy requirement of an individual depends upon age, sex and vocation; and special conditions such as in pregnant women and nursing mothers The energy value of a food is measured in terms of calories—more the body's energy requirement, the more the calories required But if the number of calories provided by food is greater than the number spent in performing daily activities, the surplus energy is stored into the body as fat.

The amount of this extra fat determines whether a person is obese or not. For convenience body weight could be classified into the following types; normal, ideal or desirable. Normal weight is something clinically, absolutely right—no worry. But ideal or desirable weight is the limit after which a certain percentage of additional weight could make an individual obese. The ideal weight, however, depends upon one's frame size—small, medium and large—and naturally his weight varies from person to person, their age and sex. Moreover, there are tables for relating ideal weight to height and frame size, but there is no general agreement among clinicians on this subject Likewise, the question of allowable percentage of excess weight above the ideal weight—for classifying an individual as obese—is also a difficult one But, as defined by a group of nutritionists, an obese individual is one that puts on a weight 10 per cent above the ideal weight for its frame size Some people refer to this condition, however, as overweight and reserve the term obese for those clinical conditions where weight approaches 20–30 per cent above the ideal. There are other means too to determine obesity, for example by measuring skin fold thickness over scapula (shoulder blade) in man and at mid triceps in women. While the concern for some one to know whether he or she is overweight or obese is obvious, it is for the clinician to decide.

Obesity may arise in different ways in different individuals, and the origin is not completely understood, yet. A glance at the various causes would be interesting Though whatever be the etiology or cause of obesity, it represents an imbalance in the whole body energy balance, and its immediate cause is always over-eating There are two things, haredity and environment. And both of them play their part in the development of obesity. A familial tendency for obesity is well documented. The two extremists opinions are: one, the cause of obesity is always over-eating and under-exercising (a curable state); two, it is an inherited disorder due to defects in the biochemical machinery—a state where much cannot be done to prevent the obesity. Researchers have, however, found no correlation between the weight of the parents and their adopted children though their eating habits are similar. Con-

Dr Imam is Assistant Editor, Science Reporter.

versely, the parents weight correlates well with their own children. So eating habits are not the sole cause.

Could there be defects in the body machinery? However, in man, the genetic factors may be manifested through their varied ability to trap body energy—some people being genetically effective to trap body's surplus energy into fat, others being ineffective The varied fat depositing tendency gives rise to two classes of people, easy gainers and hard gainers. The easy gainers are those people whose body is in the biological sense an efficient converter of food into energy, which is stored as fat. Hard gainers do not necessarily eat less than easy gainers, however. But being efficient converters, the easy gainers do however eat more than what their bodies can cope with and thus the surplus energy is stored as extra fat.

There are four possible ways to explain wide differences between individual tendencies of people to fatness. First, individuals vary in their energy requirements; second, the differences in their ability to synthesize and dispose of fats; third, their differences in capacity to store fat; fourth, individual variations in appetite. Metabolically, there are many differences between lean and fat individuals. But it is known that in general these differences are secondary—that is, they occur because of obesity.

To know differences in fat storage among people, it is important to know about special kind of cells, fat cells, which store nearly all our body fat and swell up like balloons The total fat accumulating capacity of an individual depends upon the number of body fat cells and the maximum size that each can attain. Experiments on rats have shown that overfeeding at an early critical period of development leads to an increased number of fat cells which is permanent This favours the idea that people with large number of fat cells are those who have been obese since childhood. And children who have been inflicted with obesity since childhood are therefore hard to be treated.

Scientists working at the Unilever Research Laboratory, Bedford, U.K. have advanced two alternative hypotheses to explain the link between obesity in early age and the intractability of obesity in later life. First, a large fat cell number (whether determined genetically or induced by overfeeding) stimulates appetite via some factors such as hormones. Second, eating patterns established in early life result in increased appetite throughout the life; the early overfeeding though might result in an increase in fat cell number, this increased cell number is not the cause of the continued overconsumption.

Harmful Effects

Some people like being obese, but to be true it is not an advantage but only a disadvantage. For example, obese diabetics are at high risk in comparison to lean diabetics; any surgery is more hazardous to them; childbirth for obese women is less likely to run smoothly and risk of heart diseases and high blood pressure is greater for an obese person Obese persons have a high fat content in their blood which accounts for most of the risks associated with obesity. A reduction in weight is known to improve the general health and life expectancy.

Treatment

As the origins of obesity are complicated and little understood, so its treatment is a problem. There are ways and means of reducing weight and checking obesity but the problem remains there—that is, the tendency for weight to return to its original set point. The way to reduce weight could however be a cut down in the food intake. Mixed low caloric diets are the advisable diet composition[s] [for] this purpose. Sticking to such [a diet] could slowly lead to stored [fat] utilisation and thus weight [loss]. Some authorities suggest high [pro]tein and low carbohydrate and [fat] content in the diet of those [who] desire to reduce. However, the [role] of high protein diet in weight re[duc]tion is not well established [It] has been found that low carbo[hyd]rate content in the diet is no[t as] much important as low fat con[tent]. There is in fact nothing as slimm[ing] food, because nearly all food i[tems] are otherwise fattening if consu[med] in sufficient quantities. To suc[ceed] in slimming, therefore, calls fo[r] regulation in every meal, every [item] in the meal and its daily follow[-up]. That is to say, slimmers need t[o be] weaned into a more sensible pa[ttern] of eating which they can mai[ntain] life long A golden rule ma[y be] to reduce 1 kg of body fat in a w[eek], an amount which has an en[ergy] equal to 7,700 calories and en[ough] to meet energy requirement of [an] average Indian for three [days]. Hence, to reduce one kilogramm[e of] fat means consuming 1000 cal[ories] less per day. In general, to co[ntrol] obesity calls for low fat diet [and] taking calories according to [the] body's needs. This not only s[aves] money, but food for the poor [and] hungry.

A planned weight reduction p[rog]ramme should however be un[der]taken under the supervision [of a] physician.

Power Generation - Some Facts

1. **The installed generating capacity has increased from 10 million kW in 1965-66 to more than 23 million kW at the end of January '77, showing an increase of 130 per cent.**

2. **The power generation in the country reached the record level of 7,824 million units a month in January, 1977, compared to an average of 2,750 million units per month during 1965-66, showing an increase of about 180 per cent.**

3. **Fifth Five Year Plan outlay for the power sector is Rs. 7,294 crores which exceeds the total investment of Rs. 6,6[...] crores made in the first fo[ur] Five Year Plans.**

4. **Till the end of 1976 over 1.[...] lakh villages had been electrifi[ed] and 29.31 lakh pumpsets en[er]gised.**

5. **During April-December 19[...] over 10,700 more villages h[ave] been electrified and about 1.[...] lakh pumpsets energised.**

6. **Since 1970 Rural Electrifi[ca]tion Corporation has sanction[ed] loan of over Rs. 638 crores [for] 1,511 Rural Electrification Pr[o]jects in the country.**

Integrated Rural Development

Yojana is happy to present the second instalment of reader's reaction to Dr V.K. R.V. Rao's thesis on the concept of Integrated Approach to Rural Development as contained in his Sixteenth Convocation Address to the Indian Agricultural Research Institute. Excerpts from this address were published in Yojana dated 15 February 1977 with an invitation to the readers to offer their considered comments on Dr. Rao's suggestions.

Yojana thanks all its readers for the overwhelming response. This forum is closed with this instalment.

Viability Notes on Restructuring Villages

K. K. SINHA

A DEVELOPMENT SCHEME oriented to the needs of the rural areas is being talked about more seriously in recent years[1]. This is necessary to defuse the impact of planning and technology over the vast expanse of rural India Any such plan has to rest on proper sizing of the villages as they are the generating and receiving centres of plan activities, and must have a viable size of their own The 1971 census revealed that 55 per cent of the villages in India had a population of less than 500, i e 100 families, and half of this was less than 40 families No development programme can operate in such small area units, and forces of change can be mobilised only by integrating the villages into bigger units[2]

The issue is not limited to finding the minimum operational size of the villages, but also requires grouping them in a hierarchy of different sizes according to inter-area linkages or flows generating in the rural economy We may discuss here different models of village scatter which are expected to satisfy the norms of viability in a developing rural setup

Dr Rao finds on the experiences of Kerala (where 87 percent of village people reside in villages with a population of over 5000) that a population of 5000 would be an ideal size for a viable village unit[3] But as this might not be practicable for other states, he puts down the limit to 2000 or 1000. He aims at finding an operational minimum but the problem of structuring of villages does not stop here It is equally important to determine the sizes of next higher ranks of villages and their interrelations on a wider area map. This may be termed as the optimal hierarchy of the rural scatter. Further, though the smallest size of the heirarchy is highly suggestive of the main problems in re-structuring of villages, it does not explain why a choice of 1000 or 2000 be accepted for a minimum operational limit This requires some elaborations

We put here a more comprehensive area model implicit in Balwantrai Mehta scheme of democratic decentralisation Starting from the block level as the optimum size of rural administration, the scheme prescribes a size of about 80,000 spread over an area of 150 sq miles within which the panchayat units would form a circle of 4000 population This panchayat size conforms to Dr Rao's choice of an operational minimum, and can be obtained through a union of villages under one panchayat Thus, panchayats become the basic units of the block level hierarchy of villages.

In Bihar the administration found that a Halka of 8–9 thousand population size (with two panchayats as its constituents) would work as an optimal revenue unit under a revenue Karmachari The choice for the panchayat size is made on the coverage capacity of the Gram Sevak who is expected to work as an extension agent for an area of 7–8 kms, while two such units could be combined for the Karmachari. Thus the Halka here is supposed to make a financial optimum size for tax administration

The one merit of the scheme laid down by the Mehta Committee is that it brings distance factor in deciding the optimum operational size of villages Further, it conceives the problem in increasing hierarchy of administration But this approach does not take note of other linkages in the rural area Moreover, it does not decide the minimum size of the village unit itself which would form the panchayat.

A panchayat may mean a combination of 7–8 villages of the size of 500 population each but this size would not respond to the needs of development. Let us suppose that the minimum size of a village should not be less than 1500 population This is a viamedia for the figures suggested by Dr. V K R V Rao This can be justified on the ground that this is the minimum size for village self-sufficiency, i e this would allow a minimum of marketing to the local population with the resources available in the given area limits. Thus this size can be said to be a minimum marketing unit for the rural economy A smaller unit than this would make trades of the village uneconomical This further presupposes that the villagers of this unit have a necessary minimum income (or a necessary minimum of cultivable land, say, 4/5 acres) It also assumes that farmers would not travel beyond this limit for marketing given packet of local needs.

Starting on these assumptions a market hierarchy of village centres can be conceived with different rank of villages with increasing population size, trade needs and distances. This can be said to be the optimum hierarchy over an area map. The minimum unit would be a village of the size of 1500 people with its local market. Now let us say that six such units (with a combined population of 9000 or two panchayats) can give rise to another

Dr. Sinha is with the Dept. of Economics, College of Commerce, Patna.

marketing centre in their midst. This may be called the central village market with a population of 400 or more situated at a distance of 7–9 kms from its satellite units. Let us suppose again that six such central villages create a still bigger centre, the block mandi with a population of 10,000 or more and forming a radius of 17–20 kms with central villages Six such block mandis would feed a Zila market centre which may be a town of 3 lakh population, at a distance of 40 to 50 kms from the mandis.

This gives an integrated view of the net work of village clusters with implied interrelations between various units. Any reorganisation scheme of the rural sector has therefore to view the problem in such compactness. The above scheme can be tabulated.

Market centres	Population size	Market size	Size of different ranks of village centres			Distance
			Lowest	Middle	Highest	
1. Village	1500	1500	1	0	0	3 kms
2. Central village	5000	13500	6	1	0	7–9 kms
3. Mandi village	10000	81000	36	66	1	17–20 kms
4 Zila mandi	3 lakh	86000	216	36	6	40–50 kms

Rationale of the model

In the above model we increase the number of next lower order village by the power of six so that one market nucleus has sixs hadow markets This village scatter pattern in most states is actually too much skewed to non-viable ranks It will therefore be necessary to amalgamate the non-economic units to make the minimum operational sizes and to amalgamate the viable ones into higher rank sizes according to a distance map.

There may not be suoh uniformity in the structure due to topography and concentration of resources. But as there is even distribution of land resources generally the village system would be more nearly even. If the whole village sector shows greater potentials of development, there may be larger sizes of the village centres than in the model and there would be less numerous ranks (as is revealed in Kerala villages.) The poorer the development pull, the smaller will be the size of the centres with more numerous ranks

The rule of six however fits well in the three tier model of democratic decentralisation scheme of panchayati raj and may provide a starting point for village restructuring at each zila level. There may be a need of tresh outlook on this structure after sufficient development stimuli has been generated and the market structure starts changing. In that case the process of change may be partly automatic but some intervention in regional structuring would always be necessary. □

Eradicating Mass Poverty Through Integrated Rural Development

V. C. KOSHY

IN HIS CONVOCATION address delivered at the Indian Agricultural Research Institute, New Delhi (published in Yojana, 15–28 February 1977), Dr V K R V Rao has rightly stated that science and technology by itself cannot solve the problem of rural poverty He has also stressed that it should not be treated as a substitute for a more equitable distribution of productive assets among the rural households, the democratisation of the rural power structure and the creation of necessary consciousness and organisation among the rural poor ensuring their effective participation in the rural development process But, the solution offered by him for achieving the above objective through an integrated rural development approach are rather unrealistic

The strategy for integrated rural development as announced earlier was to provide gainful employment and increase the purchasing power of the rural poor through the application of science and technology It was sought to be achieved by making optimum use of locally available resources such as natural development potential, existing institutional infrastructure and the human resources by way of their participation in the programme This scheme was meant for the poorest of the rural poor, the marginal farmers, with land holdings upto one hectare, landless labour, village artisans and women. It was also intended to enable children to attend school by making it unnecessary for them to be engaged whole-time on income earning tasks

The major deficiency of this programme, however, is the over-emphasis on the technical solutions to the problems of mass poverty, unemployment and backwardness disregarding basic structural imbalances which gave rise to these difficulties. While the natural development potential such as animal, plant, soil, mineral and water are promptly recorded, the socio-economic relationship based on the ownership. If agricultural landed property is conveniently ignored It is necessary, therefore, to bear in mind that technical solutions can only form part of the total economic solution to eradicate poverty and illiteracy.

Dr. Koshy is a Fellow of the I.C A.R , New Delhi

Weak Industrial Base

We are a predominantly agrarian country with 80 per cent of our population directly dependent on land and half of the national income deriving from agriculture The Indian industrial base being weak is not likely to absorb the surplus labour from agriculture in the foreseable future In the agrarian sector, land being the main means of production, the pattern of land distribution would reflect the income level and poverty In a socio-economic system evolved around the inviolability of private property relations, it is the land ownership which determines the economic strength, social status and cultural distinctions which provide the power and influence in a rural society The Agricultural Census of 1971 has shown that 44 per cent of the agricultural population, that is 212 million people, together own only 9 per cent of the total agricultural land. While it covers 51 per cent of the total households, the top 4 per cent held 31 per cent of the operational land in the country Added to it is the 60 million agricultural labourers most of whom do not own any agicultural land and many without even a homestead There are also a large number of unemployed and under-employed living in a precarious condition.

Thus, the vast majority of the rural masses who either do not own any land at all or possessed very little of it are immersed in grim poverty and inequality. There is ample evidence to show that poverty has been continuously on the increase in our country. The number of poor had increased from 220 million in 1960 to 250 million in 1970 and 335 million in 1976 Even this assessment is based on a poverty line drawn on the per-capita monthly consumption expenditure of Rs 27 in rural areas and Rs 45 in the urban centres Similarly, the 27th round of the National Sample Survey 1973, recorded that out of a population of 545 million, as many as 120 million were severe destitutes, 175 million destitutes and 245 million poor. According to this survey, a severe destitute was considered to be one with less than 70 paise consumption expenditure in rural areas and 93 paise in urban areas Likewise, a destitute in the rural areas was one with less than 80 and a poor man less than 93 paise a day The respective figures for urban areas were Rs. 1 13 and Rs 1.43

The alarming dimensions of poverty has been further accentuated due to the rapid increase in unemployment and under-employment Though there are no accurate official figures on unemployment there are sufficient indicators which show that unemployment in India has reached dangerous proportions At the end of the Fourth Plan in 1974, the jobless persons numbered 28 million. At this rate, the Central Employment Directorate estimated the total unemployed to reach 60 million by 1978. It means, about 10 per cent of the population in the country is without any opportunity to participate in the process

---

work the minimum size is 1000 and the distance between these units is 7 kms (with horse transport) The demand list, in preparing the lowest hierarchy, may include a school, a health centre alongwith essential consumption. (For some discussion see, K.K. Sinha, Regional Development and fiscal Policy, under print)

7. For a structural study of panchayats, see K.K. Sinha & Uma Sinha, The Panchayat Strategy. A Developmental Viewpoint, under print.)

f production and out of these nearly /4th belong to the rural areas. his trend is also reflected in the atistics available with the Employ-ient Exchanges pertaining to the umber of registered job-seekers. It as gone up from 25 lakh in 1965 37 lakh in 1970 and 87 in ›75.

'hallenge of Inequality

It is in this light that we have to earch for ways and means to end overty. Our past experiences would how that the ever growing inequa-ty is the biggest challenge for radicating poverty. The Reserve ank Survey on inequalities in asset istribution sharply projects the alar-ning proportions of rural inequality. t shows that 75 per cent of the total ural assets are possessed by the 5 per cent upper strata while the owest 25 per cent of the rural house-olds share only 1.3 per cent The hare of the asset value of 50 per ent of rural households is a mere per cent. Hence, the gap between he rural rich and poor is so vide that it cannot be bridged by asy means The study emphasises hat since land held by the rural households account for the bulk of assets, distribution of land would be a prime factor in any scheme of *eduction in basic inequalities* But t's findings also reveal that efforts o reduce inequality through land reforms have not made any notable mpact

Under the existing semi-feudal agrarian structure in the country, he landlords, money-lenders and other vested interests take away the bulk of the produce from tenants, the minimum wages are not assured to the agricultural labourers and credit facilities and other imple-ments are not within the easy reach of marginal farmers. Hence, they cannot improve their economic position rather they are being further pushed down below the poverty line.

As a consequence of this relation-ship, the rural masses suffer different types of inequalities which vary from infrastructural to technical. The pattern of land ownership, the prevailing values in social relation-ship, the cultural lag between the elite and masses, etc are in the first category. On the other hand, technical inequalities and back-wardness are the by-products of infrastructural problems. They are lack of employment opportunities, technical skills, drudgery, under-employment and the like.

Therefore, a viable solution for minimising poverty should begin with eradicating basic maladies which have arisen owing to the structural imbalances It is ignored and solutions are to be found for the more technical difficulties, as being done in the integrated rural deve-lopment programme, then the pre-vailing structural relationship would continue to pose more problems than can be solved. Thus, a more equi-table distribution of the means of production should form the basis for any real solution. Agricultural property being the main source, *land reforms must be an integral* part of the scheme for rural deve-lopment.

Looking at it from this pers-pective, Dr. Rao's proposals do not seem to contain any real solu-tion to the basic problems involved Although he has mentioned issues such as re-distribution of rural assets, the necessity to break-up the rural structure and the need to organise the poor, his main emphasis has been on less important factors like the re-structuring of Indian villages on population basis, etc. This he thought would make a viable unit for absorption of the integrated rural development programme. The size of population considered by him as ideal for this purpose was 5,000.

Application of Technology

Even accepting, theoretically, that a given size of population in a definite area with certain natural develop-ment potential may be ideal for the application of science and technology, it should be borne in mind that conditions do not exist in the villages for not only shifting the population but even for changing their boun-daries. It would be impracticable to reorient our villages for the sake of applying the relevant tech-nology even for developmental pur-poses On the other hand, a more practical approach would be to adapt the technological innovations to suit the local needs and conditions. In any case, there should not be attempts to disturb the prevailing village set-up without being able to provide sustainable alternative programmes for rehabilitating the rural population.

Prof. Rao is also against accepting a 'census' village as the minimum basic unit for the programme of integrated development. But in the *20 districts selected for the integrated* rural development programme such a yardstick has not been used. It is not a village but a cluster of villages in a district which are con-sidered to be the most backward with a certain developmental infras-tructure that have been chosen to form the base for this scheme Similarly, the projects designed are not for any particular village as such but for a well-defined occupa-tional category who will form the human component of it Therefore, it is not the size of the village which is important but the capability of the project to successfully absorb the participant groups with a reaso-nable cost

He is also not in favour of distri-buting the surplus land that may be accrued from the landlords among the landless agricultural labourers. Instead he wanted it to be given to the marginal and sub-marginal farmers in order to make up their holding in to an economically viable one rather than adding to the number of marginal farmers It is true that the average size of an operational holding in this category is only 0.41 hectare, but there are a total of 36 million holdings which cons-titute more than half of the total households. As the land which is

likely to become available for distribution being meagre, it will not be sufficient even to convert a sizable number of marginal holdings into economically viable ones. On the other hand, if it is distributed among the 60 million landless agricultural labourers, it may give them a place to construct a hut and even some space for growing vegetables, etc. to meet their minimum daily needs Moreover, the possession and ownership of a patch of land, however small it may be, would give the landless rural poor some relief and a confidence to strive for a better living

Prof Rao has also touched upon the basic connection which exists between development and effective and motivated participation in the developmental process by the vast body of rural poor Taking up the case of marginal and sub-marginal farmers, he has rightly argued that such participation is possible only if there is a fundamental change in the existing rural power structure in regard to the utilisation of the facilities created by the government for rural development, and a radical alteration in the existing structure of ownership of land and other productive assets among the rural population Unless some radical steps are taken to bring about a more equitable distribution of the pattern of land and other productive assets in the rural areas, it would be difficult to bring about either integrated rural development or the abolition of poverty in rural India

Land to the Landless

The significance of utilising science and technology for developmental purposes cannot be underestimated Rather, its role and relevance for achieving progress and prosperity will have to be given due recognition It is a healthy trend that our scientists and technologists have began realising their rightful role in contributing to the economic advancement of the down-trodden people especially in the villages But what needs to be clarified is that the application of modern techniques and methods in the field will have to be linked with a programme for more basic solutions to the problems of the masses and it cannot be done in isolation. Therefore, it is necessary to take steps to ensure radical changes in the agrarian structure along with rapid development of household, small and large-scale industries

In the agrarian sector, the most pertinent issue is the distribution of agricultural land to the landless farm workers together with the implementation of other land reform measures. Once this is assured, it may be comparatively easier to arrange for the regular supply of implements necessary for modern farming such as improved seeds, insecticides, manures, and irrigational facilities. The farmers would also require timely and easy credits. The agro-industrial corporations, the co-operatives and the nationalised banks can assume responsibility to equip the farmers particularly the vulnerable sections with modern implements and other assistance The Agricultural Universities along with other scientific institutions all over the country can take up the challenging task of imparting training in skills not only in modern techniques for augmenting production but also from the point of view of the overall socio-economic and cultural development of the people

So far as land reforms are concerned, there are three different spheres of this programme. They are the abolition of intermediary rights on land, tenancy reform and fixation of ceiling on agricultural land holdings, take-over and distribution of surplus land among the landless agricultural labourers. In the post-independent India, legislations were enacted for all these in almost all the states, though it widely varied in content as well as in implementation Of the three different spheres of reform measures, a greater success has been achieved in abolishing the intermediary interests in land such as the zamindari, inamdari and jagirdari However, the huge compensation paid by the Government to the big landlords amounting to Rs 670 crores for abolishing the intermediary interests alone defeated the very purpose of breaking up the monopoly in land and concentration of wealth in the hands of a few individuals.

The tenancy reforms cover different aspects like providing security of tenure, fixation of fair rent and conferment of ownership rights on the cultivating tenants Though a plethora of legislations were enacted in several states, the implementation of it has been hopelessly lagging behind. Besides lack of security of tenures, forced evictions, concealed tenancies and several other arrangements such as share-cropping are widely prevalent throughout the country. The rent collected from the tenants is also enormously high in spite of the legal stipulations to charge only 1/5th or 1/4th of the total agricultural produce.

Slow Land Reforms

Of the several measures of land reforms, an issue of far reaching consequence is the restriction imposed on the ownership and possession of agricultural land and assignment of the surplus land to the landless labourers and poor peasants. According to an estimate made by Dandekar and Rath in 1970–71, the extent of surplus land in the country was put at 43 million acres. But as a result of the efforts made by the states over a decade only 12 5 lakh acres of surplus land could be distributed until 1972. The operational land in the country being 400 million acres, the land distributed formed a negligible 0.3 per cent. In five states, Andhra Pradesh, Bihar, Karnataka, Orissa and Rajasthan, not a single acre was taken over for distribution

The slow progress made in the land reform front on the one hand and the growing unrest among the landless labourers, share-croppers and tenants on the other had built up the pressure from below sufficiently high that the Congress Government at the Centre was forced to react quickly It was in this background that the Chief Ministers as well as the Central leadership decided in favour of revising the ceiling laws and paying lip service regarding its implementation The fresh directive recommended for lowering the ceiling area, redefining the family unit and removing some of the exemptions granted earlier But the implementation of these legislations also met with the same fate as that of the earlier ones Thus, the Congress Government had failed in bringing about any reduction in the wide disparity of land ownership in the country. On the contrary, the land concentration in a few hands has actually increased in states like Punjab and Rajasthan simultaneously with all the efforts to reduce it.

Exploitation of the Poor

Given the situation in the countryside, any programme for the upliftment of the rural poor will have to be carefully designed So long as the rural poor are allowed to remain subservient to the economically powerful people in the villages, the landlords, money-lenders and other intermediaries, who take away a major share of their earnings, the benefits accrued from the new investment will also easily fall into their hands. The same vested interests who have deliberately kept the people

away from the means of livelihood will not allow a programme for their rehabilitation to succeed as they would loose their grip over those whom they have been exploiting for long.

No doubt, the first non-Congress Government assumed office at the Centre is fully committed to end mass poverty, unemployment and illiteracy. This promise made to the people through the election manifesto has, been reiteraated in the Presidential Address delivered to the joint session of Parliament on March 28, 1977. Shri B.D. Jatti has categorically told the members that the new Government is pledged to the removal of destitution within a definite time-frame of 10 years The Acting President also assured that his Government would follow an employment-oriented strategy in which importance will be given to the development of agriculture, agro-industries, small and cottage industries especially in rural areas High priority would also be given to the provisions of minimum needs in rural areas and to integrated rural development.

These pronouncements have been spelt out in more detail in the manifesto of the Janata Party. For instance, the Party has a 'Dynamic Approach to Rural Development' under which the whole concept of Integrated Rural Development undergoes radical changes The new approach is to make agriculture itself more productive through proper land and water conservation and utilisation, agrarian reforms, mixed farming, animal husbandry, aquaculture, and the organization of agro and rural-based industries Therefore, in this scheme of things, land reform is a part of the programme for rural development and not outside it.

On the question of land reforms also the manifesto has categorically stated that the Janata Party is committed to agrarian reforms covering tenurial relationships, ownerships and consolidation of holdings. The party noted that owing to the tardy and insincere implementation of land ceiling legislation, the available surplus land declared, much less distributed, has been pitifully small It assured that the Janata Party will honestly implement land legislation, provide machinery for scrutinising fraudulent transfers and dispossession of and plug such loopholes as have come to light. Landlordism is to be abolished and the surplus and other reclaimed lands be distributed among the landless, particularly Harijans and Adivasis.

Two Pronged Attack

In view of these commitments and considering the urgency of the situation, the Government will have to quickly chalk out ways and means to alleviate the sufferings of the people. It will be easy to undo the political climate and fear created among the people by the previous Government. But the differences are going to surface when it comes to the hard economic choice. Removal of poverty and unemployment would much depend upon how fast the economy is developed and in what direction? It is both the rate of growth of the economy and the nature of growth that will have to be carefully regulated. In our country's pursuit of economic development during the last several decades, a large section of our people in the bottom category have been left far behind even without the basic necessities for a reasonably better living. It is these people who should now receive the primacy attention from the Government.

This can be achieved by a two-pronged attack through rapid agricultural as well as industrial development. Since the agrarian sector provides the essential infrastructure necessary for the immediate advancement, it has to be utilised without loosing time so that a large section of the rural population can occupy themselves in gainful employment. Much of the problems of rural poor can be solved on a long-term basis by giving them either land to cultivate or alternative avenues of employment, assuring fair wages to agricultural labourers and by relieving them of their debt burden which they have inherited from the past Therefore, the Government should move fast to implement the land reform measures which are already existing in the statute books first and in due course may modify them A quick and effective implementation of the land ceiling laws and distribution of excess land to the landless along with a portion of forest and waste lands can provide the basic infrastructure required for assuring a minimum livelihood to the bulk of the rural poor. It will release the creative energies of the people engaged in agriculture and thus, increase food production This will also ensure increased supply of raw materials to industry and expand the industrial base which can absorb the idle labour from the agrarian sector

Nevertheless, poverty cannot be eliminated through land reforms alone. The effort in the land reform front will have to be sufficiently supplemented by setting up agro and rural based industries as envisaged under the integrated rural development plan. A long-term solution would obviously lie in rapid industrialisation. Along with large and medium industries which are necessary for a sustained economic growth, the cottage and small scale industries will also have to be given proper attention. Only these industries can quickly absorb a large number of the currently unemployed people. Large capital-intensive modern factories have to be developed especially to provide basic supplies for the growth of the industria[l] units and of agriculture, but th[e] plan for such expansion must b[e] tempered with an awareness tha[t] for quicker expansion of both em[-]ployment and production a majo[r] emphasis has to be given to impro[-]ving cottage industries. Further, th[e] big and medium size industries whic[h] are of strategic importance for [a] balanced industrial advancement wil[l] have to be placed in the publi[c] sector.

The industries producing mas[s] consumption goods should invariabl[y] be run by the cooperatives and i[n] the public sector as far as possible It should be streamlined by streng[-]thening and extending an efficien[t] public distribution system This wil[l] help in a big way to keep the price[s] under control and reduce the mal[-]practices of hoarding and black marketing often resorted to by th[e] monopolists Elimination of th[e] chain of middlemen on trade wi[ll] also check the price fluctuations an[d] manipulations

The intense application of scienc[e] and technology will become mor[e] relevant in such a situation. Th[e] science and technology complex[es] modelled for the integrated rur[al] development programme would ac[-]tually form the nucleus of econom[ic] activity especially in the inaccessibl[e] areas These work-centres can the[n] cover the diverse needs of the com[-]mon people which vary from agr[i]culture to trade and health an[d] educational problems. The technolo[-]gical innovations would further be[-]come a boom to widespread us[e] of it for national reconstructio[n] Thus, an integrated rural develop[-]ment programme evolved on th[e] basis of such a socio-econom[ic] foundation can form the real alte[r]native for building up a sociali[st] society. 1. The water of the Luni river is
   (*a*) Sweet
   (*b*) Salty
2. Who said, "Prisons are built with stones of law, brothels with bricks of Religion".
3. Who is the first Indian to swim the English Channel?
4. India's first dairy plant that started to process and pack milk in disposable polythene bags is at
   (*a*) Pune
   (*b*) Rohtak
   (*c*) Mandi
5. Which hydro-electric project will utilise the combined flow of Siul, Baira and Bhaledh rivers?
6. Decipher the abbreviations
   (*a*) WWW
   (*b*) SCI
   (*c*) NSSO
7. Kerala High court is at:
   (*a*) Trivandrum
   (*b*) Ernakulam
   (*c*) Cochin
8. How many players make-up a basket ball team?
9. How many waves are there in a beam of light?
10. How long do the following animals live?
    (*a*) Golden Eagle
    (*b*) Tiger
    (*c*) Giant Tortoise
    (*d*) Monkeys
    (*e*) Lizards
11. What is Schnorkel?

Answers

1. The water of the Luni river is sweet as far as Balotra, then it is brackish and by the time the river reaches its mouth the water becomes quite salty. 2. Blake in "proverbs of Hell" 3. Shri Mihir Sen, 4. (*c*) Mandi, Himachel Pradesh inaugurated on the 21st September, 1972. 5. Baira-Siul hydro-electric project. It will generate 180 MW. 6 (*a*) World Weather Watch, (*b*) Shipping Corporation of India, (*c*) National Sample Survey Organisation, 7. (*b*) Ernakulam, 8. Only five. 9. The number of waves a second in a beam of light varies according to the colour. The number of waves a second for some of the colours: Red 400 million millions; Orange 437 million millions; Yellow 509 million millions; Blue 696million millions; Violet 750 million millions. 10 (*a*) 104 years, (*b*) About 19 years, (*c*) 200 years, (*d*) 30 years, (*e*) 31 years (sometimes) 11. The Schnorkel is a device which enables a submarine to prolong its stay beneath the water. It was first used in 1944 by the German Navy.

Quotation Box

I have always respected the opposition even when I was in the Treasury benches. But after sitting in the opposition, I am now more convinced than ever that not only should the Government respect the Opposition but should also behave in a manner that the Opposition must behave.

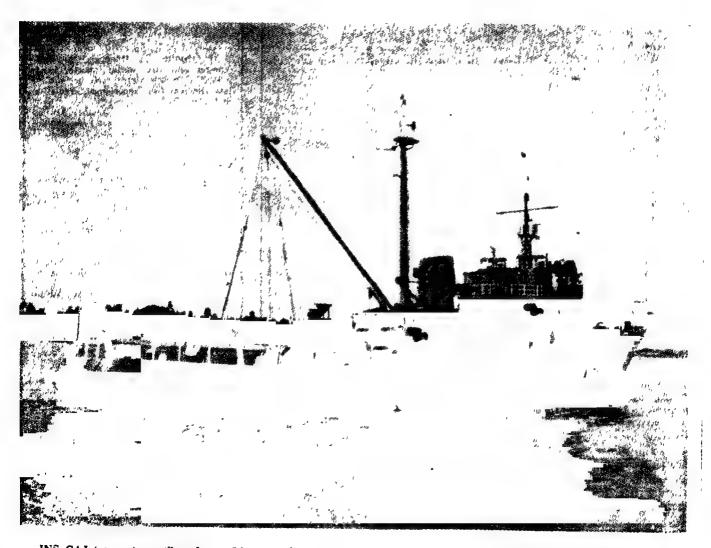
We all agree that pessimism is a marhk of superior intellect
..Professor J.K. Galbraith

GARDEN REACH—

From Workshop to an Industry

IT WAS IN the second half of the 19th century when a small workshop was started on the east bank of the Hooghly, south of Calcutta, with a river frontage of almost a kilometre. The workshop known as Garden Reach Workshops was set up primarily for the purpose of repairing the ships calling at the Calcutta Port It has steadily grown over the years and was taken over by the Ministry of Defence, Government of India in 1960. Since its takeover, GRW has acquired the finest specialised equipment and skills to emerge in the Indian sub-continent, as one of the leaders not only in the ship building and ship repairing industry but also a pioneer in designing, manufacturing and commissioning of highly sophisticated equipment and systems for various industrial complexes being set up in the country.

Fittingly renamed recently as Garden Reach Shipbuilders & Engineers Limited, it has now the capacity to build medium size ocean-going ships, large and sophisticated tugs and dredgers of various kinds and other specialised ships, largest capacity diesel engines in the country, provide systems engineering and equipment for conveyor systems and manufacture sophisticated equipment for various industrial complexes in the country With the increase of its diversified activities over years, the strength of its manpower has increased from 4280 in 1961 to nearly 9500 in 1976 in its eight plants located in Calcutta, Ranchi and Nagpur. The majority of these employees are professional engineers and highly trained technicians with long experience. The main yard of GRSE covers an area of about 20 hectares Here it has two building docks and three shipways supported by structural and fabrication shops, grey iron and non-ferrous foundries and machine shops with the most modern machinery and equipment. The diesel engine unit is located at Ranchi while its mechanical unit is at Nagpur


INS GAJ the most versatile and powerful ocean going tug with a ballard pull of 40 tons built by GRSE for the Indian Navy.

P. B. RAY

Calcutta Correspondent

The growth of the workshop is henomenal not only in respect of s increasing diversified activities ut also in terms of its value production. From a little over Rs. 20 million in 1960–61 the value of its roduction has increased to Rs. 392 nillion in 1975–76 and is expected o reach Rs. 511 million in 1976–77. According to the latest Annual Report 1975–76, GRSE not only achieved record production during he year giving growth rate of 34 per cent over the previous year, but also became a profit making unit fors the first time in many years. A tatement of production for the last 5 years is given below to indicate he steady growth of GRSE

The total value of fixed assets of GRSE are well over Rs. 210 million. With fully subscribed and paid up capital of Rs. 140 million, it has also launched an expansion plan at an additional cost of Rs. 140 million. Under the plan one of the existing dry docks has been converted into a building dock for construction of large ocean-going ships up to 28000 DWT; a fitting out jetty, shipbuilding structural equipped with electronic plate cutting machine, an optical drawing office and a large grey iron foundry have been built. As a result of the radical changes during the last decade, an infrastructure has been

built with the most sophisticated technological equipment and know-how.

Ship-building

There has been significant progress made in the sphere of ship-building by GRSE during the last few years The value of ship construction has increased from Rs. 39.3 million in 1972–73 to Rs 163.9 million in 1975–76 and is expected to rise to Rs 222 5 million in 1976-77. The most outstanding venture of GRSE in this direction is to start construction of the first of the three bulk carriers of 26,000 DWT to be built for the Mogul Line Ltd. The unique features of these bulk-carriers are .

(a) For the first time a large ocean-going vessel has been designed in this country without foreign collaboration
(b) Eighty per cent equipment will be indigenous
(c) The carriers will be able to call at all ports in the country. GRSE has also received orders for bulk carriers from the India Steamship Co Ltd , a privately owned shipping Company.

Besides building merchant ships, GRSE is giving support to the needs of the Indian Navy. Three Seaward Defence Boats are under construction at the yard This boat fitted with modern sophisticated equipment is a high speed Naval Craft for constant

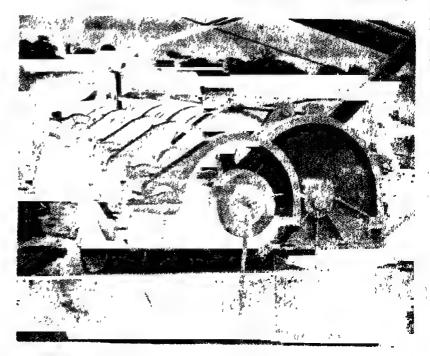
patrolling and harbour defence duties This is the first major effort to produce an indigenous warship tailor-made to the requirement of the Indian Navy. GRSE has also built for the Indian Navy the most versatile and powerful tug, 'INS GAJ' ever built in India with a ballard pull of 40 tonnes INS Sandhayak, the first of a series of three survey ships that will be built for the Indian Navy has been recently launched. This survey ship will be employed in the important task of Hydrographic Survey and also some limited amount of oceanographic work.

Recently a hopper barge has been converted into an Oceanographic Research ship, R V GAVESANI, the first of her kind ever built in the country. This Oceanographic Research Ship has been recently delivered to the National Institute of Oceanography, Goa. She is completely redesigned and fitted with all sophisticated equipment providing air condition accommodation for 50 of the crew, 19 scientific personnel, separate refrigerator stores for domestic provision and scientific materials and five laboratories. A flume stabilizer tank has been fitted to the ship for the first time in India. This is a new area where GRSE has acquired expertise knowledge in designing and constructing Oceanographic Survey and Research Ships to meet the need of the country.


l by GRSE for National Institute of Oceanography.
itted on board manufactured by GRSE.

The biggest Dredger, MAHA-GANGA built in India for the Calcutta Port Trust was launched in May 1976. The construction of this Estuarine Dredger with a length of 140 M and capability of dredging to a depth of 20M and with a hopper capacity of 7500 tonnes of spill in 75 minutes marks a significant achievement of GRSE. Eighty per cent of the equipment being fitted is indigenous. GRSE has also completed the delivery of the five Twin Screw Kort Nozzle Harbour Tugs built for the Calcutta Port Trust.

Ship-repairing

Regarding ship-repairing, GRSE has got the technical knowhow and experience of undertaking repairs of all kinds of various types of ships including warships, which can come into Calcutta harbour The value of ship-repairing work has increased from Rs. 24.6 million in 1972–73 to Rs. 35.2 million in 1975–76. In 1975-76 as many as 321 vessels/crafts were attended to. The repairing work included the major refit to INS Krishna, for the Indian Navy and extensive repairs to M.V Chanakya, 'Rama, 'Deshdeep', 'Andamans' and 'Kalinga'.

The need for ancillary machinery and equipment that are required to be fitted on board of a ship has been felt for a long time. In its relentless effort to manufacture those equipment and machinery as a drive for import substitution, GRSE has made use of specialised skills to manufacture those engines and machinery and equipment It has pioneered the indigenous production of Marine Diesel Engines and Deck Machinery in India

(a) *Marine Diesel Engine* · Plants have been set up in Ranchi and Calcutta to manufacture diesel engines. At present GRSE is manufacturing slow speed, medium speed and high speed diesel engines which are used for main propulsion, as generating sets (stationary and marine) and as marine auxiliary engines These engines have been supplied to many shipyards for main propulsion of ships and to commercial organisations for use as generating sets These engines are being fitted with ships being built by GRSE

(b) *Deck Machinery* With a view to meeting the need of ancillary equipment required for the normal operation of shipboard systems, GRSE has embarked on the production of deck machinery items like windless, capstan, steering glass etc. in collaboration with Messrs. AEG of Hamburg. West Germany. In addition to the items covered by this collaboration GRSE has developed and manufactured special dredging machinery. control winches and ladder winches for cutter suction dredgers, barge loading and barge warping winches and suction type hoisting winches for dredgers and constant tension winches for tugs, towing hooks, life boat launching gears, deck cranes and electric equipment for deck machinery

A view of Asia's heaviest conveyor system built by GRSE at Visakhapatnam outer Harbour.

General Engineering

The activities of GRSE are not confined to the field of ship building and ancillary equipment but also cover the manufacture of the items in the general engineering field In order to meet the growing demand in the country for indigenously developed sophisticated technological equipment and structures for atomic research, steel plants, chemical plants, process industries, and for engineering services needed by industrial complexes coming up in various parts, GRSE has expanded its activities significantly in this direction The efforts have helped to save a considerable amount of foreign exchange. The work handled by the General Engineering Department of GRSE ranges from estimation, designs (including import substitution), planning and manufacture to the actual commissioning of the equipment at the site A highly sophis-

icated "Resonator Tank" for Bhabha Atomic Research Centre and accessories for their Variable Energy Cyclotron Project at Calcutta have been manufactured by GRSE

Steel Plant Equipment

GRSE has recently made significant progress in the manufacture of sophisticated technological equipment for steel plants, fertilizers and chemical industries and refineries A bulk order for 8000 tons of technological equipment has been completed for the first phase of the construction of the country's biggest steel plant—Bokaro Steel Limited in Bihar. A repeat order for 6500 tons of similar equipment is currently under execution for Bokaro's 2.5 million ton and 4 million ton expansion programme. In addition, it is executing work for other steel plants like Bhilai and Rourkela Units of Hindustan Steel Ltd

(b) *Material Handling Equipment:* GRSE has recently started manufacturing conveyors to meet the requirements of the Coal Mines Authorities, National Mineral Development Corporation, Neyveli Lignite Corporation and Visakhapatnam Outer Harbour Project. The 1800 mm wide, 1.8 km long conveyor having a capacity of 8000 TPH has been recently commissioned for carrying over burden in the open cast mine of Neyveli Lignite Corporation Ltd. For transporting iron ore at the rate of 8000 tons per hour the 9 km conveyor system, Asia's largest and heaviest conveyor system for Visakhapatnam Outer Harbour was commissioned in December 1976. In fact, it is the second largest conveyor in the world.

With expertise gained over the years, GRSE has developed the latest crane technology. It is already one of the India's leading manufacturers of steelmill duty cranes without foreign assistance. It has manufactured Wharf, Goliath, Level luffing and other types of cranes It is the largest supplier of EOT cranes of capacities ranging from 5 to 50 tons to Bokaro Steel Ltd Cranes up to 100 ton capacity have been manufactured by GRSE. It also manufactures special crane attachments such as motorised grab units and double barrel grab buckets with capacities as large as 5 3 cubic metres.

GRSE also manufactures Fork lifts with a carrying capacity of 2 to 3 tons. These Fork Lift trucks are powered by Perkin Diesel Engines. These are entirely indigenously developed and not dependent on any imported components.

(c) *Miscellaneous Engineering Items :* GRSE offers pumps, both vertical and submersible, built on sound technical knowhow acquired through long experience and extensive research spread over 20 years. These pumps have the capacity range from H5 litres, 20,400 litres per minute. These are suitable for use both in tubewells in size of 95 mm to 600 mm and open wells. Rotary Air Compressor made by GRSE has been widely accepted for its superior features such as large capacity low discharge, smooth operation, light weight, compact design and simple construction. Pressure vessels and heat exchangers and equipment allied to process, chemical petro-chemical and fertilizer industries are also manufactured by GRSE. The 8 to 10 Ton Road Roller made by GRSE is now extensively used for building roads, dams, airport runways and other compaction duties.

Exports

The efforts and activities of GRSE have greatly contributed to the saving of valuable foreign exchange by way of import substitution. It is now taking active part in earning foreign exchange by exporting many engineering items to the foreign countries. Recently GRSE has supplied transportable bridges to neighbouring countries and earned foreign exchange to the tune of Rs. 30 million A large number of Garden Research Deepwell Turbine Pumps have recently been exported to the Middle East countries Substantial orders for these pumps have also been received from Bangladesh and Srilanka GRSE has also supplied Road Rollers to Libya

The journey from a mere workshop to an Industrial Complex may be a long one associated with initial pangs and constraints of diversification but full of exicting achievements. In less than a decade the face of the workshop has undergone a radical change. The organisation which was a mere ship-repairing workshop a few years ago has been turned into a shipbuilding ship-repairing yard and a medium heavy engineering unit in the eastern region of the country with a brighter future ahead. □

The Concept of Lokpal

S J SORABJEE

Good Government is the aim and the ultimate justification of any State which stands for the welfare of its citizens.

The hallmark of a welfare State are :-

(1) integrity of administration. This implies absence of corruption and improper conduct;

(2) efficiency and effectiveness of administration. This can be ensured in two ways. Firstly, by eliminating administrative procedures or practices governing administrative action which is unreasonable, unjust and oppressive and, secondly, by eliminating negligence or undue delay in taking administrative action The laws delays and the incidence of office are the source of many an ill of the citizens, and last but not the least securing the liberties of the citizen in a prompt, inexpensive and informal manner

Experience shows that the success of a good government is closely linked with a high degree of civic consciousness We have recently had an outstanding example of the political consciousness and maturity of our people which should dispel any doubt or cynicism about their civic consciousness which is very much there and wants to assert itself, if only citizens had a trusted friend and protector

The institution of Lok Pal and Lok Ayukata may well provide the answer. "OMBUDSMAN is a Scandinavian institution Sweden was the first country to adopt it in its present form in 1899, followed by Finland, Denmark and Norway New Zealand, a common law country with a parliamentary form of Government, voted for it in 1962, and England adopted in 1966." Historically, in each of these countries, the mechanism has been adopted with one aim in view, viz to control the activities of, and prevent abuses by, official and administration after it was realised that the existing mechanism and procedures were inadequate for the purpose.

The Indian experience is no different. There has been oft-expressed public outcry against the prevalence of corruption, the existence of widespread inefficiency and the unresponsiveness of administration to popular needs The general belief in India is that officials and ministers are not to be trusted The average citizen rightly feels that questions put in Parliament, writing letters to his M.P. or to Ministers are not of much help, that the available judicial remedy is neither adequate nor efficacious in many cases because courts are hide-bound by limitations of procedure and technicalities Besides, very few can afford the high cost of litigation from court to court.

The Indian citizen like nationals of several other countries have the right of appeal against ministerial and official corruption and inefficiency. This function can be performed by the Lok Pal who should have investigatory powers to look into grievances.

What has been the Indian response? Way back in August 1966, the Administrative Reforms Commission in their Report suggested the adoption of the Ombudsman type institution in India.

A Bill was introduced in the Lok Sabha on May 9, 1968 to implement the recommendations of the Commission It was passed by the Lok Sabha, but while it was pending in the Rajya Sabha, the Lok Sabha was dissolved and the Bill consequently lapsed

A new Bill on similar lines was introduced in the Lok Sabha in August, 1971 This also lapsed on dissolution of the Fifth Lok Sabha.

Orissa, Maharashtra and Rajasthan are some of the States which have enacted laws on the same lines as the Central Lok Pal Bill

The Central Bill provided for the appointment of a Lok Pal by the President after consultation with the Chief Justice of India and the Leader of the Opposition in the House of the People. This is a salutary provision meant to ensure the confidence of Parliament in the Lok Pal. The term of office provided was 5 years. The Lok Pal could only be removed by the President on the ground of mis-behaviour or incapacity and on no other ground, and the procedure for his removal was the same as that prescribed in the Constitution for the removal of a Supreme Court or a High Court Judge. Under the Central Bill, the Lok Pal had authority to investigate any action taken by the Minister or a Secretary or any other public servant. The main work of the Lok Pal, as envisaged in the Bill, was investigatory and not adjudicatory. If after investigation the Lok Pal is satisfied that the complaint of corruption or mal-administration is justified, he is empowered to make a report recommending to the public servant and the competent authority concerned that such wrong shall be remedied within a certain time. If the Lok Pal is not satisfied that appropriate action has been taken on his recommendation, he can make a special report to the President. Furthermore, under the Bill, he has to present annually a consolidated report to the President and the President is required to lay both these reports before each House of Parliament These two bills, though not perfect, were steps in the right direction I would suggest that in a future law on the subject the restrictions placed regarding the areas into which the Lok Pal cannot inquire should be reduced and in fact effort should be made to make his teeth a lot sharper. Besides, serious thought must be given to include the Prime Minister also as one of the persons in to whose conduct the Lokpal can enquire. Let us not forget that it is of public importance that the public men failing in their duty must be exposed and then face the consequences either in Parliament or in a court of law

One of the strong objections urged against the establishment of a Lok Pal is that it would conflict with ministerial responsibility. This objection is ill-founded. In the first place, there is no principle which requires that the Minister must have exclusive responsibility for investigating the lapses of his Department. Administrative justice de-

Shri Sorabjee is Additional Solicitor General of India

non-political system of investigating individual complaints against the powers that be. This is exactly what ministerial responsibility does not provide. Lok Pal and Lok Ayukta would certainly be thorns in the sides of the powers that be. But that surely cannot impair the principle of ministerial responsibility. It would rather ensure accountability.

Furthermore, experience has shown that not all Members of Parliament are effective grievance men. The growth of party discipline and the prominence of partisan attitudes in defending the performance of governments, tend to create an unfavourable atmosphere for the calm consideration of individual complaints and of the best ways for dealing with them.

Commissions are often appointed under the Commission of Inquiries Act to inquire into actions of various Ministers, for example, the Das Commission inquired into the affairs of the Kairon Ministry in Punjab. No one suggested that this was a violation of ministerial responsibility.

The other objection that Lok Pal would encroach upon judicial functions of the courts is also untenable The essential features of Lok Pal are to investigate, criticise and in some cases to publicise but not to reverse administrative actions The purpose of Lok Pal is not to adjudicate but to provide regular machinery for investigating grievances against the administration in a discreet and informal way In fact, it is the informality of approach which is one of the main advantages of this system Besides, it is precisely because courts of law are unable to provide relief in several spheres that the Lok Pal steps in. Take for example the fundamental right of equality and non-discrimination guaranteed by our Constitution. The equality principle is the basis of every civilized society and in our country where pulls and prejudices on account of caste, creed and religion operate powerfully, the need to weed out discrimination is paramount. The court's powers, however, are limited because the guarantee of non-discrimination can be enforced only against the State which, as defined by the Constitution, means Central or State governments and local authorities and bodies exercising quasi-governmental powers. Consequently, courts are unable to do anything about the prevalance of discrimination in public institutions such as universities, hospitals, statutory corporations and bodies performing public functions and duties. This is precisely where the Lok Pal should look in. The future law on the subject should make adequate provision for these situations so that civil liberties do not remain parchment promises but are experienced as living realities More-over, the Lok Pal is not the monarch of all he surveys with his right there being none to dispute. In appropriate cases, should he over-step his limits, he can be brought within the supervisory jurisdiction of the Supreme Court and if there is any doubt about this, a provision can be made to that effect.

Lok Pal is not only curative, but also preventive. He does not only give relief to the aggrieved citizen, but also induces more care in the administration in taking a decision In short, he keeps the officials on their toes Also, to the extent the Lok Pal holds a large number of complaints insubstantial, to that extent the image of the administration is improved, the faith of the public is redeemed and the administration stands vindicated. The public remains satisfied. Even if no relief can be given in a particular case, the mere fact that an independent authority has reviewed the matter gives great satisfaction to the complainant In many cases in other countries, the Ombudsman has found that the complaints arise because the complainants fail to appreciate reasons behind a particular administrative decision and if the same are explained to them they feel satisfied. The Lok Pal, therefore, has an important public relations aspect. The crisis of confidence between the administration and the public could be the negation of good administration and the Lok Pal seeks to avoid it.

The success of the institution will depend greatly on those who are called upon to discharge the function for it is they who, more than the legislative enactment, will really carve the place this institution is to occupy in our system of government. It person selected should be one who is known for his sturdy independence and fair-mindedness. Accordingly, it would be eminently desirable that no active politician is appointed to this office, because, as the age-old dictum reminds, us, justice must not only be done, but must manifestly seen to be done.

The two Bills introduced in Parliament did not provide for any qualification for the person to be appointed as Lok Pal. The Lok Pal will have to deal with many points of law in the course of his functioning. Though it is not necessary that the person to beappointed should have been a practising lawyer, it is necessary that he should have had some legal education—which is the requirement in Scandivanian countries—and that he should be in the opinion of the President a distinguished jurist—which is the same qualification as required for the appointment of a Supreme Court or a High Court Judge.

We rightly cherish Milton for his immortal sonnets and his great epics, but we tend to forget that it is also Milton who with visionary perception, uttered these words in in his *Aeropagitica* He said :

> "For this is not the liberty which we can hope, that no grievance ever should arise in the Commonwealth—that let no man in this World expect, but when complaint are freely heard, deeply consider'd, and speedily reform'd, then is the utmost bound of civil liberty attain'd that wise men looks for."

One of the wisest and noblest men in our country Shri Jayaprakash Narayan in his recent broadcast to the nation said that the establishment of an autonomous body that may be known as Lok Pal was his first expectation from the Government. The citizens of India have waited long and expect the Government to fulfil this expectation without any further loss of time, and thereby strengthen democracy and generate a clean political life in our country.

Among the much-talked of tax reforms in developing countries the Value Added Tax has come to occupy a prominent place. It has materially benefitted the tax structure in many developed and developing countries and has also led to more efficient use of capital and human resources in these countries

VAT AS A TAX REFORM

SUBHASH J. RELE

VALUE ADDED TAX (VAT) has had a chequered and interesting career. It took birth in 1954 first in France. It emerged as a result of the French authorities continuous improvisation with their sales tax structure. The countries in the European Economic Community adopted it as part of their fiscal harmonisation programme, which created great interest in this form of taxation throughout the world. It was introduced in the U.K. in 1972 and despite opposition, it was selectively introduced in the U.S.A. in 1973. In India the Central Excises Reorganisation Committee (1968) itself recommended a detailed study of the French model of VAT "with a view to exploring the possibilities of re-modelling the excise tariff structure in India when conditions for it are more favourable."

What exactly is VAT?

The idea of VAT is very simple. Unlike a multi-stage turnover tax or excise duty, VAT is applied to the value of a product everytime it is sold in the process of production or distribution. It is assessed at each stage only on the increase in value acquired by the production since the last taxable transaction. Under this system of taxation, "the sum of the values added at each successive stages is equal to the final price of products and the sum of the tax paid at each successive stages will be the same at the tax which would be payable if it were charged on the full value of the final product and collected as a single payment." *The essential features of the VAT is that it makes it compulsory for a manufacturer or trader to preserve all ingredients of the document of expenses in an accurate form as to be able to claim rebate for taxes paid by him earlier on his input.* It is the most productive form of sales tax employed in the developing countries. Its revenue varies between 10 and 30 per cent of Government revenue and exceeds about 2 per cent of gross domestic product.

Shri Rele is Editor 'Industrial Times'.

The tax due by a business firm is computed by applying the relevant rate to total sales during a given period, deducting from the result the amount of tax already paid by the firm in buying intermediate products and capital equipment. In principle, however, the VAT is conceived as one that extends to the retail stage and to virtually all sectors of the economy, including services. In some of the developing countries it departs considerably from the European model of a comprehensive, relatively uniform, neutral taxes on the consumption of goods and services. It is significant that all of them employed the tax credit device in applying the value added principle. Services are normally taxed in all these countries except in Brazil and Ecuador.

As an Alternative to Excise Duties

The VAT can be introduced as an alternative to excise duties or sales or corporate profit tax, or even as a supplement to each or all of them. In our country excise duties have become very predominant in the financial weaponry of the Union Government. They have been yielding the highest absolute amount of revenue as well as the highest preparation of the tax revenue. In 1940–41 the relative significance of Union excise duties as percentage of total revenue was 4.70 per cent; today it has jumped to 68.50 per cent (Budget Estimate). The number of commodities has increased from 5 in 1940–41 to 75 in 1975–76. The major question is: Will VAT do away with most of the complexities associated with the existing system of excise duties? Since VAT is ad valorem in nature, the presen[t] combination of specific/ad valore[m] excise will disappear. Secondl[y,] though VAT is multipoint tax [it] is not cumulative in nature, henc[e] the elaborate system of exemption to mitigate the multipoint effec[t] of excise duties will cease to exis[t.] Thirdly, it eliminates physical supe[r]vision at various stages of productio[n.] This is considered to be an advantag[e] since it facilitates the extension [of] the tax to a greater variety of com[]modities without adding too muc[h] to the cost of administration.

Replacement for Sales Tax

Most of the countries that hav[e] so far adopted the VAT have don[e] so in place of sales tax of some kin[d.] These have either been a multip[le] stage gross turnover or single stag[e] sales taxes at the manufacture [or] wholesale or at the retail leve[l.] In view of their complexities sal[es] taxes in India cause annoyance an[d] hinderance to the free flow of goo[ds] both within and between the diff[e]rent States. All the disadvantag[es] attributed to the cumulative turnov[er] taxes in general are applicable [to] multipoint sales tax. The VAT [is] a sales tax levied on the value adde[d] to a product or service each tim[e] it changes hands. This makes [it] quite akin to the single stage sal[es] tax as far as its impact is concerne[d.] Hence it is preferred by many cou[n]tries. The oft-repeated argume[nt] that VAT is difficult to administ[er] does not stand scrutiny and pa[st] experience. The countries whic[h] had adopted it found it difficu[lt] only in the initial stages. The co[st] of collection was not heavy compare[d] to the advantages it could give.

Substitute for Corporate Profits Ta[x]

Many in our country have no[w] veered round the view that VAT [as] a substitute for corporate profi[ts] tax has innumerable merits. A[s] early as 1955 a study by TA[]

Quarterly pointed out that several anomalies in our corporate profits tax could be rectified by the introduction of VAT. It said:" VAT when applied to corporations differ from the VAT when applied as indirect tax on commodities in one significant respect. When used as an indirect tax on commodities, the residual value added on which the tax is levied, is arrived at by deducting from gross sales the value of the purchase of raw materials, power, fuel etc. on revenue account. When VAT is sought to be introduced as a substitute for the corporate profits tax, the value added is calculated by deducting from gross sales not only the purchase of materials on revenue account but also depreciation Therefore, if VAT were to substitute the existing corporate profits tax system, the base liable for taxation would embrace not only profits but salaries, wages, interest charges and rent as well Under the corporation tax, the base is only "profits" whereas under the VAT the base is value-added Under the corporate profits tax, since the tax is levied only on profit, the less efficient firms which make no profits, but use national resources are spared, but the firms which make profit by an efficient utilisation of national resources are penalised. Again, even among the efficient firms the more efficient have to bear the tax at the same rate as the less efficient firm In effect this means corporations that are not profitable get a tax advantage relative to those that are profitable This is not fair to the profitable and more efficient corporations By adopting the value-added as the base, all the units will come under its purview, irrespective of whether they make profits or not"

Efficient Utilisation of Resources

From this the argument follows that VAT particularly in a country like ours will lead to efficient utilisation of capital and human resources. It will naturally bring about an increase in the net capital formation in a country by releasing investible resources to the efficient or to the more efficient sectors of the economy. It will give special encouragement to the management of corporations to economise on their expenditure particularly on wages and salaries It also provides an incentive to economise in the consumption of raw materials as well. One great advantage as far as India is concerned is that under VAT the corporations will be discouraged from indulging in a variety of wasteful expenditures as they are tempted to incur under a heavy corporation tax No tax system can compete with VAT in certain built-in advantages. For the efficient corporations incentive to invest will increase as they will be able to retain a larger share of the profit made from such new investments; simultaneously, their capacity to save will grow as lower tax rates will enable them to save more in the form of retained profits Their dividend-paying capacity will also improve. VAT falls on imports but exports are exempted Like purchase tax, VAT is not only charged directly, but unlike purchase tax, provides machinery for rebating tax entering indirectly into export costs If adopted in India, it will make our exports competitive in international markets thereby leading to an increase in export earnings. This will help improve our balance of payments position.

VAT automatically provides opportunities for cross-checking because each tax-payer is legally liable for the full amount of the tax and can reduce that tax liability by proving that tax has been paid on his purchases Since the tax is collected in fractions at different stages of production and distribution, there is less temptation to evade it

RBI Study

The Jha Committee and our policy-makers can take relevant lessons from an empirical study published in the recent issue of the Reserve Bank of India Bulletin. The study concludes that the tax on value-added in lieu of corporation tax, or a supplement to corporate profit tax is a relatively more feasible proposition under the existing Indian conditions than VAT (it calls it TVA) as a substitute to sales tax or excise duties. The study argues that the introduction of VAT as a supplement to corporate profit tax can be relatively less cumbersome and it would be a tax with high-yielding potential as a small change in the rate can be expected to yield large revenue to the Exchequer The study discussed some general problems which have to be tackled when thinking of actually introducing this tax reform in India First although the developed countries avoid taxing investment goods, this may not be an advantageous policy for developing countries like India. The study feels that the VAT suitable to Indian conditions need not be of the capital-exempting type, but rather of the type which would encourage labour-intensive production techniques. Second, there may be need for special provisions for small businesses. Large numbers of small tax payers can be kept outside the purview of the tax by excluding these sectors where they predominate. Or, alternatively, small businesses can be either exempted or can be assessed differently on the basis of a simplified system.

Third, an efficient administration of VAT needs backing by a suitable system of tax-payer registration. The developed countries are experimenting with better registration and numbering system using electronic computers, and simplified payment and collection procedures through the use of postal cheques or 'gire' system The study observes that well-conceived VAT based on the invoice system and backed by proper registration system can, besides introducing efficiency in the administration of tax, provide an amazing set of financial data on the inter-sectoral transactions within the economy

Overhaul of Taxation System

There is a widely held view that the introduction of VAT in India will entail a complete change "not only in the existing philosophy of corporate taxation but also in the approach to Indian economic growth" The Jha Committee will have an unenviable task in recommending the tax base which will be satisfactory and equitable So also determining a particular type of tax whether consumption, net income or gross profit. Though consumption type is adopted in many developing countries it may not be suitable for India Another poser would be Should VAT cover the agricultural sector? If so, how? Another difficult task would be that of how to strike a better balance between the yield from direct and indirect taxes without reducing the Government's revenues Since VAT is a comprehensive tax, reliefs reduce revenue and complicate administration The significance of this must not be lost sight of by the Jha Committee In fact, it would be advisable to lay down stringent criteria for reliefs Some classes of transactions can be given reliefs by subjecting them to a lower rate of tax than the standard rate

Other Side of the Coin

Doubts have been expressed in certain circles that the VAT, if introduced in a country like India, may

(*Contd. on page* 37)

TECHNOLOGY FOR SMALL FARMERS

I. J. NAIDU

AS BULK of the masses in India live in the country side the main hub of planning process has been agricultural development, other activities of rural development being built around it, ever since the beginning of the First Five Year Plan. Various steps have been taken to achieve the objective of higher agricultural production and it can be said that the first major step taken in this direction was the launching of the Intensive Agricultural District Programme (IADP) in 16 selected districts spread over 15 States during 1960–62. Alongside the IADP, another programme known as the Intensive Agricultural Areas Programme (IAAP) was taken up in 117 districts in 1964–65 During mid-sixties,a major break-through in agricultural production was achieved by the introduction of High Yielding Varieties Programme, which was launched on a large scale from Kharif 1966 in an area of 730 thousand hectares under conditions of assured water supply. This strategy has resulted in more than doubling the food production in the country compared to the level in 1950–51. This is obviously a result of combined efforts of planners, scientists, extension workers and the farmers. While there is no doubt that agricultural production is on the increase, it has also been realised that the gains from technology went mostly to the well-to-do farmers, who not only had easy access to technology but also to credit which enabled them to get higher yields per hectare of land The result was that disparities in rural incomes were accentuated by way of big farmers getting richer and the small farmers not getting their share of the benefits of this Green Revolution.

The All India Rural Credit Review Committee set up by the Reserve Bank of India which submitted its report in the year 1969 pointed out these lacunae and suggested that specific measures be adopted to concentrate on the weaker sections of the farming community. The Committee made a comprehensive analysis of the data available from various sources and came to the following conclusions :

"It is, therefore, all the more necessary that the less affluent cultivators should be enabled, through state and institutional support, to improve their production potential and levels of income by adopting improved agricultural practices. If the fruits of development continue to be denied to a large section of the rural community, while prosperity accrues to some, the resulting tensions, social and economic, may not only upset the process of orderly and peaceful change in the rural economy but even frustrate the national efforts to step up agricultural production".

The Committee, therefore, suggested that special agencies may be set up in the country, to first of all, identify (a) special problems of the small farmers as producers, (b) the means by which they can be helped to overcome the handicaps and render their farm economies viable and commercial, and (c) the arrangements by which these means can, in fact, be provided.

The recommendations of the above Committee formed the basis for a large programme of small and marginal farmers development taken up in the country during the Fourth Plan period. This Committee also outlined the approach to be adopted and the efforts to be made in dealing with the problems of small farmers in these Agencies. To quote the Committee, "This effort is obviously restricted to those cultivators who can be developed into surplus farmers if they adopt improved techniques on the basis of support in terms of supplies, irrigation, services of machinery etc. Appropriate schemes have to be drawn up by technical experts with reference to local resources and requirements, so that such cultivators can undertake specific line of investment (e.g. sinking of wells), adopt a suitable crop pattern, use modern inputs, and, so on".

It was on the basis of the above recommendations that Small Farmers' Development Agencies were set up to deal with their problems by formulating specific programmes for crop husbandry, subsidiary occupations and other related activities in order to improve their incomes. Alongwith these SFDA schemes, it was, felt that Marginal Farmers and Agricultural Labourers Agencies should also be set up with accent primarily on subsidiary occupations and employment generation as they could not achieve viability through crop production alone The first full year of working for all these projects can be taken as 1971–72 though some were set up earlier During the IV Plan, 46 SFDA projects and 41 MFAL projects were set up in the country Each SFDA had an outlay of Rs 1.50 crores and was expected to cover approximately 50,000 identified small farmers. Each MFAL project with an outlay of Rs. 1.00 crore was designed to cover 20,000 marginal farmers and agricultural labourers. The Project had a five year period of operation starting from 1971–72.

There has been a shift in the approach to the problems of small farmers and marginal farmers in the Fifth Five Year Plan. This has come about mainly due to the recommendations made by the National Commission on Agriculture in their interim Report on Re-orientation of Programme of Small Farmers, Marginal Farmers and Agricultural Labourers Development Agencies The examination by the National Commission was in the context of securing social justice and equality of opportunity for the poorest of the weaker sections by ensuring their effective participation in the stepping up of agricultural production. The Fifth Plan objective of reduction of poverty was also kept in sharp focus On the basis of the recommendations of the National Commission on Agriculture the changes introduced in the SFDA MFAL programmes in the Fifth Plan relate to (i) merger of SFDA and MFAL Agencies to have a composite Agency catering to small farmers, marginal farmers and agricultural labourers in the same area of operation, (ii) emphasis on crop husbandry, with subsidiary occupations being superimposed in selected districts. Under a separate Centrally Sponsored/Central Sector Scheme of the A.H. Divn. in the Unio

Shri Naidu is Secretary, Department of Rural Development, Ministry of Agriculture and Irrigation, New Delhi

Deptt. of Agriculture, (iii) adoption of area approach for implementing some of the schemes like land development, soil conservation, irrigation and water harvesting techniques to extend benefits to small/marginal farmers with subsidies from SFDA funds, and (iv) provision of necessary infrastructural facilities like extension support, processing, marketing and storage and custom service by the State Govts. supporting such activities out of their plan funds

The programme of small farmers development is only a part of the overall objective of helping the weaker sections to increase their incomes The problem however, is of a much greater dimension if one looks at the total population which comes under the category of small and marginal farmers, i e those owning less than two hectares, as can be seen in Table I

TABLE—1

Size group	No. of Operational Holdings (Millions)	%	Area in Ha. (Million)	%
Marginal (Less than 1 ha)	35 7	51	14.5	9.00
Small 1–2 (Hectare)	13.4	19	19.8	12.00
Total All size	70 5	100	162 1	100 00

(*Source* -*Agril Census Report* 1975)

It would thus be seen that nearly 70 per cent of our agricultural holdings are operated by small and marginal farmers covering between them only 20 per cent of the total area cultivated. The existing 160 SFDAs aim to cover 10 million or 20 percent of the total small and marginal farmers in the country In addition to the magnitude of number, the problem is accentuated by the fact that most of these farmers, particularly those in unirrigated areas, live below the poverty line. The majority of the small and marginal farmers are reckoned as being below the minimum standard of consumption of Rs 20 per capita per month at 1960–61 prices, and Rs. 37 at 1971–73 prices (Source NCA Report) In such a situation the need for a strategy of development for this category of farm families cannot be overemphasised Increasing inequalities in the levels of income of different sections of the rural society are bound to generate social tensions and retard our efforts to achieve our goal of growth with social justice.

Besides the efforts directed towards the development of small farmers in the 160 SFDA project areas in the country, similar approach has been adopted under other Central Sector/Centrally Sponsored Schemes like Drought Prone Areas Programme, Command Area Development Programme and Tribal Area Development Programme In these projects also the respective agencies are making available subsidies to small/marginal farmers and agricultural labourers on various developmental activities as in the SFDA areas Thus, there is an all prong drive to improve the economic level of the weaker sections in the rural areas by involving them in the developmental activities. There is no denying of the fact that increased productivity leading to higher income and increased employment opportunities is dependent upon the following four crucial pre-requisites.

(i) Appropriate technology and its transfer to farmers

(ii) Efficient input supply system including credit,

(iii) Adequate processing, marketing and storage net work, and,

(iv) Well developed extension service

Whereas all the above factors would help in increasing productivity on the farm, among them development and transfer of technology can be considered as the basic requirement before the other factors come into play to help increase production. There is no doubt that scientific knowledge in the field of agriculture has made significant advances in the past decade or so, particularly after the advent of the high yielding varieties of paddy, wheat and hybrids of jowar, bajra and maize Although, the Green Revolution resulting from the adoption of high yielding varieties has, by and large, benefited the bigger farmers, it has been established beyond doubt that the new technology is neutral to scale and that small farmers have been able to produce results comparable to those obtained by bigger farmers through rational use of various inputs What is really needed is the proper transfer of new technology to the small farms supported with other measures like supply of inputs, arrangements for marketing, processing and above all, suitable extension support

New Technology cannot be taken as static In fact, the scientists and technicians are constantly engaged in reviewing the new technology in the background of agro-climatic conditions obtaining in different parts of the country with a view to bring about further refinements for achieving best results The role of agricultural egineers cannot be underrated in this kind of exercise as they would be connected with all the farm operations right from the preparation of the land up to post harvest technology Agricultural engineers and scientists, therefore, need to work in close collaboration to review the adoption of the new technology with reference to any given set of agro-climatic conditions.

With the modernisation of agriculture, introduction of high yielding varieties of seeds, multiple cropping and adoption of dry land farming techniques farming now requires full time attention of the cultivators, whether big or small. The cycle of various operations, for example, land shaping and levelling, optimum utilization of water, lay-out of field for irrigation, placement of seeds and fertilizers, spraying and dusting of pesticides, etc. do not really leave much time to the farmer, and, in fact, make it more difficult for him to manage all the operations in time in view of the demand for labour during peak periods This necessitates mechanisation of operations to a certain extent without displacing agricultural labour from the rural areas, ensuring simultaneously that all the necessary farm operations are carried out in time according to recommended schedules Farming in India is carried out under varying agro-climatic conditions and involves a wide range of operations and management practices. Agricultural engineers have a crucial role to play in the development of agriculture whether under irrigated or rain-fed conditions. Whereas some of the small/marginal farmers have limited animal power, others do not have even that source of power and have to depend on their neighbours. Therefore, mechanical contrivances would be wel-

comed by small farmers provided the investment is modest and it is possible to acquire them by obtaining credit from institutional sources. Keeping the above in view, the approach will have to be for selective mechanisation of small farms to get over the problem of labour shortage during peak periods. Development of suitable farm implements and machinery for adoption on small farms has to go hand in hand with the transfer of connected technology to the small farmers The extension organisation at the field level is no doubt charged with this responsibility but it is necessary that the agricultural engineers continue to feed such an organisation with the latest information to help in the modernisation of agriculture If this vital link is not established development of farm implements and appliances would remain confined to the agricultural workshops

Another important aspect to the transfer of technology to small farmers is to provide necessary infrastructure of servicing, maintenance, repairs and supply of spare parts in respect of power operated as well as animal drawn agricultural implements and equipment. It has to be admitted that though much attention is being paid to the manufacture of implements, etc very little is being done for their proper repairs and maintenance A small farmer can ill-afford to run often to the city to get his equipment repaired for the simple reason that he does not have the financial resources or the time to do so It is, therefore, imperative that such facilities are provided up to the last point This can be achieved only through efficient after-sales service in the rural areas.

There are many farm operations like tractorisation, land levelling, harvesting, threshing etc, which it may be difficult for a small farmer to carry out on his own and he would be happy if any organisation could help him in carrying out such farm operations on payment of service charges Although the State Agro-Industries Corporations have been providing facilities of this nature they have not still percolated to many of the interior areas. The Agro-Service Centres set up by young entrepreneurs have been rendering useful service to the farmers but even their coverage is limited for the present. Much more remains to be done in this regrad

The task of improving productivity of small farms and improving the economic level of the weaker sections is a stupenduous one Agricultural engineers have a crucial role to play in this task This all-India Seminar on "Technology for Agricultural Development" may like to consider the various problems with special reference to transfer of technology to small farmers

The following specific issues may be taken up for discussion by the Seminar

(i) Modernisation of agriculture on small farms depends upon proper transfer of new technology. Problems in this connection with reference to agricultural implements and machinery require to be considered.

(ii) New technology is not static. A constant review of the technology in respect of different agro-climatic conditions is necessary. How can this be done ?

(iii) In view of the labour shortage during peak seasons and non-availability of animal power, small farmers require suitable mechanical contrivances. The implements and equipment have to be simple and within the reach of small/marginal farmers. What can be done in this connection ?

(iv) Extension organisation should be constantly apprised of the latest information in the development of agricultural engineering How can such a link be established between agricultural workshops and the extension organisation ?

(v) Provision of suitable infrastructure for servicing, maintenence, repairs and supply of spare parts in the interior areas—present status and further improvements that need to be brought about

(vi) Provision of custom service to small/marginal farmers—adequacy or otherwise of coverage by Agro-Industries Corporations and Agro-Service Centres by entrepreneurs and further extension of this facility □

IGNORAMAN

wants to know whether the rule of the few by the fewer for the fewest can be called caucusocracy.

PROFITABILITY OF PUBLIC SECTOR

1. **The gross profits of Public Sector Undertakings before interest and tax increased to Rs. 668 crores in 1975-76 from Rs. 146 crores in 1970-71, constituting an improvement of 290 per cent in a period of six years.**

2. **The net profits of the Public sector undertakings before tax increased to Rs. 306 crores in 1975-76 from only Rs. 20 crores in 1970-71 recording an improvement of over 1400 per cent. The net profit after tax in 1975-76 was Rs. 129 crores as against a loss of Rs. 3 crores in 1970-71.**

3. **The number of manufacturing group of industries which recorded 75 percent capacity utilisation was 69 in 1975-76 as against 45 in 1973-74.**

4. **The significant production increase was in the steel units which changed the entire position from one of chronic deficit to a comfortable surplus enabling some to be exported.**

5. **1975-76 was a year of record production for coal. Total production crossing over 10 million tonnes mark with production in the Central public sector alone being 89 million tonnes.**

6. **The capacity utilisation in a number of IOC refineries was well over 100 percent. The engineering industry increased its range and output significantly.**

"Let there be wealth out of waste."

Hindustan Lever Research and Technology have turned a forest waste into an international product with several crores per annu of export potential—and created seasonal jobs for Adivasis.

Until a few years ago, the Sal forest was a subject for poems and pictures and little else besides.

This picture started changing for the better once Hindustan Lever's Research scientists started work on it. And an enterprising forest contractor offered to organise collection of Sal seeds in the wilds of Orissa

Sal fat is today processed and exported as a cocoa butter extender to give the special melt-in-the-mouth property, so valued by chocolate makers of the world

Today our enriched Sal fat exports fetch crores of foreign exchange per annum Potential for exports could be doubled, provided the prices are competitive internationally And it provides seasonal employment and income in backward areas for thousands of Adivasis. A good example of transfer of wealth through technology from the chocolate consumer in Europe to the Adivasi in Orissa.

Relevant Research turns yesterday's waste into today's wealth.

Hindustan Lever Ltd.

Relevant Technology for the Millions

CMHL-2

BEEDI WORKERS OF MADRAS CITY

A Socio-economic Survey

Conducted By

The New College Planning Forum, Madras

MADRAS, THE FOURTH largest city of India, covers an area of 143 square kilometres. According to the 1971 Census, its population is 2,470,288. The people are employed in various industries both small and large. The beedi industry is one of the cottage industries which has been flourishing in the city for over 60 years. Beedis made in Madras are exported to a number of foreign countries. The socio-economic set-up of beedi workers is entirely different from those of other workers.

This survey was conducted by the New College Planning Forum, Madras. It lasted two months and 64 students took part in it. They were divided into eight groups and each group was under the charge of a senior student of the Post-Graduate class. The entire work was directed by Mr. Syed Badre Alam, Vice-President of Planning Forum and supervised by the principal and president, Prof. H Md. Mohideen.

The members covered 1126 families of both North and South Madras. The divisions surveyed are (1) Royapettah, (2) Triplicane, (3) Washermanpet and (4) Perambur Barracks, where majority of the beedi workers reside.

A detailed questionnaire covering various aspects such as income, employment, literacy, savings, expenditure, indebtedness, family planning, knowledge of five year plans etc. was prepared. A majority of the beedi workers barring few exceptions showed enthusiastic interest in supplying the data.

Analysis of the Data

In the manufacture of beedis the raw materials required are tobacco, beedi leaves, thread and labels. These are provided to the workers by the factory owners. The total equipment of the beedi workers, which is quite simple, costs only Rs. 9.

It was found through survey that 1126 families had a total population of 5868. Of them, 2732 were males (53.6 percent) and 3136 females (46.4 percent).

The following interesting figures were obtained from an analysis of the data procured

Number of earning members	No. of families	Percentage of the total families surveyed
1	297	26 4
2	609	54.1
3	133	11.8
4 and above.	87	7.7

In 54.1 percent of the families husband and wife work together. Only 26 4 percent of the families depend upon the earnings of one person and the average size of such a family consists of 6 persons and its whole income is spent for consumption alone. In 19.5 percent of the the families i e. 220 families, it was found that even children and old people are employed.

The survey revealed that most of the workers received tobacco leaves, thread and labels from the beedi factories. They work in their own residential areas with no time limit. Some families commence their day's work early in the morning and finish it off in the evening. Every day they get their wages for their output. The family is the unit, and they all work together irrespective of sex and age.

Size of Income

The following table points out the monthly income of the families surveyed:

Amount of monthly income	No. of families	Percentage of these families to the total families
Income upto Rs. 100	146	13.0
From Rs 101.. to 200	492	42.8
From Rs. 201 to 300	384	34.8
From Rs. 301 and above	104	7.4

From the above figures it can be noticed that 87 percent of the families earn more than Rs 100 per month. The average monthly income per family is Rs. 216 There are 18 families who get an income of about Rs 600 but the number of members employed in that family is on an average 4 They get daily wage on piece rate basis A worker usually makes 1000 to 1500 beedis a day. In some cases production is 2000 a day but the worker has to work for 16 hours

The average income of the family reveals a state of abject poverty. The Beedi workers unlike others, do not get any bonus and there is no security of employment or any other source of income for them. If they work, they get income, if they do not work due to illness or other reasons, they have to starve. The system of wage rate is piece rate. For each 1000 beedis made they are paid Rs. 3.50 to 4.50 depending on the size of the beedi. Even after working for 16 to 18 hours a day the wage one gets does not exceed Rs. 10 Their condition is pathetic indeed.

For most of the families there is no subsidiary source of income. But for 87 families beedi work is a subsidiary source of income. For the rest of 1039 families beedi making is the main source of income.

Level of Literacy

It is revealed that among the families surveyed 48 percent of the males are literate. But in case of females the percentage of literacy

is only 11 percent For both the sexes, the average percentage of literacy comes to 28 2 percent. 26 heads of the families who have studied upto S.S.L.C. are engaged in beedi work. Some of the families employ children from 8th year onwards in beedi making. These boys are not sent to schools In reply to a question, the parents said, "no money, no food, no clothes". These children supplement the family income

Of the 1126 families surveyed, 948 families are Muslims Out of the 948, 814 families are Urdu speaking Muslims and the rest are Tamils. 6 Christian families are engaged in beedi work. About 112 families belong to scheduled caste The rest are caste Hindus

Housing

Out of the 1126 families surveyed, only 186 families live in their own houses The remaining 740 live in rented houses The average rent paid by them is Rs 28/- per month

Since the houses are one roomed, there is no privacy It is pathetic to see a single room being used by 9 members for cooking and sleeping

There is no pucca street, most of them are lanes Some of the lanes in Washermanpet area are filthy and full of rubbish surrounded by gutter water Some of the members of the survey team hesitated even to entering these areas

Of the total families surveyed only 112 families have got separate latrines and bathroom facilities A majority of them share common bathrooms and latrines.

Of the total dwelling units surveyed but for 216 houses the rest are not electrified, the reasons being low income and most of them being without proper walls Hence, most of the families use kerosene lamps. For cooking 227 families use kerosene stoves, and others use fuel

Only 203 houses have proper ventilation. The remaining have no ventilators, no doors or windows Some of the entrances are so low and narrow that one has to bend down to enter. The pond near the graveyard used by the beedi workers for washing their clothes is a breeding ground for mosquitoes

Of the families surveyed only 46 families have got their own taps, others get their drinking water from the Corporation taps

Savings and Indebtedness

The survey revealed that only 54 out of 1126 families make some savings The amount of saving ranges from 5 to 10 percent of the income 42 families have invested their saving in jewellery. Only 22 families have got account in the banks and post offices.

Majority of the families revealed that they are deeply immersed in debts During the days they remain idle or are sick, they generally live on borrowings It is disheartening to note that 72 percent of the families borrow money from pawn brokers The security provided by them is either brass vessels or silver ornaments. Six families stated that they even pawned sarees to get a loan Most of them confessed that they never redeemed the mortgaged articles 11 percent of the families revealed that they pay an interest of Rs 10 for every Rs 100 borrowed One family stated that it pays an interest of Re 1 every week, on Rs 10 borrowed

Pattern of expenditure

The following table points out the average percentage of expenditure incurred by the families surveyed

	Families with monthly income upto Rs. 300	Families with monthly income above Rs. 300
Rice	64	60 6
Wheat	4	6
Millets	2	Nil
Provisions	6	7
Tea	6	5
Fuel	6	6.7
Recreation	3 4	5 8
Rent	6 6	6 5
Other expenditure	2	2 4

The figures reveal that almost all expenditure is unproductive and mostly spent on necessities

Eighty two percent of the families reported that they often visit cinemas during the weakends The main recreation therefore to them is cinema and 62% of the families visit Hindi Cinemas 29 families have radio sets and 16 families have got transisters

It has been observed that 58% of the families are in the grip of narcotics including chewing of tobacco.

Family Planning

Only 642 heads of the families responded to our queries on family planning Others were reluctant to answer Of the 642 families 126 are in favour of birth control, and the rest disliked or even criticised the idea of birth control. Some of them are in the habit of using oral pills or contraceptives and some adopt self-control. Some believe that child is the gift of God and to prevent it is a sin. Some of the family members are reluctant to undergo vasectomy and tubectomy operations 15 families are not at all aware of the family planning programmes Six families have already adopted family planning, and undergone vasectomy.

Of the 1126 families surveyed only 86 families know about the Five Year Plans Only 246 families are aware of the proclamation of Emergency.

Suggestions

The above analysis reveals the pathetic condition and the numerous problems faced by the beedi workers of Madras

To improve their lot it is necessary that beedi workers must form co-operative societies. Government agencies must provide adequate finance, and also help them in the formation of co-operative societies It is surprising that the co-operatives department has not so far made any attempt in this direction

Regarding the child labour, proper directions through legislation can be given to the workers that no boy or girl below the age of 18 be employed in beedi work The boys and girls must be sent to schools

It was observed that most of the workers are unhealthy. It is because of their low income and also because of their working conditions It is amazing to note that the Tamil Nadu Slum Clearance Board which has cleared a number of slums, has not done much to benefit the beedi workers The living conditions of Papu Masthan Durgah and also beedi workers in Washermanpet are in no way better than the other slums which had attracted the attention of the slum clearance Board It is therefore, suggested that the Tamil Nadu Slum Clearance Board must come to their rescue and help them to live decently.

Considering the amount of time devoted and the job undertaken the rates paid to them are very low. It is suggested that their wages must be enhanced from 4 to 4.50 per 1000 beedis to atleast Rs. 6 to 6.50 per 1000 beedis. The government can also fix a minimum wage in consultation with the management and the workers

(contd. on page 36)

A Utilitarian Estimate of Scavengers of the Sky

AMIT BANERJEE

ONE MAY shudder after reading Daphne Du Maurier's spine-chilling horror story 'Birds' or after seeing its portrayal by Alfred Hitchcock on celluloid. But frankly speaking, there is nothing so ghastly about these feathered creatures When we leave aside Maurier's figment of imagination and look at bare facts, we find that birds help mankind in many ways Whether as killers of insect pests, rats and other vermin, or as scavengers and seed carriers, they perform several useful functions

Jean Henri Fabre, the French naturalist said hundred years ago that but for birds, famine would kill 75 per cent of the people in the world Birds are mainly responsible for keeping the insect and locust populations in check Insects proliferate very quickly. The colorado-beetle, which is also found among Indian crop pests, would without check increase to 60 millions in a single season. The scourge of the locust in well-known Large locust swarms are sometimes so thick that the sun is blotted out They cause immense damage to standing crops and an average swarm eats more than a million kilogramme of food each day Then there are certain flesh-feeding larvae, who consume 200 times their original weight in a single day

Birds help farmers by capturing myriads of insects harmful to crops The bluet it, which is one of the smallest birds in the world, catches 6 million insects in a year. The smallest bird—the humming-bird, also consumes huge quantities of insects. The wood-peckers destroy caterpillars, wood-boring beetles, sap-sucking aphides and other insects which lark in tree crevices. Another featured tribe–the night-jars devour the flies and insects which flutter around the udders of goats and cattle It is easy to imagine the losses that farmers would suffer if these birds were not there

Shri Banerjee is a free-lance Writer.

With the advent of winter, birds leave the cold north and migrate to warmer haunts in Africa and Asia Some of them, like the swallows and the storks cover enormous distances during their migratory flights By fixing numbered rings to the birds' legs, their migratory routes have been traced out by ornithologists

The migrants are not only great fliers but are also great insect-eaters A swallow flies 400 miles a day and devours, as it flies, innumerable winged insects Most of the other migrants–the wrens, warblers, robins and swifts capture their food while on the wing In order to meet the energy requirements for swift aerial movement, they feed on insects at regular intervals from sunrise to sunset

The rhinoceros has two little bird friends – the Indian courser and the African oxpecker These two birds largely have an insect diet and feed on leeches and other insects which bother the monster. Then there are the little egrets, who billet themselves on large animals, such as the bison and the Hippopotamus and rid them of Ox-warbles, botflies and other insect pests The tsetse fly, which causes sleeping sickness in men as well as cattle is also kept in check by some other birds.

Birds of Prey

Birds are also very helpful in keeping down the population of rats and other vermin The rats are more sinning than sinned against. According to estimate of the Indian Pesticide Association, rats damage foodgrains worth about Rs 750 million per year in our country Every year 10 to 50 per cent of the entire rice crop is lost through the ravages of this rodent.

Rodents also destroy currency, clothes and even electric wiring. And worst of all, it is the carrier of plague The rock-rats depredations are well known: it feeds mainly on seeds and flowers and causes immense damage to tiny saplings. The rock-rat has been primarily responsible for hampering afforestation in the Aravalli hills.

Moreover, rats breed very fast and a single adult pair can produce several thousand little ones within a year In the absence of any effective Rodent Pest Control, the owls, kestrels and hawks constitute very important checks on the rodent population On an average, a single owl eats two rats a day A British study undertaken some years ago reveals that owls take on an average 10,000 rodents per sq km in one year.

The Arctic owls are the sworn enemies of the lemmings These little rodents of the vole family breed to such an extent that every few years they are forced to migrate from their over-populated areas in search of food. As they move across the country, eating food-crops on their way, the Arctic owls swoop down on the migratory hordes and eat them up Thus the Arctic owl performs an useful function.

Owls are also very useful to clover-growers Owls devour field mice, which attack the humble bees' nests in search of bee-grubs. Clover is pollinated only by the humble bees and without humble bees, there cannot be any clover seed Thus clover cannot b egrown without the assistance of owls.

Besides killing rats, owls also devour snakes. The long-legged Secretary Bird from Africa performs a useful service by eating poisonous snakes. This bird takes its name from the crest of feathers at the back of its head, which look not unlike quill pens stuck behind the ears

Scavengers of the Sky

Condors, vultures and black kites act as efficient scavengers of the animal world. They feed on carrion-dead birds and beasts and thus perform a very useful function in the rural countryside, where there is no sanitation. The digestive system of these birds kills even the most virulent germs. Nature has endowed them with heads, which are almost free of plumage and thus these scavenger birds are not fouled by the carrion they eat

The Hyenas of the feathered world as the vultures are known, detect the carcasses on which they feed by sight rather than by scent These carrion-feeders descend on the carcasses in hordes and eat everything, leaving behind only the bones These carrion-birds' capacities for eating dead flesh are well known; a group of the white-backed Bengal vultures can devour the flesh of a dead elephant in a single day.

A Spanish veterinarian, Dr F S Irigoyan has set up many "Vulture Restaurants" in Navarre Province in Spain, where carcasses are provided to vultures. This has been done in order to save the declining vulture population in that country

The adjutant storks, marabou storks and crows eat all kinds of refuse from the garbage heaps in villages and towns They also eat dead rats, snakes and lizards Then there are the sea-gulls, who scavenge the sea-coasts for offal left by the receding tides They also pick up

edibles that may be floating on the sea

Birds as Pollinating Agents

Besides being efficient scavengers and useful checks on pests, birds also act as pollinating agents The little humming birds help in the pollination of vanilla orchids and certain red flowers. Birds help many seeds to travel The terns often build their nests on the flattered tops of giant Pisonia trees. The Pisonia fruit is covered with a sticky substance, which sticks to the birds' plumage whenever they alight on them. When the terns migrate, they carry the seeds to other places to form new plantations.

A similar function is performed by the wading-birds. The seeds of water plants are carried from place to place in a piece of mud sticking to this bird's foot It is interesting to learn that a ball of earth taken from the foot of a partridge and kept unbroken for three years produced 80 plants when watered regularly

Birds also carry seeds inside their bodies Charles Darwin had once written to a friend 'a seed has germinated after twentyone and a half hours in an owl's stomach This would carry it God knowns how many miles' Bright coloured berries, such as hips, haws, yews and hollies are eagerly sought by many birds; they eat and digest the pulpy covering to the seeds, while the latter pass unharmed through their digestive systems Thus seeds may travel many miles before they are dropped by the birds to form new plantations in distant places.

In order to ensure our own survival, we must protect our avifauna from trigger-happy hunters The use of the camera has immensely increased our opportunity for enjoying and studying birdlife It is high time we realise that there is much more satisfaction in shooting birds with a camera than with a gun. □

Beedi Workers

(*Contd. from page* 34)

The old grave-yard which has been now occupied by the beedi workers at Dr Natesan Road must be cleared of the beedi workers, and the Government must take adequate measures to rehabilitate them, while preserving the sanctity of the grave yard

The analysis of their indebtedness clearly shows that the beedi workers are also the victims of money-lenders and therefore it is suggested that co-operative societies that can be formed in their areas, must be multipurpose ones. The societies must provide a minimum amount of Loan to them Further, the workers must be educated to avoid unproductive expenditure. The workers must be advised to develop the saving habit The rate of savings is evidently low Publicity for the National Savings Schemes must be done amongst the workers

Most of the workers have reported that they disliked beedi making and therefore it is necessary to see that atleast their sons and daughters get into some other jobs

As most of the family members of the beedi workers are unhealthy free medical check-ups and assistance should be extended to them both by official and voluntary agencies

Lastly, it is suggested that just as barbers and washermen have been declared backward by Government, same privilege can also be extended to this economically and socially weaker section of the society. □

Railways Rolling Stock Programme

The Railways have been allotted Rs 5308 million for their works, machinery and rolling stock Programme for 1977-78.

This amount includes Rs 28 million to meet the working capital for manufacture of Rolling stock for export Rs 120 million for investment in State Road Transport Undertakings, Rs 188 million for the Metropolitan Transport Projects and Rs 10 million for investment in the Indian Railway Construction Company Ltd.

In the Annual Plan for 1977-78, the share of new lines and restoration of dismentled lines is Rs 235,8 million. Of this Rs 216,8 million are earmarked for the 16 project-oriented line and Rs 19 million for 10 developmental lines. The allocation for electrification projects is of the order of Rs 190 million.

Problems of the Rural Poor

"Rural Labour in India" Problems and Policy Perspectives : *Edited by S.M. Pandey. Sri Ram Centre for Industrial Relations and Human Resources : New Delhi-5*; *Pages* 300; *Price Rs.* 45

IT IS SAID that a Seniore Economist when questi ond about the unique property of Economists remarked that if all the Economists were joined end to end they would still be pointing in all directions ! If proof of this was needed—one had only to browse through the present volume which was the outcome of a Seminar on rural labour organised by the Sri Ram Centre at Ludhiana in January, 1976 The Seminar was designed to generate knowledge about the problems of rural labour including evaluation of various measures taken by the Government to ameliorate the conditions of the rural poor Four crucial themes covered in the Seminar relate to (i) Employment and Work aspects, (ii) Income, Indebtedness and Consumption Pattern, (iii) Agrarian relations.organisations and problems of special groups, and (iv) Special Schemes for the rural poor. Some twenty-one papers contributed by agricultural economists and social scientists provide a generous measure of knowledge even if it contained well recognised and conflicting empirical evidence

It is neither feasible nor necessary to examine the many complex issues discussed at the Seminar most of which have policy relevance It is this aspect, however, that holds the readers' interest and distinguishes the present Seminar from similar other efforts under more academic auspices. The Reporteurs Notes and Discussion summaries presented sessions-wise at the end of the volume help to pinpoint the more important issues. The Seminar has provided yet another opportunity for debate on the impact of new technology on rural employment; some fresh rounds of ammunition to the already sizeable volley of fire that has been directed at the green revolution The burden of argument with varying emphasis however is that increased growth of farm output is accompanied by declining labour input, decreasing labour cost and share in output with inconsequential impact on employment. However, as summed up by the discussion leader such development is only to be expected in the context of increasing productivity of labour. But even this finding is contravened by the evidence of other contributors who have pleaded that employment particularly of the hired category has grown with the new technology.

Books

Experience in regions like Rajasthan and U.P would suggest extension of the new technology to increase both income and employment which have complementary relations and not competitive as some would have us believe

The use of input-output analysis also points to a similar conclusion, that is, increased direct and total employment and employment per unit value of output. The employment policy prescription is that if we can keep out labour saving farm mechanisation, increased productivity (not of higher labour intensity) would enable larger employment. But then labour intensity and productivity are themselves products of new technology as has been pointed out by other contributors. All this adds up, no doubt, to the overall beneficial impact on employment and incomes through adoption of new technology.

The theme income, indebtedness and consumption pattern has also attracted five papers including one by the Editor. The macro level evidence presented in the papers substantiate the well-known feature of rising money wages of agricultural workers Real wages have gone up only in Punjab and Kerala where higher level of development and better organisation of labour have contributed to this phenomenon. The comparitively better position of agricultural labourers as against small farmers, the differential growth of average income and expenditure per household, the decline in rural indebtedness are some of the other observations made by the participants The analysis however fails adequately to bring out the specific impact of the special schemes to improve the rural poor. On the contrary we are treated to a general comment as the need for designing an appropriate technology and institutional system for the small farmers and landless labourers. What this technology or optimum mix up technology, should be is rarely spelled out and few concrete suggestions if any, have been offered for implementation. To an extent the data drawn from secondary sources like N S S. Farm Management Studies etc with their known differences may have inhibited such efforts

In conclusion we may best refer to an observation made by one of the Sectional Chairman that no major significant resolutions on the issue of impact of technology had come and opinion was also divided on the need for continuance or otherwise of the special programmes for agricultural labourers. But then, was it not the prerogative of the Economist to point in all directions?

K.S.V. Sanjeeva Rao

(*Contd. from page* 28)

have an adverse impact on the price level in the short run. They argue that this might cancel the other beneficial effects. The Jha Committee should examine the validity of this apprehension. In any case, if the Government continues to remain vigilant on the price front, the VAT will not disturb the price mechanism There is another argument forwarded against the adoption of VAT. Critics observe that for a small trade or firm, it is not advantageous. This is one of the many limitations of VAT. Second limitation is that it does not lend itself easily to exemptions of individual products and services. It has been the experience that all countries which have switched on to VAT have had to face transitional problems If introduced in our country, we cannot avoid transitional problems There is one system of corporate taxation which gives such an effective spur to companies to maximise their profits, productivity and investments as the VAT There is no logical and economic reason a to why we should not try it on an experimental basis □

New Dimensions in Cooperation

Co-operation and the Dynamics of Change *Edited by P.V Chinchankar and M V Namjoshi, Published by Somaiya Publications Pvt. Ltd, Bombay, First published* 1977; *Pages* 468, *Price Rs.* 90 00

THIS BOOK contains as many as 17 contributions out of which 6 relate to the cooperative development in the U S A, Japan, Yugoslavia, Israel, Sweden and Africa A highly stimulating piece of work the contents of the book lend credence to themselves very easily coming as they do from experts in the field

While bringing out the relevance of different branches of social theory for the analysis of cooperatives, the book throws up the basic ideas that are useful in evaluating the role of cooperatives in various countries A synoptic view of co-operation and change is provided in the total approach that has been adopted in the book The discussion on the new dimension in co-operation in developing countries clearly brings out the existence of this phenomenon

M V Namjoshi points out that there is considerable unanimity on the fact that under competitive conditions, the cooperatives would tend to act in the same manner as private enterprise, their sole aim being to equate average cost with average revenue and to maximise their surplus "Under such conditions, the cooperatives would hardly help to promote equitable distribution or to reduce prices. This is how the cooperatives would operate under the conditions of free enterprise, the condition assumed by Pantaleoni, Richard Philips and E Domar" Namjoshi, therefore, seems to believe that under the socialist and communist system, cooperatives can play an invaluable role, both as an enterprise and an association, in accelerating the process of social transformation and this view finds support in the approaches of Prof Lange and Rezso Nyers

On the issue of the Indian cooperative experience, it is said that it provides a new line with which other developing countries may feel inclined to experiment There is the continuing importance to linking economic planning and cooperative movement and this has been possible through identification of areas to which the cooperative movement is most suitable

P V Chinchankar observes that in a mixed economy system, the progress, achievements and potential of cooperatives are relatively greater than under other social systems which tend to either extreme Citing Israel as a good case, he further remarks that the Israeli system has combined cooperative development with State efforts to promote the process of social and economic change." Under this system, the cooperative movement is not engaged in transforming the existing economy but in creating a new economy and society The cooperative movement in Israel had started not in the sphere of consumers' cooperation as in Europe but in the sphere of production. This, in turn, has encouraged the promotion of workers' cooperatives which in combination with trade unions and political parties have provided strength to the movement "

Navin Chandra Joshi

Agricultural Development

Poverty, Agriculture and Economic Growth *by B M Bhatia, Vikas Publishing House Pvt Ltd New Delhi, Pages X* + 260, *Price Rs* 50

FOR OVER a decade now our economists have been exerting themselves to identify the causes of Indian poverty in the context of the low economic growth amidst our agricultural development policies and programmes The author has devoted long years on the vital questions of famines, food policy, social development etc. he has also been indefatigably advancing his view points as a detached scholar all along The book is a collection of a revised version of his articles contributed to the *Statesman* (December 1975 to June 1976).

A discussion of growth strategy is followed by sketches of the broad issues of world agriculture wherein both Soviet and Chinese experience in agricultural development has been clearly stated Many valuable insights have been supplied about the reorganisation of Japanese and U S agricultural development in relation to their adaptations under Indian conditions. The treatment of domestic agriculture covers the main thrust of the strategy, problems facing land reforms the use of technology, irrigation and credit problems including cooperative credit and issues of agricultural taxation The major issues of our food problems have been analysed in relation to demography, imports, distribution, procurement and price policies. The coverage is comprehensive and the discussions also are very lucid and sincerely couched At many places the author has brought to bear on the problems his natural flair for elucidation avoiding jargon and highbrowism

The author has covered areas of public policy that are of great concern for governmental authorities Criticism has not been spared on policies of the fixation of agricultural prices, production and procurement, an area of his special competence The presentation of the various aspects has been done obviously to educate public opinion and the perusal of the book is, therefore, rewarding to those who desire to participate in a national discussion.

Development Notes

Scientific Instruments' Export Picks Up

Indian scientific instruments industry has made its presence in foreign markets like the Soviet Union, United Kingdom, Indonesia, Burma, Sri Lanka, Afghanistan, Kenya and Kuwait. Goods worth Rs 75 lakh were exported during 1975-76 as against Rs 55 lakh in 1974-75

The industry comprising 500 medium and small units is manufacturing high precision instruments such as microscopes and volumetric glassware. Ambala is the biggest centre of scientific instruments industry in the private sector The industry has an annual turnover of Rs. 4 crore

Besides manufacturing scientific instruments for educational institutions, research laboratories, manufacturing factories and different types of control rooms, the industry manufactures various types of sophisticated precision instruments

While enforcing standardisation the scientific instruments industry keeps pace with the latest developments in modern technology to meet growing demand both at home and abroad The volume of export is increasing annually and some manufacturers have received contract orders from more foreign buyers

HIL's Pesticides Plant

Hindustan Insecticides Limited, a public sector undertaking, has decided to undertake production of a number of sophisticated pesticides, demand for which was so far being met through imports

The plant to manufacture dicofol, with a 25,000 tonne capacity per year, was expected to be commissioned by the end of the current calendar year. The plant has been designed by the HIL engineers and is being put up with 100 per cent indigenous equipment. Manufacturing process for dicofol was developed by the Indian Agricultural Research Institute.

As a result of continuous research, laboratory know-how has been developed at HIL on a number of very important intermediates required for various pesticides Some of the important ones are anisole, naphthol, chloro-N-methyl acatamide and dimethylthiophosphoric acid

Know-how has been developed and perfected on very important organophosphorous pesticide dimethoate which is now under scale up study Besides, a process has been developed for purifying the black sulphuric acid to technical grade sulphuric acid The process is currently under study

Punjab Plan For Leather Development

Punjab has finalised a Rs 43 lakh plan to develop leather industry in the state In spite of its large "cattle wealth" Punjab has to procure from Tamil Nadu and other parts of the country, half-tanned leather worth about Rs. 5 crore every year to satisfy the requirements of its sport goods, footwear and other leather-based industries.

Ironically Punjab gets back in refined form the same hides and skins which are exported in raw form to Tamil Nadu and other states. As there are no adequate arrangements in Punjab for tanning hides and skins, the state industries department has finalised half a dozen schemes in the new Rs 43 lakh plan.

Under the plan, the state proposes to increase the number of flaying centres from 4 to 10 It will also provide Rs. 5 60 lakh for 3 tanning centres to be located at Banga, Malerkotla and Kotkapura, where improved method of "bag tanning" had been introduced on an experimental basis last year

The industries department has also approved a scheme to set up a light leather development centre at Amritsar for which Rs. 6 70 lakh have been sanctioned The centre will specialise in preparing light leather for garments, and other light goods like gloves, etc. This centre is expected to start production in 6 months time.

New Industrial Projects For Assam

Three industrial projects in Assam have been cleared by the Assam Investment Board recently out of the six considered so far. They are: the Jute Mill at Dalgaon, Bus-Body Building Unit under the Assam State Transport Corporation and a River Vessel Building Unit at Gauhati under the Inland Water Transport Department.

The detailed project report of Dalgaon Jute Mill with an annual capacity of 12,500 m.t. and investment of Rs. 716 lakh has already been prepared and the capital goods application has been submitted to the Centre for issue of import licence for the import of plant and machinery.

The Assam State Transport Corporation proposes to set up a bus-body building unit with a capacity of 200 bus bodies per year at a total cost of Rs. 60 lakh At present the Corporation is getting the bus bodies made in Calcutta and Gauhati through private contractors, who take a long time to complete the job The Corporation now plans to fabricate bus-bodies in two rows in the assembly line with premanufactured and fabricated components in advance to help quick assembly.

The Inland Water Transport Department of the Assam Government has 74 river vessels with a total capacity of about 4,200 tonnes All these vessels were built through private contractors at Gauhati in course of the last seven years However, now the department proposes to set up a river vessel construction unit in Gauhati

Ramganga Project Generates Additional Power

Ramganga Irrigation-cum-Power Project in Uttar Pradesh has commenced generating an additional 66,000 Kilowatt of power after the commissioning of its third hydro-generating set, manufactured and supplied by the Bhopal Unit of the Bharat Heavy Electricals Limited With this, the total contribution by BHEL-Bhopal to UP's hydro-power generating capacity has risen to 5,37,000 KW.

The Ramganaga Power Station has three generating sets of 66,000 KW each The earlier two sets also supplied by BHEL-Bhopal, were commissioned in 1975 and 1976

The Power House is situated on a rock-fill dam across the river Ramganga at Kalagarh, about 100 Kms from Moradabad in U.P Besides the generating units, BHEL has supplied, butterfly valves, generator transformer, control panels and other connected auxiliaries as well as the 132/33 KV out door switchyard equipment for this Power House

New Voltage Regulator Developed

An engineer of the Central Coalfields working at Singrauli colliery in Madhya Pradesh, has modified and developed a new voltage regulator entirely with indigenous resources.

A voltage regulator is vital to keeping the battery trim in any vehicle, much more so in heavy earth-moving machines like dumpers and dozers, which cost more than a million rupees each. The need for developing a new regulator arose when due to a defect in imported voltage regulators the dumpers had to be changed frequently adding heavily to the maintenance costs There are 53 dumpers in Singrauli coalfield

The new regulator has 30 machine hours more efficiency per month per dumper and will result in saving Rs. 400 per machine per change

As against the price of Rs. 600, for the imported regulator the indigenous regulator costs only Rs 200

Gujarat Launches Big Fertiliser Project

The 'Bhoomi Pujan' for the Rs 270 crore fertiliser complex being set up at Chavaj, about five km. from Broach in Gujarat has been performed.

The project, one of the five major fertiliser projects expected to be commissioned during the Fifth Plan period, will produce 1,350 tonnes of ammonia and 1,800 tonnes of urea per day.

M/s. Linde of West Germany will collaborate for the ammonia plant and M/s. Snam Progetti of Italy for the urea plant. The Union government has already cleared the import of several items of machinery, equipment and bulk materials.

The unit plans to sell surplus ammonia of about 1 30 lakh tonnes a year to ammonia-based industries after meeting the needs for urea production The surplus aunmonia will help promote several new industries The fertiliser complex will directly employ about 600 but many more would find jobs indirectly.

The plant will need about 1,000 tonnes of fuel oil and 1,600 tonnes of coal per day

Of the estimated cost of Rs. 270 crore, the foreign exchange component will be about Rs. 83 crore The complex was expected to be ready by December, 1979.

EDITORIAL

Planning Commission is Reconstituted

YOJANA Bhavan has come alive, again. Occasional holidays and brief periods of siesta have not been quite unknown in the history of our planning. Recently, even the talk of bidding goodbye to planning was heard in certain circles. The doubts and rumours have been at last laid to rest by the Government. It has reconstituted the Planning Commission with Dr D T. Lakdawala, Director of the Department of Economics, Bombay University, as the new Deputy Chairman and Dr Raj Krishna of the Delhi School of Economics as one of the members

In choosing these two distinguished economists, who have been known for their frank criticism of our planning policies, the Government have in no uncertain terms declared their intention to uphold the impartial character of the Commission. This will certainly enhance its stature and credibility especially in its dealing with State Governments By retaining Mr B. Sivaraman as a member and by elevating Mr. V.G Rajadhyaksha, presently Chief Consultant in the Planning Commission to the status of a full member, the Government have taken care to provide the minimum of continuity essential in the change-over

The Prime Minister has always been the Chairman of the Planning Commission and the Finance Minister a member. The presence also of the Defence Minister and the Home Minister in the reconstituted Commission will ensure in full measure the political realism and backing to the deliberations of the Commission and comprehensive coordination of plan formulations

Our Five Year Plans, we should not forget, do not have the sanction of law. The Planning Commission is essentially an advisory body and our planning is at best indicative. It puts before the Government for its consideration rational and carefully worked out choices, financial resources projections and the institutional and social prerequisites of growth, leaving a wide scope for the Government to choose and adapt, keeping in view the aspirations of the people.

Though the Planning Commission will continue to be an advisory body and the Government not essentially bound by all their recommendations, perhaps with the participation of the Prime Minister and the three senior Cabinet Ministers in the deliberations and decision making, it may be possible that in future there will be less chances of the Government facing the embarrassment of not being able to implement the recommendations.

The Planning Commission has undoubtedly done a lot in the past in bringing some amount of national concensus in the aims and objectives of planning However, there is no gainsaying the fact that much remains to be done The defects in the planning exercises and implementation procedures had resulted in wide disparity between the financial resource projections and mobilisation, between employment planning and the actual generation of employment and between the promises and the performance on the whole It cannot be denied that achievements in terms of production in many sectors particularly mass consumption goods, have been disappointing in relation to the vast needs of the country. More serious attention has to be given to the needs of the common man, especially employment and minimum needs.

There is a great need for reinforcing the research resources of the Planning Commission, so as to enable it to arrive at more rational estimates and less fluctuating projections. Side by side with this one cannot but emphasise the need to devise an effective machinery for the implementation of the programmes. □

A Plan for India's Economic Development

SUMMARY

The Finance Minister Shri H.M. Patel has released for public comments a national development plan called the People's Plan II prepared by the Indian Rennaissance Institute, a society founded by the late Shri M.N. Roy. The society had prepared People's Plan I in 1944.

The Readers may find in the Summary of the Plan II below, a totally different orientation with regard to priorities in such areas as employment, agriculture and small industries.

Comments on this Plan will be welcome.

According to the People's Plan-II, planning in India during the coming twenty years or so, should have the following as basic objectives:–

- (i) That the minimum primary consumption requirements of India's growing population should be met,
- (ii) That the productive involvement of the masses in the development of economy should be ensured by generating adequate employment opportunities,
- (iii) That economic growth on which the above two objectives are directly dependent should simultaneously ensure distributive justice, and
- (iv) That the poverty, prevailing among 40 per cent of the Indian population should be eliminated

The above objectives give a plan framework, the fundamental considerations of which are : agricultural output has to be raised rapidly and its tendency to fluctuate severely checked. A thorough going programme of land water management and agro-ecological reform must be the main instrument. Much of the work can be done by labour intensive methods with massive participation of the rural poor Secondly, the pattern of land distribution and land cultivation prevailing must be subjected to a rational reform. Consolidation and viable grouping of such holdings, coupled with stronger implementation of ceiling laws and proper utilisation of community lands represents the major tasks. Thirdly, the drive toward literacy needs to be based on development of area organisations of the rural poor, and leadership development within such organisations Fourthly, there should be a serious attempt to tackle the problem of regularising the channels of trade in essential commodities and their supply to poor households at adequately subsidised prices Fifthly, there is a need to develop a viable small/household industrial sector. Sixthly, attempts should be made to prevent the social waste implicit in the growing number of educated unemployment Programmes both for reducing the production of unemployables and for the organising of socio-developmental activities in which educated unemployed can validly participate are essential. Seventhly, while adequate emphasis has been placed on population control and on effective methods for spreading family limitation practices, particularly among the weaker section of the society

In this context the investment priorities of the People's Plan II are as follows .-

- (i) Since India's development performance both in terms of per capita product and the growth rate of employment will depend predominantly on what happens in the agricultural sector, the pattern of investment allocation in the People's Plan should be governed above everything else, by the need for providing an adequate 'input-infrastructure - institutional' base for a sufficiently rapid rise in (a) the incomes of the agricultural sector, and (b) rural employment opportunities. The People's Plan aims at a comprehensive reconstruction of the rural economy through the development of agriculture, agro-based industries and cottage/household industries. Building up of necessary infrastructural facilities (both physical and social) also is of equal importance.
- (ii) Since the supplies of primary consumption goods have been lagging behind their effective demand during the past two decades, economic growth has not generated the required improvements in the standard of living of the masses. Therefore, sectors engaged in producing goods of primary needs (agricultural as well as non-agricultural) should receive priority attention in the matter of investment allocations
- (iii) Since improvements in the general welfare significantly depend on services like health education and other community development services including those to the underprivileged and the rural masses, outlays on these services/sectors, should be stepped up substantially Apart from satisfying the known socio-political requirements, this order of investment priorities would directly enhance employment potentials because of the low capital output ratio in this sector.

The tasks identified above have a natural and integral relationship with the kind of growth needed for poverty elimination First, there must be a rapid growth and techno-organisational progress in the sectors on which the poor depend for employment: agriculture, animal husbandry, forestry, construction and public works, village crafts and small industry, small services units and minor transport. All other sectors must be treated for the time being as important only to the extent they provide necessary inputs and support services to these new priority sectors. Secondly, there must be a rapid expansion in the

Source : Fifth Five Year Plan—p. 110 for 1978-79 figures.

output of basic wage-goods industries, simultaneously followed by a deliberate attempt to curb the growth of non-essential consumption goods industries. Capital goods and intermediates goods sectors should be allowed to grow only to the minimum unavoidable extent on the basis of consolidation of inter-sectoral balances. Thirdly there must be a rapid extension of social service activities—family planning, child care, education, community organisation and health directed especially at poor communities. Fourthly, there should be an intensive attempt to improve the availability of drinking water, sanitation and housing levels of poor communities and slum areas While, in the immediate future, resources and sectoral priorities may not permit rapid progress towards permanent solution of housing and community services problem, interim measure of a semi-permanent low-outlay type-will have to be intensively pursued.

A growth strategy with the priorities outlined above and coupled with intensive attention to the tasks of planning mentioned earlier will serve not only for a vigorous action on the poverty problem but also will serve to accelerate growth. This belief is based on three fundamental factors. First, the new seotoral priorities will serve to weigh in favour of new investments towards high incremental output-capital ratio sectors and short-gestation projects. This will not be done indiscriminately, but will follow naturally from the sectoral priorities adopted. Secondly, by allowing for rapid expansion of basic wage goods output (industrial as well as agricultural) the new strategy will break the imbalance which has been responsible for continued stagnation along with inflation in the Indian economy. Thirdly, by rationally restricting fresh outlays on capital goods and heavy infrastructure, the new development style will release resources for more meaningful growth promoting activities, particularly those using social services as their main activating input.

A Twenty-year Developmental Perspective

Within the framework outlined above, the Peoples Plan tries to arrive at (a) a developmental perspective for the coming 20 years starting from 1978-79 and (b) a ten-year indicative plan for the period 1978-79—1988-89.

The resource generation assumptions made by the Peoples Plan are summarised in Table 1.

With investible resources amounting to 19 24 per cent of GDP in 1978-79, the Fifth Five Year Plan proposes a growth rate of 5.65 per cent. This involves an implicit incremental capital output ratio of 3.41:1. With a different pattern of sectoral emphasis and bias towards low-investment-cost technologies, it should be possible to hold the incremental capital output ratio down to 3.21:1 for the first 5-year period. This will allow a growth rate of 6.0% per annum. For the next three quinquenniums, capital-output ratio may be allowed to rise successively to 3.41:1, 3.6:1, and 3 8:1 respectively, the rise reflecting the gradual shift towards emphasis on higer capital-intensity sectors and more capital-intensive technical options. The growth rates of GDP for the 4 quinquenniums are thus 6 0%, 6.16%, 6 24% and 6.38% annually. This represents a slow but steady acceleration of the pace of growth as the resource-generation position improves. The results of the process are summarised in Tables 2 and 3. They indicate that the economy will grow more State-sector-oriented, that domestic savings will grow rapidly and the economy become relatively (though not absolutely) less dependent on net imports financed by foreign capital inflow. This type of action will allow the mobilisation of resources without resorting to inflationary measures

TABLE 2

Population

For purposes of Peoples Plan, population in 1978–79 is estimated at 634 millions Taking 1983–84 as the date at which birth and death rates will be compatible with long run population stability, the Plan has derived the target figures as summarised in Table 4.

Primary Needs Target : Food and Clothing

Given the figures for disposable income and population the primary needs fulfillment levels of supplies of some leading consumption items are estimated in Table 5 below. The per head physical consumption norms are those suggested in the report of the National Commission on Agriculture (Part III) The income elasticity relationships used are from F.A. Mehta, (The second India series—Economy)

Primary Needs : Health

The basic needs targets for health services are estimated as follows Health Department's population-based norms are used to estimate personnel requirements For quantum of medical expenses needed to cover the bottom 40 per cent of the population, the World Health Organisation norm of Rs. 15 per capita/year is adopted It is also assumed that this will be roughly 30 per cent of Total health services expenditure private and public

TABLE 4

Population Trend and Population Targets During 1976-2001 (Figures in Millions)

	Population as per present trend (by Medium 1 Estimate	Population Target Levels	Policy Gap

5. Expenditure on Anti-Poverty Health Service million Rs.		n.a.	5007.60	n.a.	Rs. 15/- per capita
6. Total Health Service expenditure	Rs. million	1883.81	16692.00	786.08	not applicable

Source: Fifth Five Year Plan, Health and Educational Programmes:Annual Report of the Ministry of Health and Family Planning (1974–75). The 1978–79 actuals have been estimated on the basis of planned additions to health personnel added to 1973–74 figures.

Primary Needs : Education

An essentially similar procedure is followed for estimating basic needs in education. Population-based norms of the Education Department are used to estimate numbers of primary schools/adult education centres and secondary schools A norm of Rs. 18/- per capita per year is adopted as minimum educational expenditure needs per year is adpoted as minimum educational expenditure needs for members of bottom 40 per cent of the population. The outlay on poor people's education is set at 40 per cent of total educational outlays

Primary Needs : Housing

The basic target in the housing sector is to provide the bottom 40 per cent of the population with minimum habitation standards by 1998–99 This standard involves 1 housing unit of minimum satisfactory condition per standard household of 5. This gives a target of 41.73 million housing units by 1998–99 This is the stock target

At present there are around 37 85 million housing units occupied by the bottom 40 per cent of the population. Around 80 per cent of this housing is critically substandard. Thus fully meeting the bottom 40 per cent of the population's housing minimum needs will involve by 1998–99, the following expenditure

Primary Needs : Phasing

Evidently proper 'phasing' will be necessary in meeting primary needs targets by 1998-99. As far as consumption goods are concerned, the Plan adopts the targets of attaining upto 1988–89, growth rates which (if projected to 1998–99) will reach the table 5 figures. It is also clear that the three targets concerning education (qualitative target), health and housing programme are difficult of simultaneous attainment. Therefore, it is felt that (as far as the first two targets are concerned) the first decade should achieve one-third of the needed increase and the second decade two- thirds of the needed increase. As far as the housing programme is concerned the 4 quinquenniums should involve expenditure of 0 1, 0.2, 0.3 and 0 4 per cent of the total estimated expenditure. Thus, our primary needs perspective is (a) meeting of lower estimate consumption needs by 1988–89 and fully meeting basic consumption goods supply target by 1998–99, (b) coverage and personnel norms of educational and health services fully by 1988–89 and qualitative expenditure targets by 1998–99 and (c) coverage of 3/10 of the minimum housing programme by 1988–89 and of the rest 7/10 by 1998–99 This seems to be, prima facie, the best that can be achieved by 1998–99

Sectoral Growth Patterns

By 1998–99, the per capita income will rise from its 1978–79 level of Rs 1387.10 to nearly Rs. 3506.00 This rise of 152 76 per cent in per capita income will, of itself generate a number of alterations in the sectoral composition of output. On the basis of a balanced structural pattern, the following would be the over-all structural change between 1978–79 and 1998–99.

TABLE 7

Education : Basic Needs Targets

		Actual 78-79	Need 98-99	Increase (%)	Norm

Plan Perspective : A Comparison

As compared to the existing perspective (table 10) (see next page) the People's Plan perspective has a greater emphasis on (a) construction, (b) transport and (c) agriculture and relatively lower emphasis on (a) electricity, etc. (b) manufactures and (c) services Thus, the relative high growth areas of the Peoples Plan are (a) social services, (b) agriculture, (c) small industry and (d) housing and; the relative low growth areas are (a) administration, trade and commerce, (b) large-scale industry. The much greater emphasise on rural public works, construction and transport are already evident Due to this changed emphasis, the People's Plan perspective expects relatively a better performance in terms of aggregate growth The performance is relatively impressive in terms of per capita income, since its rate of targetted population growth, 15 67 per cent, is much lower than the officially planned rate of growth which is 19 03 per cent, over 1978–79 to 1988–89 Thus, in the existing planning per capita income rises by 47 98 per cent while in People's Plan it increases by 55 98 per cent.

TABLE 10

A Comparison of Peoples Plan Perspective with Fifth Plan Perspective

Sector	Officially Planned Increase (%)	People's Plan Projected Increase (%)
1. Agriculture	48.16	57.40
2 Manufactures	104 00	96.05
3. Electricity etc	132.02	91.98
4 Construction	109.84	167.04
5. Transport	76 71	97.94
6. Services	101.05	96.09
7. GDP	76 14	80.43

The Employment Perspective

The new job demand in the non-agricultural sectors has been estimated by dividing the output increments by the Central Statistical Organisation (CSO), figures for jobs per Rs 1 million of new output. An over all reduction of 20 per cent has also been applied in order to take account of productivity increase between 1978–79 and 1998–99 Thus, the estimates yielded a figure of 165 32 million new jobs that would be created over the next 20 years in the non-agricultural sector. On the basis of the population projections presented in Table 4 and on the basis of the specific assumptions of a 95 per cent male participation and 45 per cent female participation rate in 1998–99, the potential work force is expected to rise from 199 21 million in 1978–79 to 288 29 million in 1998–99, a rise of 89 09 million Beyond this, a backlog of about 14 million of open unemployed existing in 1978-79 is to be covered' so that by 1998–99 a total of 103.08 new jobs are required in the non-agricultural sectors, merely to keep the situation as it is The net excess of jobs created over jobs required turns to be 62 24 millions. By 1998–99, the agricultural work force will be 91 11 million, as against 153.35 million in 1978–79. At the same time, output in the agricultural sector will rise from Rs. 371068 million to Rs. 730757 million involving an increase in per worker product in agriculture from Rs. 2419 75 per year to Rs. 8020 60 per year. It is expected that this change will more than suffice to eliminate unemployment and underemployment in the agricultural sector

A Ten Year Plan For People's Prosperity

Assuming the aggregate growth perspective to be attainable and considering the upper limit of aggregate public outlay thus being established, an attempt has been made to formulate an indicative 10 year plan for the period 1978–79 – 1988-89 In doing so, the sector-wise amounts of total investments are first divided on the basis of mobilisable resources within each sector and second, resources to be transferred to that sector Adding such transfer needs together for the economy as a whole (excluding the administration sector), the amount of resources which needs to be mobilised to make possible the planned programme of sectoral investments, are arrived at. The total public investment consists of these amounts and the finance raised by the Government enterprises in each sector The total public outlays are calculated by adding the necessary amounts of public non-developmental outlays in each sector. The total public outlays are then divided among 'programme sectors' of the Plan. These sectors are different from investment sectors and include both consumption and investment components.

The impact of the Ten Year Plan is, thus, developed along the following dimensions: (a) the sectoral growth pattern is worked out in greater detail and growth targets of a number of critical subsectors are indicated; (b) employment generation figures for all major sectors are, thus, computed based on sectoral increments. The excess of the labour force increment over employment generation (in non- agricultural sector) is treated as the net increase of work force in the agricultural sector, (c) the employment pattern is then treated with the output pattern (both for beginning and end-plan years) and the rise in per worker productivity in agriculture is treated as a 'proxy variable' for reduction in agricultural under-employment (d) the per capita income growth increase and its relationship with sectoral per worker productivity pattern is examined and (e) finally the Plan's implication on the poverty situation is derived.

Resource Generation Potentials

Table 11 (see next page) indicates the estimated resources to be raised by the Government.

Public Investments

The logic underlying the plan investment pattern (Table 12) is explained below·

1 Agriculture is an activity best developed under private initiative However, it will require massive investment support Similar is the situation for small industry. Thus, these two sectors show relatively high ratios of private and government (transfer) investments.
2 Large industry is a sector where both private and public sector investments should evenly collaborate However, since the Plan does not propose too-fast an increment of this sector, the degree of 'transfer' is low
3 Electricity is a sector in which there is little private investment possibility. Self-generated government investments are also likely to be insufficient. This calls for a high rate of transfer.

4.	The construction and services (less administration) sectors display fairly equal participation by private and public investment. But, due to high planned rates of growth in both sectors considerable transfer is required.

TABLE 11

Resource Mobilisation Limits During Ten Year Plan Period (1978-79—1988-89) (minimum estimates)

1.	Gross Domestic Product (Plan Annual Average)	: Rs 1035198 millions.
2.	Gross National Product (Plan Annual Average)	: Rs. 1181368 millions.
3	Ratio of Direct Taxes to GNP in 1978-79	: 3.42 per cent.
4.	Direct Taxes (Plan Annual Average)	: Rs. 40402 79 millions.
5.	TOTAL DIRECT TAXES	: Rs. 404028 millions.
6	Ratio of Indirect Taxes to GNP in 1978-79	: 13. 32 per cent.
7.	Indirect Taxes (Plan Annual Average)	: Rs. 157358 21 millions.
8.	TOTAL INDIRECT TAXES	: Rs. 1573582.10 millions
9.	TOTAL TAX REVENUES (5+8)	· Rs. 1977610 millions.
10.	Savings by State Enterprises as a ratio to GNP 1978-79	: Rs 4 26 per cent.
11	Planned rise during People's Plan	. Rs. 20 per cent.
12.	Rate of State Enterprise Savings	. Rs. 5.11 per cent.
13.	Government Enterprise Savings (Plan Annual Average)	. Rs. 60391.53 millions
14.	ESTIMATED TOTAL SURPLUS OF GOVERNMENT ENTERPRISES	Rs 603915.32 millions
15	Foreign capital inflows (Plan Annual Average)	. Rs. 12547 11 millions
16.	ESTIMATED TOTAL FOREIGN CAPITAL INFLOWS	. Rs 125471.10 millions
17.	TOTAL MOBILISABLE RESOURCES WITHOUT DOMESTIC BORROWINGS (5)+(8)+(14)+(16)	: Rs. 2163472.4 millions
18.	Net borrowings, maximum	: Rs. 30 per cent of (17) above
19	MAXIMUM PUBLIC OUTLAYS WITHOUT DEFICIT FINANCE	· Rs 2812514 millions.

Note : The above 'minimum estimates' have been generated by assuming (1) that rates of direct and indirect taxes *will not rise* above the rates they are planned to reach (according to official plans) by 1978-79; (2) that the proportion of surpluses of public enterprises to Gross National Product will rise to 20 per cent above its level in 1978-79; (3) that foreign capital inflows will be as shown in the macroeconomic balance (Chapter Four: Table 4.2) and (4) that domestic borrowings will be limited to not more than 30 per cent of the total resources raised by the first three methods. These assumptions guarantee that the resource-raising by the visualised can actually take place These are, thus, the minimum estimated of the maximum resources that may be raised by the government, without resorting to deficit financing

Considering the process of investment-financing, it is estimated that out of a total investment outlay of Rs. 1944724 million (less administrative investments), the private sector's contribution will be of Rs.853824 millions while the public sector raises Rs. 1090900 millions of which Rs. 367830 million is financed from enterprise surpluses; Rs. 597599 millions out of budgetary surpluses and; Rs. 125471 millions out of external funds Comparing this figure of Rs. 1090900 millions of investment outlays with the figure of Rs. 1735686 millions of total permissible public outlays of both investment and non-investment types, total non-investment outlays comes to about Rs 644786 millions In order that external dependence may be reduced, this outlay is cut down to Rs. 540000 millions. This allows Rs. 827980 millions to be financed out of budgetary surpluses and reduces the degree of external financing of total investment outlays. There is, thus, a total plan outlay of Rs. 1630900 millions of which Rs. 1090900 is investment and Rs. 540000 millions is non-investment development outlay

The programmewise allocations of the total outlays are presented in Table 13 (see next page). By comparing these allocations with the Fifth Plan allocations it can be seen that the People's Plan II lays greater emphasis on (a) agriculture, (b) irrigation and flood control, (c) housing, community facilities, etc. (d) education and (e) health, nutrition and family planning Sharp reduction occurs in (f) industry (large), (g) transport/communications and (h) power and energy. Some of the apparent reduction is, however, a result of non-conformity in sector definitions In table 5.4 these comparative data are presented with appropriate changes in order to secure full comparability. It is clear from Table 14 that the share of agriculture in plan allocations is raised from 11.82 to 15.28 per cent, the share of irrigation and flood control from 8.76 to 13 26 per cent; of education from 3.27 to 7 47 per cent; and of social and community services from 12 13 to 23.88 per cent As against this, the share of industry is reduced sharply from 25.96 to 15.20 per cent and of power and energy from 18.56 to 10.26 per cent. The share of transport and communication all drops, but less sharply, from 17 51 to 14.21 per cent In other words, from an industry-power-transport-oriented plan 390 the xis-

(h) Allocations after considering other outlays

ting type, the emphasis has shifted to an agriculture-education-social services-oriented plan The People's Plan lays stress on housing, community facilities on the one hand and on health-nutrition-family planning on the other.

Growth and Employment Generation

The above mentioned shifts in the investment pattern are primarily intended to generate a greater volume of employment per unit of additional income generated In particular the aim is to generate a much faster increase in employment opportunities for *unskilled* labour (both urban and rural) so that employment generation may have the easing impact on the poverty situation.

The quantum of new jobs created (according to the People's Plan pattern) is 46 943 millions over the decade in the non-agricultural sectors. Applying parallel methods of anlysis to the Fifth Plan growth perspective, new job generation in non-agricultural sectors drops to 43 357 millions In the same period, the labour force (calculated on population basis) rises from 199 21 millions to 244 81 millions, registering a rise of 45 60 millions Thus, while the People's Plan allows for a net absorption of 1 34 millions into the non-agricultural sector, relieving the under employment pressure in agriculture the Fifth Plan variant leads to net surplus of job-seekers over jobs in the non-agricultural sector of 2 24 millions, who must be absorbed into agriculture, thus increasing the pressure of under-employment and unemployment.

As far as unskilled labour is concerned, the growth pattern of the People's Plan helps in three ways First, the increment of unskilled labour in the People's Plan is smaller (3 13 million) due to the expanded skill building and educational programmes. Secondly, the direct generation of unskilled labour demand through People's Plan (40 787 millions) is 3 039 millions higher than that of the Fifth Plan perspective (37 738 millions). Finally, the People's Plan includes (over and above natural employment increments to be expected through growth), much larger programmes of direct supplementary employment creation. It can also be seen that while in the Fifth Plan perspective 120 7 millions of new dependents will have to be supported by 44.46 millions of new jobs, in the People's Plan 99 5 millions of new dependents will have to be supported by 52 05 millions of new jobs. The

ırce · Fifth Five Year Plan, p 52 [1] As per Official Sector Definitions.

endents incremental ratio improves, s, from 2 67: 1 to about 1 81 1

›wth and People's Prosperity

n aggregative terms, the People's n expects to achieve a rise in ›ss Domestic Product by 80.04 cent over ten years As popula- ı rises during the same period by ›ut 15.85 per cent, a rise in capita GDP of 55.41 per cent anticipated This will take per ıta income from Rs 1387.13 Rs. 2198 86 in 1975-76 prices the mean time, the per capita ›me of the bottom 40 per cent he population is expected to rise n Rs 520 to Rs. 963, a rise of ut 100.62 per cent. This higher : of increase in the case of bottom per cent is attained mainly ›ugh, (a) the impact of the plan the demand for unskilled labour, the massive outlays on services :ifically included to benefit the ker sections like education, health housing, (c) the direct and in- ct contribution from the primary sumptions fulfillment programme (d) the over all bias of the Plan avour of the bottom 40 per cent. :ulating like-wise for the Fifth ı variant fields a per capita in- ıe for the poor group of only 785 45. Thus, there is a gain in the People's Plan of over Rs 164 per head in the final average annual income of the bottom 40 per cent of the population.

Within the above specified over all structure of the 10-year Plan, there has to be significant variations in the pattern of allocations over time. The reason behind this is that (in any process of shift from one strategy of growth to another) there must be an intervening 'transition phase' in which the imbalances of the previous strategy are corrected. Only after this phase, can growth along the new strategy begin in earnest. The Peoples Plan II, therefore, visualises a 3-year 'transition phase plan' covering the first three years (1978-79—1980-81) of the ten year plan outlined above.

The investment and growth pattern envisaged during the transition plan is presented in Table 15 below.

Thus, while out of a total increment in gross domestic product of Rs. 619910 million over the 10-year period, about 27 09 per cent is accounted for in the transitions phase about 24.92 per cent of investments being accounted for during the same period.

The investment allocation for the three year plan (1978-79—1980-81) have thus been attempted with a view to ensure a smooth transition from a heavy industry-capital goods oriented Fifth Five Year Plan to an agriculture-services-oriented Peoples Plan, envisaged in the 10 year development plan. The broad allocations indicated in the Table 5 adhere to new scheme of priorities evolved. for the 10 year development

The significant features of the Peoples Plan II (in comparison to the Fifth Five Year Plan) are:

Firstly, the economy becomes relatively less rapidly industrialised while modernising faster in terms of social services, public utilities, housing standards and agrarian economic conditions. Secondly, industrialisation is relatively more small-industry-oriented and consequently more capable of dispersal and positive interaction with the rural environment Thirdly, there are small but distinct gains in terms of slower population growth, faster economic growth and a faster rise of per capital incomes. Fourthly, the State sector becomes increasingly involved with provision of services and public utilities and has relatively less to do with industrial growth. Fifthly, transport and construction receive greater emphasis, while the emphasis on power generation is reduced. Sixthly, the process of growth becomes somewhat more consumption-oriented and somewhat less capital accumulation oriented. The major gains in consumption are, however, in terms of basic necessities and social welfare services. Finally, because of the labour intensive nature of the growth process, generation of more employment opportunities is rendered possible, when compared to the official variant Each of these features testify to a better balance between growth and social justice requirements in the People's Plan perspective. In conclusion the strategy and approach suggested by Peoples Plan II will generate and sustain that kind of economic development which will help in raising the real standard of living of the more of Indian people ☐

New Thinking on Planning

V. K. NARASIMHAN

THERE CAN BE no two opinions that, after a quarter century of planning, there is compelling need for fresh thinking and evolving of new approaches and strategies if the war against mass poverty in India is to be won before the end of the century. The advent of the new Janata Government, pledged to the pursuit of a Gandhian programme, is perhaps an appropriate occasion for such an exercise. The Prime Minister, Mr. Morarji Desai, disclosed the other day at a press conference that the Government was engaged in efforts to give a new orientation to the country's economic policies. Almost simultaneously the Finance Minister, Mr. H.M. Patel, released for public discussion an elaborate "People's Plan the Second" prepared by the Indian Renaissance Institute, which was set up by the late, Mr. M.N. Roy over 30 years ago.

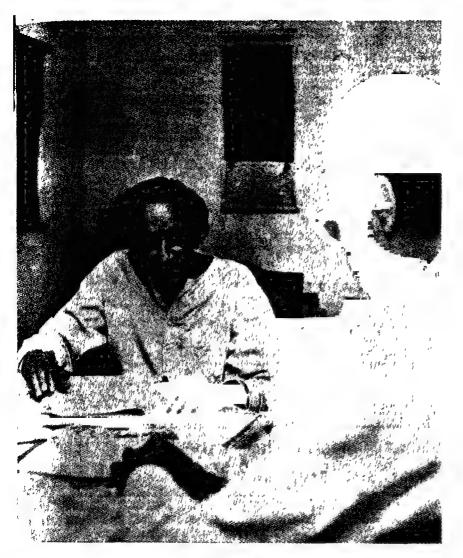
Admittedly, the Renaissance Institute's plan does not represent official thinking. It offers an alternative approach to planning based upon the experience and the failures of the five Five Year Plans that have been implemented since 1950–51. The Second People's Plan recognises the achievements of the Five Year Plans in diversifying the economy and in creating an infrastructure for development by providing several essential requisites like power, transport, technical education and the like. Enormous investment has gone into the establishment of a wide range of industries, largely in the public sector, and in the development of irrigation and hydro-electric resources. Where the plans have failed is in failing to meet the basic needs of the mass of the population, in generating adequate employment for the growing population and in narrowing the disparities in the incomes of the population. That these failures are directly related to the pattern of investment undertaken in the plans as well as to gross lapses in implementation of plan projects is clear beyond doubt. There has been too much stress on capital intensive and heavy industries and too little attention to increased production of goods of mass consumption. There has been very little cost consciousness in operating public sector projects. The output-capital ratio has been steadily declining from one plan to another, which means that more and more capital is invested to produce proportionately less and less goods. An index of the rake's progeess in this sphere is provided by the official figures which show that the output-capital ratio, which worked out to 47 per cent in First Plan period, has declined to as low as 19 per cent in the Fourth Plan. This means that an investment of Rs. 100, which resulted in an output of Rs. 47 during 1951–56, yielded in 1969-74 an output of only Rs. 19. No wonder that inflation has become endemic and the rate of growth of economy in real terms is miserably low.

The Renaissance Institute's plan seeks to remedy this situation by changes in the pattern of investment as well as in the methods of implementing the plan. It envisages a 20-year intensive plan indicating the sectoral pattern of outlays and the sources for the mobilisation of resources. The emphasis in plan outlays is shifted from heavy industries and large-scale manufacturing to agriculture, small-scale industries and social services for the benefit of the rural population. The avowed objective of this shift is to raise productivity in agriculture, increase rural employment and improve the incomes of the most depressed sections of the rural population—the marginal farmers and the landless labourers.

It is not necessary here to go into the elaborate statistical exercises that have been carried out by the economists of the Renaissance Institute in support of their plan. Only a detailed study of the figures and the assumptions on which they are based can reveal how realistic and practicable the estimates are. Moreover in all planning, as past experience has shown, resources mobilisation is only a small part of the planning process. Much more important is the way the money is spent and the continual effort to operate projects on an efficient and remunerative basis. If our earlier plans have proved unrewarding, it is because in many cases heavily capitalised projects like steel plants or engineering units were operated far below capacity. It will be even more difficult to achieve high levels of productivity in agriculture, especially when we have to deal with millions of small farmers operating under various handicaps, besides the vagaries of the monsoon.

What appears to be the weakest aspect of the Renaissance Institute's plan is that it does not correct what has been the basic weakness of all the earlier plans, namely, the failure to plan from below. The Institute's emphasis on basic needs of the population takes too narrow a view of the rural population's requirements. Surely there are other consumption goods which are as important as the eight items which figure in its plan targets: foodgrains, sugar, gur, vanaspati, tea, coffee, tobacco cotton cloth. Other items which ought to be included are: vegetables, edible oils, milk, kerosene and non-cereals like pulses. The plan targets for basic commodities should include these items and some more like paper, which is closely linked to expansion of education.

The most important task facing the Government in evolving a new plan strategy is to relate the resources available at the rural level to the needs of the rural population, not as determined by planners in Delhi, but by the local population themselves. The drawing up of plans from the district level will mark a revolutionary change in our approach to planning and will make popular participation in the planning process meaningful and fruitful. Macroplanning on a national scale is unavoidable, but it is microplanning at the district and village level that will produce worthwhile results and improve the living conditions of the masses. Only then will Indian planning receive the Gandhian orientation which is desired. □

Shri Narasimhan is a journalist


KRIPALANI SPEAKS TO YOJANA

"I have confined my observations to the approach of the plan, which, I believe, will not solve the basic and pressing economic problems of the country. These are, the agonising poverty and the colossal unemployment of the mass of our population living in the villages. If these problems are not satisfactorily solved, all our dreams of a new social order based on democracy, non-exploitation and equality will fail to materialise"

This was what Acharya Kripalani observed 21 years ago, speaking in Lok Sabha on Second Five Year plan. The same concern for the rural population, the same emphasis on employment echoed when he spoke in an exclusive interview to Editor Yojana.

The elder statesman has analysed various problems confronting our country with a perspective characteristically Gandhian, practical, realistic and forthright.

Yojana: Do you think that in the changed circumstances the economic and social priorities in planning also should change ?

J.B.: The problem in India is how to utilise the immense human resources that are available in the country. Unless this problem is solved we cannot make much advance. Even health, sanitation, education and other social and cultural programmes will have little effect unless the question of employment is solved. This can, however, be solved to a great extent through decentralised industry. This does not mean that there should be no centrailised, mechanised, big industry but as Gandhiji said all the primary requirements of the villagers must be provided within the village or within a group of villages. Centralised and mechanised industry was recommended to save human labour which in the long run may cost more than decentralised production.

"Village Requirements Must be Provided within the Village or within a Group of Villages"

When Gandhiji talked of village and cottage industries he was thinking in terms of what was possible under the conditions prevalent in India in those days, but he had no objection to electricity being used and supplied to every village so that the drudgery of hard work could be avoided and production increased These days every big machine has standardised parts They are manufactured in different departments of a big factory, from where they are collected and put together to produce a big machine But these parts instead of being produced in different departments of a big factory could be produced in the homes of the villages with the use of electric power and lathe This kind of decentralisation is preferred even by the capitalists, as in this type of industry there is no fear of strikes and lockouts Also this method of production is cheaper

Something of this sort is happening even today in the Punjab. Small parts of scooters, sewing machines etc are being produced there in this fashion However, this kind of decentalised industry with the use of electricity must supplement the craft work which is carried on through manual labour

Yojana: JP has said that spare time of the students should be properly utilised Now that the schools and colliges are closed for the summer vacation, what can the students do during the vacation ? What is your advice?

JB: They can go to villages and try to educate the villagers in many different ways They can show them how to keep their houses and surroundings clean. They should try to impart to the rural folk knowledge of the three R's. They can help them to build roads. They can help them to dig small canals. Anyone who goes to the village from a town can always find some scope for doing some useful work depending on the circumstances of the rural area one goes to. The students if they are really well-informed can also tell them about how to make best use of the village Panchayats.

Yojana: What is your advice on students taking part in politics?

JB: You must define politics Gandhiji was engaged periodically in the Satyagraha movements. These were organised at long intervals. During those intervals he carried on constructive work Was he then doing political work or could it be said that he had left it. Advancement of the country involved not only political work but also some social and economic work. All these are interconnected Agitational politics is different. I feel tha it is not possible for the student to carry on their studies and also participat in agitational politics unless they are prepare to leave their studies for sometime. Other wise, every work of constructive nature i the social or economic field must be consi dered as their participation in politics.

Yojana: Don't you think adult education should ge better attention ?

JB: It is very important. Many of the problem of our country could easily be solved wit the spread of ecucation. Students shoul take the responsibility for educating th adults Not only during the vacations, bu also during their spare time. It should b a continuing process, not sporadic.

Yojana: You wanted top priority to be given to emp loyment What will the old and disable persons do? Do you feel the Governmen should have some old age-pension schem for these people?

JB: It is good to have old age pension, if th Government can afford it But I think th primary duty of the Government is to se that all able-bodied persons get remunerativ work In a vast country like India, I think the Government cannot, as it is constituted at present, undertake to maintain all old and disabled people However, efforts could be made to provide some work which could suit their physical capacities

Yojana: Government has been showing great interest in developing a sense of unity among people belonging to different regions of the country and achieve emotional integration between them and among them. After two or three decades of conscientious effort in this direction, we find that regional and linguistic disparities still continue and the proper kind of emotional integration and better understanding has not been truly achieved Do you have any suggestions to make in this regard?

JB: Again it is a question of employment. Why do the people from the South come to North? Because they have employment opportunities in the North and, therefore, they come and settle down, which is a good process in integration More employment opportunities should be created in the South so that people from the North would certainly go to South, settle down there and will imbibe their language and culture Integration cannot be an isolated programme. It should be related to life and living. □

"Advancement of the Country involves not only Political Work, but also Social and Economic Work"

"The Primary duty of the Government is to see that All Able-bodied Persons get Remunerative Work"

Rural development plays an important role in the overall economic development of the country since four-fifths of our people live in villages. Developing a few enclaves of prosperity surrounded by vast areas of poverty, under-nourishment and disease without the benefits of development being widely spread out to cover the whole country of various strata of society, would amount to having little dent in the development of the rural sector.

Planning for Rural Development

S.C. TRIPATHI

DURING THE PAST two and half decades, some progress has been made in rural development. But the position is still far from satisfactory. More than 40 per cent of the people mostly in rural areas are still below the poverty line In 1971, according to estimates of the Bhagwati Committee on Unemployment, 85 to 88 per cent of the total unemployed and under-employed persons were in the rural areas. Even the Fifth Five Year Plan Document says "there is no doubt that living conditions have improved everywhere even in the most backward districts. Yet large numbers continue to remain poor" The existence of poverty is incompatible with the vision of an advanced, prosperous, democratic, egalitarian and a society based on the principles of social justice implied in the concept of a socialist pattern of development. In fact, it holds a potential threat to the unity, integrity and independence of the country" It is in view of these facts that elimination of poverty has been given the highest priority in the Fifth Five Year Plan

The two main causes of poverty in India are under-development and inequality, which are extensively prevalent in rural India Some studies made recently indicate that in the wake of Green Revolution, inequalities in the countryside have further increased during the past few years.

The removal of poverty and development of the rural areas in keeping with the Directive Principles of the Indian Constitution call for a multi-pronged action-oriented series of programme In the strategy for planned rural uplift, the development of agriculture implying an increase in productivity and distributive justice, in relation to the ownership of land and allied industries like fishery, forestry and animal husbandry have undoubtedly a prominent place. All the Five Year Plans including the current one have given fairly high priority to these sectors in terms of financial allocations. But there is still vast scope for further investment in these sectors Land reforms have to be made more effective by bridging the gap between contemplation and implementation. Yet. at the same time, it must be appreciated that keeping in view the existing surplus agricultural labour which is estimated to be about one fourth of the total working force with immense potential for further growth and the limited cultivable land the uplift of India's countryside and its masses calls for a balanced integrated growth, a proper balance and integration between agriculture, on the one hand and teritiary and secondary industries on the other. Unless such inter—and intra-linkages are properly worked out for a cluster of growth centres in such regions of each State, and implemented with the necessary drive and tempo the problem of tackling poverty is likely to take a very long time The problems of rural poverty, unemployment and under-employment are likely to grow further without such a multi-pronged effort on a national scale. The continuous inflow of labour in search of employment opportunities in cities and towns seems to be essentially an overflow of rural poverty, unemployment and under-employment. Unless job-opportunities are created in villages and semi-urban areas, it is very difficult to check further influx to cities

Shri Tripathi is Joint Director, Planning Commission.

Fluctuating Harvests

It is a matter of deep concern that in our country where 80 per cent of the population is engaged directly or indirectly in agriculture the country has had spells of good and bad harvests and is still not self-sufficient in food. One of the basic tasks of the planning in India has been consistently to transform the subsistence agriculture in the country into a viable economy capable of generating surplus The production of foodgrains before the on-set of planning era in the country was 35 million tonnes in the year 1949-50. It reached about 67 million tonnes during 1955-56 the end of first Five Year Plan, 82 million tonnes by the end of the Second Five Year Plan in 1960-61 and 89 million tonnes by 1964-65.

High Yielding Seeds

However our country launched a new and bold programme in 1966-67, called the "High Yielding Varieties Programme for foodgrains". Due to the impact of this high yielding varieties programme the foodgrains production reached 95 million tonnes in 1967-68 Since then the upward trend in foodgrains production has been consistently maintained with the production reaching a peak 108 4 million tonnes in 1970-71

The experience of high yielding varieties programme led to crystalisation of the agricultural strategy for the Fifth Five Year Plan. The two paramount objectibes of the Fifth Five Year Plan are firstly, to generate an overall growth rate of4 7 per cent per annum in agricultural production and 5 per cent in allied sectors such as livestock, fisheries and forestry. The second objective is to make a significant contribution towards substantially improving the economic condition of the 40 per cent of the total population of our country mostly living below the poverty line through greater participation of small and marginal farmers and agricultural labourers in the intensive agricultural programmes and also providing subsidiary occupations to them particularly in the slack season These measures are intended to impart a greater degree of stability to agricultural production in rainfed areas, which in turn would act as a defence against

the sharp decelaration in agricultural production in such areas. For such integrated rural development programmes financial base is being created for the rural poor through setting up Farmers Service Societies and regional rural banks in such areas of the country where commercial banks have not found their operations profitable

Dependence on Imports

Despite the step-up in output of foodgrains and oilseeds since 1960, we have not been able to totally do away with imports With the growth in population, the generation of surplus in agriculture is offset and consequently there is continuing need to further step up the output. The technology of high yielding varieties programme, the introduction of rice and wheat crops in non-traditional tracts, the extension of groundnut cultivation in irrigated areas and also the measures taken to stablise agricultural production in rainfed areas have resulted in the stabilisation of agricultural output. The foodgrains imports have registered a decline from 10 0 million tonnes in 1966 to about 2 0 million tonnes in 1971, 3 6 million tonnes in 1973 and 4 8 million tonnes in 1974 With the achievement of an all time record foodgrains production of about 121 million tonnes during 1975-76 and the continuance of a similar tempo in agricultural production in the current year, the country may be said to have reached a stage when it will not require any further imports of foodgrains

It is equally necessary to accelerate the process of decentralisation of industrial growth We should evolve a short as well as long term programme of developing and grooming growth centres, away from the present centres of industrial concentration in all the States. It is well-nigh impossible to think of industrialisation of each and every village. On the basis of the available infrastructural facilities like transport and communications, power, skilled labour, entrepreneurship, banking facilities, raw materials, etc, we should draw out a list of potential growth centres in each and every State and try to develop a few of them at a time spread over a few years In these centres, the State Industrial Development Corporation could develop industrial areas, estates close to the villages in which industrial sites/sheds could be sold or leased out to the prospective entrepreneurs. It is in realisation of the coordinated agro-industrial development programmes that the Fifth Five Year Plan included a bold programme of integrated Rural Development.

The place of cottage and small industries in the village is next to that of agriculture. It is estimated that more than 20 million people are engaged in the village and cottage industries in the country. For relieving pressure on land, we have of necessity to take recourse to programmes capable of generating millions of non-farm jobs in viable small scale rural industries based on local raw materials, skills and demand. The rising purchasing power in the rural areas and the encouraging progress in rural electrification present both a challenge and an opportunity to the fostering of subsidiary as well as small scale industries in the rural areas It is recognised that all the villages cannot be developed simultaneously, nor, all are suited for industrial development. Yet there are a large number of big villages which could promote linkages with urban areas These centres of growth or focal points can act as levers of industrial spread in remote rural and backward areas. Apart from evolving a functional relationship between agriculture and rural industries, there is need for securing a coordinated growth of agriculture and rural industries, power and communications etc In the Fifth Plan, in addition to the continuation of the existing 49 rural Industrial Projects under Centrally sponsored schemes, it has been decided to start 62 new projects mostly in selected backward areas and these will be coordinated with the programme for the development of village industries

Need for Industrial Cooperatives

The factors inhibiting the progress of small industries including industrial cooperatives have largely been the paucity of raw materials, industrial extension serivces, and credit and marketing facilities. The policy measures to overcome these problems include a progressive increase in the allocations of imported and indigenous raw materials which are in short supply, the control on production and prices of yarn required by weavers, reservation of additional items for exclusive development in small sectors, provision of concessional finance and investment and transport subsidies for promotion of small industries in the backward rural areas where the artisans engaged in traditional rural industries are living below the poverty line. The principal objectives of the programme for development of small industries in the Fifth Plan are to facilitate the attainment of some of the major tasks for the removal of poverty and inequality in consumption standards of the rural workers and artisans, through creation of large scale opportunities for fuller and additional productive employment and improvement of their skills

A remarkable headway has been made in providing research findings for use by farmers in their fields as emerging from coordinated research Projects of the Indian Council of Agriculture Research, the research complexes of agricultural universities and by special Central institutions set up for dry land farming research. It is in rural industrial and in subsidiary activities that we have yet to go a long way in determining the technological factors most suitable to maximising and diversifying production The paramount need to developing rural industrial and agricultural allied activities, such as livestock breeding, fisheries, dairying and forestry on a more methodical and scientific basis can hardly be over emphasised Given the necessary determination and organisation, India, may, in course of time, not only be in a position to feed its growing population but also, become capable of exporting agricultural com modities both unprocessed and processed to other countries of the world. □

Harnessing Sunshine for Rural Development

N. D. BATRA

The modern sophisticated Indian technology based on non-renewable energy reserves, like oil, non-coking coal and natural gas etc. cannot run beyond a few decades. Hence there is an urgent need for economic development based on replenishable resources in the country.

In many momentous ways, solar energy seems the perfect answer to our energy problems It is completely benign to the environment It falls in everyone's backyard and it is everlastingly abundant. In just one year the radiation reaching the surface of the Indian soil exceeds the total amount of fossil energy that will ever be extracted in India.

According to the Fuel Policy Committee Report (1974) the consumption of commercial and non-commercial energy for the whole of India for the years 1960–61, 1965–66 and 1970–71 is tabulated below –

It will be seen from the table that seven-eighth of the energy consumed under columns 5, 6 and 7 was used in villages Besides the villages had a significant share in the consumption of kerosene and diesel (col. 3) which are mainly used for lighting and irrigation pumps, respectively India's population which is about 550 million is likely to be 800 million by the end of the present century. With this increase in population, the energy requirements of Indian villages by the turn of the century will have grown nearly twice the energy consumed in rural areas in 1970

Fortunately, India is well placed in having a very important natural advantage i.e. perpetual sunshine in the most parts of the country For ten months of the year, and for six to eight hours a day, most parts of India receive fairly high intensity, uniform sunshine. This renewable, non-polluting energy source is so pervasive and diffusive that it can be harnessed most economically on small scale to meet the needs of individual families and/or group of villages. It is through this replenishable source that the dream of Mahatma Gandhi, can be realised Solar energy gives the rural India a chance to build themselves up as autonomous republic with the loosening of urban control over their inputs.

There are about 4 5 lakh villages in the country with a population of less than 1,000 each where the energy requirement is low and which are thinly populated and away from the industrial centres. Solar energy could be an attractive alternative in these villages. It can meet small localised needs and can be put to a number of applications in rural areas. Some of the promising solar energy applications of rural interest are outlined below

Solar cookers which did not evoke much response in the early fifties may find acceptance with the rural womenfolk who have no inhibition in cooking outdoors. The development of simple stove-type solar cooker, using mud and glass panes will improve the prospects of solar cooking in rural areas. Though the technology is simple, yet practically all types of food can be cooked with this solar oven. Besides some of the advantages are· (1) its performance is not affected by wind; (2) there are no chances of dust falling in the cooking pot, (3) the food remains warm for hours if kept inside the oven even after sunset; and (4) it does not require frequent adjustment towards the sun. However, the success of any solar cooker will depend on whether it is within the reach of the common rural folk

The solar water pump which will have capacity between two and five horse power, is being developed principally for use in rural areas. It will have no recurring power expenses, and should last more than 10 years. The prohibitive cost of the initial unit—Rs 50,000 is not as staggering as it sounds When compared to the cost of conventional generation of electricity and its transmission to remote villages, a solar water pump may become economically feasible for many parts of the country

The solar power station project hopes to develop a mini-power unit that can be used in rural India to collect solar energy and transform it into electric energy for lights, fans, TV sets, and small-scale machinery In one such unit, which is

Year	Coal (m. ton)	Oil (m. ton)	Electricity (bl. kwh)	Firewood (m. ton)	Cowdung (m. tom)	Vegetable waste (m. ton
1	2	3	4	5	6	7
1960–61	47 1	6.75	16.9	101.04	55.38	31.08
1965–66	64.2	9 94	30.6	111.82	61.28	34.41
1970–71	71.1	14.95	48.7	122.75	67 28	37.77

Source : Report of the Fuel Policy Committee 1974

now under construction, solar energy would be collected to produce steam, which would then drive a turbine to generate electricity. The mini-power plant being built now will be commissioned by the end of the current year.

Research on solar desalination plants has been confined to the laboratory so far, but the Central Salt and Marine Chemicals Research Institute, Bhavnagar, has produced a successful prototype. Experts feel that solar energy is ideally suited to converting brackish water into potable water, thus benefiting countless villages dotting the far-flung country.

Research over the last 15 years has produced three major designs for solar water heaters with capacities from 140 to 200 litres. However, since the cheapest of these coasts Rs. 3,500 the solar water heater is still too expensive for the average consumer

Simple solar heating and cooling systems (not direct-conversion devices) have been developed and some are under experimental operation in the country. The University of Roorkee is testing a heating cooling system, and a BHEL workshop in Hardwar is being heated by a solar system.

Agricultural industries stand to gain substantially from the development of a solar dryer. Agricultural produce—rice, wheat, corn, chillies, dry fruits and many other items such as tea and timber can then be hygienically and uniformally dried. Many research centres such as the Forest Research Institute, Dehra Dun, have already produced prototype solar dryers.

It is expected that some of these solar-energy devices will be fully tested and operated before the end of 1977. Solar energy scientists are understandably cautious Before they publicise any of their devices or projects, they want to be sure it has been thoroughly tested and used —not just in laboratories.

A special attraction of this year's Republic Day Parade was the presentation of a tableau of the Department of Science and Technology. The Tableau depicted for the first time, working models of solar cell and solar grain dryer which could be used with advantage even in the remotest rural areas. Besides the Tableau generated 70–80 watts of electricity to work a TV set which relayed the Republic Day proceedings and in addition provided lights in the hut shown in the tableau. It is expected that by 1980 solar power from solar cell panel may become competitive to diesel power.

In pursuance of these achievements by the Indian scientists in the field of solar energy, an International Solar Energy Congress will be held in the month of November this year at Vigyan Bhavan, New Delhi to discuss the local theme: "Sun: Mankind's Future Source of Energy".

Thus it can be inferred, and perhaps rightly too, that solar energy could be a boon for Indian villages, particularly the ones situated away from industrial centres. Pumping irrigation water, drying and processing agricultural products, producing potable water from brackish water, cooking, lighting and entertainment are some of the important fields of solar energy applications for rural areas which need to be given priority in our development efforts.

It is too early to estimate the impact solar energy will have on India's total energy requirements. However, the solar energy programme is forging ahead with support from the Government, industry and private institutions. "We are now reaching the production stage", says Dr. H.N. Sharan, solar energy expert and director of Bharat Heavy Electricals Limited (BHEL), "and it's time to get these devices out to work"

However, judging from the current status of this technology, its large-scale application in the next few years is not very likely. Yet, there is no reason why direct use of solar energy cannot be undertaken exclusively within the next 15 years. It all depends on how serious we as a nation are about using this inexhaustible resource □

Yojana Quiz

1. What is Kuro Siwo?
2. An air flight at a fixed height above sea level round the earth over the circumference passing through the poles would reveal less mileage then a flight round the equator—why?
3. What is the difference between artery and vein?
4. What is meant by
   (i) Detente
   (ii) Shuttle Diplomacy
5. What is the trophy for Asian Football?
6. With which sports and games are the following terms associated?
   (i) Dribble
   (ii) Cow
   (iii) A Half Nelson
7. With which sports and games the following places are associated?
   (i) Eden Gardens, Calcutta (ii) Chepauk Ground, Madras
   (iii) White City, England (iv) Forest Hill, USA
8. In XXI Grand Olympics in Montreal India finished with how many medals?
9. Who was the South African scholar and traveller, who visited India during 1333 A D and spent 8 years in India and has written about the reign of Mohammed bin Tughlaq?
10. In what state of India are the following most abundantly found?
    (i) Gypsum (ii) Manganese
    (iii) Chromite
11. How is the President elected in India?

Answers:

(1) Kuro Siwo (Black current or Japan current) is a warm ocean current flowing up the Asian east coast and is driven by Westerly winds towards North America. (2) Because the earth is an oblate spheroid (a ball flattened at the poles) (3) Artery is a system of branching tubes carrying blood from the heart to all parts of the body. While vein is a tube that carries blood from some parts of the body back to the heart. (4) (i) Detente: end of strained relations between two countries (ii) Shuttle Diplomacy The rapid flights from one world capital to another and back again in an effort to persuade rival parties to accept compromise formula. (5) Merdeka (6) (i) Football (ii) Rowing (iii) Wrestling (7) (i) Cricket (ii) Cricket (iii)Greyhound Racing (iv) Lawn Tennis (8) India finished with no medals. (9) Ibn Batuta (10) (i) Rajasthan (ii) Madhya Pradesh (iii) Bihar (11) The President is elected indirectly by an electoral college consisting of the elected members of the both Houses of the Parliament and the elected members of the legislative assemblies of the States

Quotation Box

We do not want to make a hurried change which is no good. We do not want to do anything for the purpose of demonstration. We want to do things in a manner to benefit the people and not for the sake of demonstration. For we do not attach any value to demonstration.

Water Hyacinth for Benefit of Man

R.R. KHAN
AND
R.C. GUPTA

WATER HYACINTH (*Eichhornia crassipes Solms*) has long been considered a serious threat to our agricultural and piscicultural operations Researchers have now found that this weed can effectively be utilized as a means of treating effluents and producing biogas, fertilizers and livestock and poultry feed

The weed, a native of Brazil, is believed to have been introduced in Bengal as early as 1888 It belongs to the family Pontederriaceae and is popularly known as *Kachuripana* in Bengal, *pisachithamara* in Andhra Pradesh, *akasathamarai* in Tamil Nadu, *kolavazha* in Kerala and *Jalkhumbhi* in North India The plant consists of a fleshy vertical stem called rhizome, which floats just beneath the water surface and is protected by shields of folded leaves It remains alive even when the adverse conditions kill the surface leaves The growth of water hyacinth is mainly by vegetative means. The growth of this weed is so prolific that it can double in number every 8-10 days in warm and nutrient-rich waters. In India, there is an estimated 6,00,000 hectare water area which is covered with water hyacinth.

The ravages caused by this problem-weed are extensive. It impedes run-off in streams and promotes backwaters and flood conditions It affects drainage of cultivated land and renders it unproductive The mat-like spread of the weed cuts-off air and sunlight from the water rendering it unproductive for fish culture It also obstructs wave action in the water and interferes with the activities of birds Spraying of larvicides and adopting other antimosquito measures become difficult in weed-infested water bodies Water hyacinth 'rafts' also hinder navigation and interfere with landing facilities for ships.

Shri Khan and Shri Gupta are with the Industrial Toxicology Research Centre, Lucknow.

Because of the extensive damage caused by it, several state governments have taken steps to destroy this weed In West Bengal, the eradication of water hyacinth has been made compulsory by legislation within notified areas. Special water hyacinth weeks are organized during which parties of workers clear infested areas and heap them up at the banks for eventual use as manure. In Assam, provisions are made in municipal and local-self government act to enforce land holders to eradicate water hyacinth. The Madras Agricultural Pests and Diseases Act, 1919 makes the destruction of the weed obligatory on the part of the owner or the occupier of the land, channel or pond. In Uttar Pradesh, the Government assists the removal of water hyacinth

Growth of Water Hyacinth in a pond

by grants for compost making.

The benefits resulting from these legislative and other regulatory measures, however, have been comparatively limited due to the laborious task of removing the weed and its quick regeneration. The attempts to use chemicals such as a copper sulphate, lead nitrate, sodium arsenite, and methosone have also been mostly unsuccessful due to the high cost of pesticides.

Pollution Control

Having failed to check the menace of this noxious weed, researchers have now unravelled the potential of the weed to control pollution. The scientists at US National Space Technology Laboratory (NSTL) have recently demonstrated some remarkably simple and economically attractive solutions to the problem of water pollution using water hyacinth.

Water hyacinth is found useful in treating effluents polluted with toxic heavy metals. In static laboratory experiments, water hyacinth rapidly absorbed gold, silver, cobalt, strontium, cadmium, nickel, lead and mercury. As much as 97 per cent of the cadmium and nickel was absorbed through the long trailing roots within 24 hours. It has been found that a hectare of weed has the potential to remove 300 gm of cadmium or nickel from about 53,000 gallons of polluted water in 24 hours. The scientists have claimed that this process would not only clean toxic effluents from factories but could even be used to concentrate and reclaim valuable metals.

The weed is also capable of absorbing phenol and phenolic substances commonly found in domestic and industrial sewage and even in drinking water. Laboratory experiments revealed that it could remove 12 mg of phenol in 24 hours, from the water in which it was grown.

Raw sewage from small communities contains on an average 35 mg per litre of nitrogen and 10 mg per litre of phosphorus. An experimental half hectare water hyacinth lagoon with a minimum sewage retention time of two weeks is found to purify to acceptable levels the daily waste of one thousand people.

This is not for the first time that the idea of utilising water hyacinth has been experimentally proved by American Scientists. In India, as early as 1969, workers at Public Health Institute, Patna have reported that water hyacinth can be utilized for the treatment of industrial wastes and septic tank effluents.

TABLE 1

Chemical Composition of Water Hyacinth (Percentage)

	Green weed	Ash	Compost (dry matter basis)	Fodder (dry matter basis)
Moisture	95.5	—	—	—
Organic Matter	3.5	—	—	—
Nitrogen	0.04	—	2.05	0.97–2.57
Phosphorous (Pentoxide)	0.06	7.0	1.1	0.36
Potassium (Oxide)	0.20	28.7	2.5	5.6
Sodium (Oxide)	—	1.8	—	3.5
Calcium (Oxide)	—	12.8	3.9	3.0–4.0
Magnesium (Oxide)	—	—	—	0.96
Chlorine	—	21.0	—	3.0–4.0
Ash	1.0	—	—	—

The weed thrives well in the digested sugar factory wastes and coagulates and removes turbidity and bad odour. In septic tanks, the weed is found to reduce the total count of coliform bacteria from 1,70,000 to 10 per 100 ml in 24 hours. This phenomenon is explained due to possible agglomeration of colloidal particles in the sewage which quickly settle in the bottom along with the bacteria.

Other Uses

The water hyacinth has also been utilized as a manure . Due to its high nitrogen and mineral content (Table 1), water hyacinth can be used as an organic fertilizer and soil conditioner. Its high moisture retention properties improve the condition of sandy soil. Water hyacinth mixed with earth, cow-dung and wood ash gives a compost in about two months time. This compost is twice as rich as town compost and four times as rich as farmyard manure. It is therefore ideal for jute and rice fields, for vegetable gardening and fruit growing.

Water hyacinth also shows considerable promise as an animal feed supplement. When used directly as a fodder, water hyacinth proves inferior to the common fodder. The weed is eaten by cattles and horses in India. It is reported that milk yield in buffaloes is enhanced by 10-15 per cent but the milk is more watery and the extracted butter lacks in consistency and flavour.

As poultry feed, the live water hyacinth is reported to have increased the yellow colouration of egg yolk. Even after several yars of feeding, no deterioration in the egg-laying capacity of the poultry was seen.

Production of Biogas

Water hyacinth can also be used to produce biogas containing 60-80 per cent methane. It is thus a promising substitute for natural gas. The research at NSTL shows that 374 litres of biogas can be produced per kilogramme of dried water hyacinth. Its fuel value is 21,000 btu per cubic meter as compared to 31,600 but per cubic meter for pure methane. It is estimated that one hectare of water hyacinth fed on sewage nutrients can yield 0.9-1.8 tonnes of dry plant meterial per day. This biomass can produce 220-440 cubic meter of methane with a fuel value of 7–14 million btu. In addition, the aludge that remains after fermentation is a useful fertilizer because it retains msst of the nitrogen, all of the phosphorus ard other minerals.

Raw Material For Plastics

Attempts have also been made to utilize water hyacinth as a raw material for paper, plastics and other commercial products but so far no industry based on water hyacinth appears to have been established. The manufacture of paper from the dried weed stem has been attempted in West Bengal. It is found that addition of jute or cotton fibres to the extent of 8-10 per cent of the weight of pulp is considered necessary as the paper prepared from water hyacinth stem alone is translucent.

Greater emphasis is now being given by the Government to the conservation of resources and recovery of essential elements from waste products. Water hyacinth which was hitherto considered a waste can be put to a variety of uses. Realising its importance, the Indian Council of Agricultural Research is shortly going to launch an All-India Coordinated Research Project at Bhubaneshwar, Orissa. Besides other things, the project will concentrate on using water hyacinth for rearing cattle, pig and goat. ☐

For centuries man has criminally destroyed the precious natural manure, the cow-dung, for burning. This has immensely affected soil fertility and food production. In the wake of the energy crisis the recent discovery of gobar gas technology will not only produce many times more energy but also leave a residue far richer manure says,

A.R. PATEL

GOBAR—
A Potential Source of Energy

RECENTLY A NEW chapter has been added in commercial application of Gobar Gas an alternative source of fuel There is sufficient evidence that the Gobar Gas technology can be applied on a mass scale for preserving "both environments and resources" and disposing of the sewege in a scientific and useful manner. In the ultimate analysis application of this technology in our rural areas will have a far-reaching effect which would help rural reconstruction. The Govar Gas as an alternate, yet cheap source of energy, has been endorsed by an International Workshop on "Bio-gas technology and utilisation" under the auspicies of Economic and Social Council for Asia and Pacific We have, therefore, to view the implications of this technology in the light of (i) our heavy dependence on oil as a source of energy for which we have meagre resources and (ii) transforming our rural life from absymal poverty to a level of reasonable standard of living

Oil has been the primary fuel used during 1975-76 and it generated the highest quantum of energy in India. According to official sources, the proportion of energy derived from oil was 30 5 per cent followed by fire-wood (26.5 per cent) Other sources of energy included coal (21 per cent), hydel and nuclear power (8 per cent), cowdung (6 per cent) and vegetable waste (8 per cent)

Now how can this energy crisis be solved? The answer lies in recycling of cowdung for the production and utilisation of bio-gas.

When the first gobar gas plant was installed by Jashbhai Patel in 1951, the significance of the event was not realised as fossil fuels were cheap, and the emphasis was on importing them into the villages Thus it was thought kerosene cookers, hurricane lamps, rural electrification and chemical fertilizers would raise the standard of living. With the high cost of rural electrification and pet-petroleum products, gobar has technology has once again come into focus The superiority of gobar gas plants in many respects over chemical fertilizer plants has also been endorsed by the United Nations Environmental Programme (UNEP).

Difficult Task

Sewere losses in transmission of electricity (18%) and extremely low load factors (1 to 14%) have led to the unfavourable economics of power distribution to the backward and rural areas Only 11 per cent of the villages with a population below 500 have been electrified despite the fact that about 60 per cent of 5,67,000 villages in our country have population below 500. Even the plans do not envisage power for about 2,80,000 villages with a total population of 141 million people (25% population) This, therefore, clearly reflects our inability to provide social amenities to rural population as also power for their various agricultural operations including energisation of irrigation wells and agro-based industrial units

In 1972-73 the total fertilizer consumption was about 3 million tonnes (2 million tonnes nitrogen). Of this 40 per cent was imported at a cost of Rs 135 crores at that time The rapidly escalating price of fertilizer and of the naphtha feed stock for fertilizer plants has made it imperative to develop Gobar gas as a source of energy.

Potential Resources

India with its large population of cattle can have no difficulty in obtaining adequate supplies of cattle dung. The Khadi and Village Industries Commission (KVIC) which has evolved a scheme to set up gobar gas plants in the country, has estimated that the fomantation of 75 per cent of the dung collected from the country's 226 million cattle (1961 livestock census) would possibly yield about 195 million MWH of energy per year (which is equivalent to about 24 billion litres of kerosene) and at the same time produce 236 million tonnes of menure. The nitrogen content of this manure would be around 2.5 million tonnes which is more than the nitrogen fertilizer capacity established in our country so far. According to the KVIC the quantity of cowdung being burnt as fuel is about 400 million tonnes However, if utilised for production of gas, the manure obtained therefrom would enable the country to increase foodgrain production considerably.

Gobar gas is obtained through the formentation of cattle dung anaerobically. The two constituents of this gas are 55 per cent mathane and 45 per cent carbon dioxide by volume. Dried cattle dung cakes burn with a lot of smoke and 11 per cent efficiency. Wood burns with less smoke and 15 to 17 per cent efficiency. The gas is combustible and has about 550 BTU of heat per cubic feet. When burnt through burners, it burns with hot blue flame (800° F to 1000° F) without odour or soot Gobar gas can be used as a fuel in kitchens for cooking, heating and lighting as well with the aid of suitably designed containers and burners which are obviously quite different from conventional ones But more important is the residual slurry which can serve as a rich source of organic manure so urgently needed in our rural areas

Shri Patel belongs to the Bank of Baroda, Bombay

for increasing agricultural production and land productivity. The manure contains about 2 per cent nitrogen as against only 0 5 per cent of it in the farm yard manure Moreover, on account of the rich humus content in this manure, the physical characteristics of the soil can be improved in respect of water holding capacity, prevention of water logging, soil aeration and the like As the manure is in finally divided form, it easily mixes with soil and thus prevents breeding of flies and mosquitoes It is free from offensive odours which are usually associated with compost manure A number of studies conducted all over the world have shown that by preparing a compost obtained by mixing the slurry released from bio-gas plants with green leaves or stalks and mixing this with small amounts of chemical fertilisers, farmers can get a highly efficient organo-mineral manure which gives excellent crops without impoverishing the soil.

Experiments at IARI have shown that the energy obtained from a family sized village model gobar gas plant producing about 100.0 cubic feet gas per day can be used for cooking, lighting, and running engines

Ideal Model

To develop "Gobar gas models" for small villages, it is necessary to have exact statistics on the human and cattle population, the daily yield of night-soil and dung, the efficiency of collection of these two inputs, the availability of water, the gas yield per unit weight of dung and night soil, the availability of other fermentable cellulogic wastes etc.

A 'Gobar gas model' for a village of 500 population with 100 houses and 250 cattle population may be hypothetically assumed to yield 597 kg of dry dung available for use (75% of the 3.2 kg dry dung per animal per day arrived at by the NCAR). This village can, therefore, be expected to generate about 3950 cft of gobar gas per day from cattle dung. Besides, if the village has latrines connected to gas plants, a further 500 cft of bio-gas would be generated. Thus, the total daily production of bio-gas in the village can be estimated at about 4450 cft According to one estimate, the actual daily energy consumption of this village is of the order of 50 kwh which is equivalent to 3333 cft of bio-gas This consumption is distributed as (i) 200 kwh for cooking, (ii) 200 kwh for energizing 10 pumpsets of 5 hp working for 5 hours per day, and (iii) 100 kwh for lighting, entertainment etc. At present the villagers obtain this energy by burning cow-dung, fire-wood coal or kerosene and by running pumpsets with diesel or petrol or electricity.

The total village production of 4450 cft of bio-gas corresponds to 667 5 kwh/day, or 244 kwh/year This energy is sufficient for 10 pumpsets at 20 kwh/day/pumpsets, 5 industries at 10 kwh/day/industry, one light in each of the houses at 0 675 kwh/day/house, energy for cooking in every house at 2 kwh/day/house, leaving a balance of 150 kwh/day for street lighting, etc In other words, bio-gas energy will meet 1 335 times the present demand of 500 khw/day and 62.5 per cent of the future demand of 1065 kwh/day, assuming a reasonable yield of 3 cft gas/lb of dry dung. In fact, it has been found that rural electrification is not going to reach 89 per cent of the villages with a population below 500. These villages, therefore, have no choice except adoption of bio-gas plants

On the basis of either a manure to dry dung weight ratio of 1.2:1 or a manure to net ratio of 0 4 lbs manure/cft of gas, the village production of organic manure would be estimated to be 0.8 tonnes per day with a nitrogen content of about 12 kg/day which would be about 295 tonnes of organic manure per year with a nitrogen content of 4 4 tonnes per year At the present level of consumption in India, 12 kg/hectare, the nitrogen output of the bio-gas plant can be used on 370 hectares which may be about 27 per cent more than the average cropped land areas of 290 hectares per village. Hence bio-gas plants may easily be able to supply to the village its fertilizer requirements at present levels of consumption. If 5 tonnes of foodgrains per tonne of nitrogen were estimated at a most conservative rate, it follows that the fertilizer produced by such plants would produce aditional 22 tonnes of foodgrains per year in the village This benefit is distinct from the other important advantages which would be had from saving in naphtha required for the production of fertilizer. In quantitative terms this saving would be approximately of the order of 2 tonnes of nephtha per village per year The village production of nitrogenous manure containing annual nitrogen yield of about 8.8 tonnes/year could also be obtained if a system of the manure-forming aludge to compost with refuse is developed.

Thus the adoption of bio-gas plants to produce fertilizer in the villages would yield extra benefits such as (i) dispersal of production units to villages, (ii) saving of capital, (iii) saving of foreign exchange, (iv) generation of more employment for less skilled workers, (v) generation of energy rather than consuming it and (vi) production of fertiliser at a source where it is consumed saving transportation

Based on this study by Prof A.K N. Reddy at the Institute of Science, Bangalore, the United Nation's Environmental Programme (UNEP) points out that 26190 bio-gas plants will produce so much fertiliser as a single 140 million coal-based plant but the bio-gas plants will cost $14 million less to build and will generate 130 times as much employment. What is more, the addedprosperity will be diffused over 26,000 villages instead of being

Large-scale coal-based Vs Bio-gas fertilizer plants

		Large scale coal based plant.	Bio-gas fertilizer plant
(i)	Annual production/unit	5,00,000 tonnes urea	590 tonnes compost.
(ii)	Annual nitrogen production	2,30,000 tonnes	8.8 tonnes
(iii)	Capital cost/unit	Rs 120 crores	Rs 4,000/-
(iv)	Foreign exchange component	Rs 50 crores	Nil
(v)	Employment/unit	1000	5
(vi)	Sales Rs. 4350/- tonnes N	Rs 100 crores	Rs 38,280
(vii)	Capital turnover ratio	1.20	1.07
(viii)	To produce 2,30,000 tonnes N		
	(a) No. of units	1	26,150
	(b) Capital cost	Rs 120 crores	Rs. 107 crores
	(c) Foreign exchange	Rs. 50 crores	Nil
	(d) Employment	1,000	1,30,750
	(e) Energy	Consumption	Generation

concentrated in a single township and since the fertilizer will be consumed where it is produced, it will eliminate the need for storage packing, and transportation.

While in the context of the present oil crisis there is every possibility that gobar gas plants can provide an alternative source of fuel and fertilizers, we should have a look at the problems challenging the expansion of the scheme and endeavour for their solutions right from the beginning.

Problems :

The mal-nutrition of the cattle has been the major constraint adversely affecting the quality as well as the quantity of dung. This can upset the viability of the gobar gas units and further it needs to be examined as to whether it would be adequate to have 4 to 5 cattleheads or 8 to 10 cattleheads per family for the purpose.

Since the gas plant's manure contains lot of water, its drying makes it lose fine physical condition along with a good amount of ammonical nitrogen which can be readily available to growing plants from the gobar manure water. Another problem faced in rural areas is that no space is available near homes where gas can be used. Methane gas cannot be transported economically to small quantities as produced in domestic gobar gas plants. Moreover, gobar gas contains about 45 per cent carbon dioxide which results in the deposition of carbon in engine/burners run with the gobar gas. Besides, cattle dung is a rich source of cellulose and hand-cellulose from which methane is obtained during digestion. Cattle dung is very slow formentor probably because it is poor in favourable nutrients which pass on to urine Thus some way to collect urine of cattle with cow dung is called for since most of the cattle in the rural hinterland are not stall-fed and there is no arrangement of modern cattle sheds under which cowdung and urine both could be collected with ease.

As the day temperature goes down the gas production falls. When the digestor temperature reaches to 10 C (50 F), the production of gas almost ceases. It is revealed that 80 cubic feet of gobar gas was produced from 150 lbs of cattledung every day when the gigester temperature was 25°C (77°F). The temperature was then kept at 28.3°C (85 F), the gass production was increased by 50 per cent (120 cubic feet per day). The production of the gas in many cases particularly in the northern States either has stopped altogether or it is too low..

Some of the farmers who have installed the plants for the efficient utilisation of farm wastes are unhappy with the performance of these plants Their expectations that these plants would provide solution to their problems of fuel and fertilizer have not been fulfilled because of operational difficulties. The maintenance and operation of the plants have become so embarassing problems to them These unforeseen problems have arisen largely due to inadequate arrangements of training, technical guidence and advisory services on their use and after-care The problem of either nil or less production of the gas could be attributed to low temperature, inadequacy of dung or incorrect mixing of inputs which include dung, water and other available farm wastes Haryana farmers have been experiencing a situation in which the plants produce abundant gas but it does not burn Often a problem of foul smell is also faced by the farmers, which because of the nearness of the plant to residence could discourage them

For lighting purposes suitable gas mentles are available in the market while for operating engines, certain modifications have to be introduced in the petrol engine to make it run on methane gas. Gobar gas lamps are reported to have been manufactured but are costly and often not available. Also some of these lamps produce an irritating noise.

Experiences

The findings of recent study of the problems and prospects of gobar gas plants conducted by the Indian Institute of Management (Ahmedabad) in Gujarat are revealing. Though restricted to one state, its findings about the economics of operations and problems in the working of the gobar gas plants are, in a broad sense, true for the entire country. The most frequently reported technical problems were raising to corrosion of gas holders and pipelines owing to rust, seasonality of gas output, frequent breakdowns of the central guide pipe and bursting of the hosepipe, cracking of the digester wall, difficulty in slurry stirring in the digester, the formation of scums hindering the release of the gas, shortening the life of the gas holder, choking of the inlets and outlets of gas plants resulting in disturbances to the flow of gas, accumulation of water in the pipeline and non-availability of the optimum level of water and dung resulting in improper loading of the digester and reduced efficiency. The socio-economic problems faced were—prohibitive cost of plant and cattle requirements for the poorest section, lack of backyard space owing to the residential pattern in villages, difficulty in dung collection because cattle are grazed in open areas rather than in fenced areas, lack of water sources near the plant, difficulty in connecting latrines with the plant because of their being away from the home.

Gobar gas plants of all sizes, small or big were found to be economically viable investments but the gains were marginal and the payback period of the initial investment was very long for small plants of 60 to 100 cubic feet, particularly if the benefits were valued realistically. This focussed the attention of the financing institutions to the fact that a differential maturity period and rate of interest on bank loans should be adopted—a longer maturity period and lower interest for smaller plants. From the economic point of view, the rationale of a flat rate of subsidy on all plants is not justifiable, particularly in the case of large plants.

The organisational network to reach the results of research and development in gobar gas plants and to provide follow-up services needs to be strengthened. This need was felt since a larger percentage of farmers belonging to low socio-economic groups faced technical problems and break-down in gobar gas plants

This calls for vigorous efforts in several direction. A comprehensive approach to the whole problem is called for. An integrated model of components of this package, such as technology, services and extension and training will have to be evolved. The elements of these components interact in such a manner that a drawback/lacuna at any one point or failure could seriously undermine the role of the others.

Research and development

The solutions to a vast range of problems challenging the utility and large-scale development or expansion of gobar-gas plants in our country have to be endeavoured by the advanced scientific multi-disciplinary research institutes. A broad spectrum of the tasks for research and development which various scholars have reviewed is outlined here.

1. Nature of extention services required for popularisation of gobar gas plants.
2. Technology of the collection and preparation of various fermentable materials other than dung such as poultry wastes, agricultural cellulosic wastes
3. Optimisation of fermentation process for villages where water is scarce
4. Detailed chemical engineering design of the gobar gas plant with maintenance of optimum conditions for methane production
5. Research and development on alternative materials such as ferro-cement, treated wood/plywood, polythene, glassfibre or Jute-fibre, etc for the gas holder.
6. Development of simple gas purification methods including utilisation of carbon dioxide and hydrogen sulphide
7. Study of safety methods and design of safety procedures for plant operations as also for holding and storage of methane
8. Study of the fertilizer characteristic of the sludge obtained from the fermentation of the various inputs such as animal, human and agricultural wastes.
9. Optimisation of composting techniques
10. Studies on fermentation parameters such as rate, gas yield, gas composition etc as a function of variables such as temperature, pressure, pH, viscocity, agitation etc for various input materials
11. Studies on the nature of fermentation chemistry and microbiology with reference to the choice and growth of microorganisms for optimum methane production.
12. Development of nomograms for extension workers to give on-the-spot designs to suit locally available fermentable materials and requirements
13. Research and development on alternative linings for the digester.
14. Studies of the fertification of bio-gas fertilizer with chemical fertilizers on the physico-chemical properties of the soil and their effect on plant characters
15. Design of auxiliary equipment for safety use of bio-gas for cooking, lighting and engines.
16. Comparison of social costs and benefits of small number of large size bio-gas plants Vs a large number of small size plants with reference to economies of scale and village population.

In view of the current problems confronting the farmers, IARI has expanded its activities of research and demonstration To popularise the scheme IARI had in the month of March 1975 held agricultural fair where gobar gas plant installed at the fair attracted most of the 3000 odd farmer-visiters to seek solution to their problems Further work on acceleration of fermentation in gobar gas plants, devising gobar gas burners of more than 60 per cent efficiency, development of alternative materials and designs of gas plant to lower the costs and improve its working is being undertaken the IARI and K&VIC. The Mi try of Industrial Development also set up a committee for directi on gobar gas plant work in its aspects. Experiments are in p gress at IARI to chemically prep manure from a variety of orga wastes like animal bones, hair a wool wastes and leather wast The effect of these manures on s properties, plant growth and c production should be studied detail.

It is a matter of great interest t even the United Nations Industi Development Organisation (UNID has submitted to its Committee Voluntary Contribution (CVC) project proposal to authorise th to spend $ 2000 for engaging consultant in India to prepare a first step, a detailed technical bl print on bio-gas plants with d regard to socio-economic facto The UNIDO is also keen to ren all necessary technical assistance initiating a national level integra project in India, under the UNI for development, manufacturing, p motion and extension of bio- plants. Thus, our scientists, admi trators and planners should lose time in seeking solutions to unforeseen problems and formu ting a policy which can involve rural areas to contribute their entl siasm to make the scheme a gra success and meet the challer presented by the oil produc and exporting countries

SIDE TRACK

TO AVOID the possibility of contracting a common infection that could cause mental and physical retardation to newborn children, pregnant women should keep away from cats and not eat rare meat, two University of Victoria scientists warn.

The infection, called toxoplasmosis, is caused by a microbe commonly carried by cats and found in rare meat, which has been ignored medically in North America mainly because of a lack of information, according to Dr. K.A. Karim, an immunologist studying the disease in association with Dr. Trevor Trust, chairman of the Bacteriology and Biochemistry Department.

Karim says if a foetus is infected it will probably show signs of either brain damage, psyeho-motor retardation, epilepsy or eye and ear problems a few weeks or months after birth. Contrary to medical practice now, "pregnant women would betested for toxoplasmosis as a matter of routine in their general prenatal checkups...

"Mechelonic.. have for the first time introduced A.C. Arc Welding Transformer Sets. It is of a remote control type with automatic voltage stabiliser.

Mechelonic ensures safety which is of primary importance in all welding applications, especially when welding is carried out at a higher altitude!.

The machine is indigenously built with know-how and materials of local origin. The machine serves import substitution.

—V.K. Narayanan

The Railways have liberalised the rules for the cancellation of tickets and refund of fares from March this year

The Station Masters have been empowered to grant refund of fares on the spot, reimbursement for non-commencement of journey or discontinuance of journey for which the Railway is held responsible, and refund on partially travelled tickets deposited within 24 hours after the arrival of train.

A passenger, who has lost his ticket, will also be permitted to continue his journey in payment of 25 per cent pf the total fare.

Special attention is given to tourists, students, and others, who will be allowed to travel by any other train if their reservations are not confirmed on any particular train.

—V.K. Narayanan

Aesthetic Pulse of a Nation

HANDICRAFTS

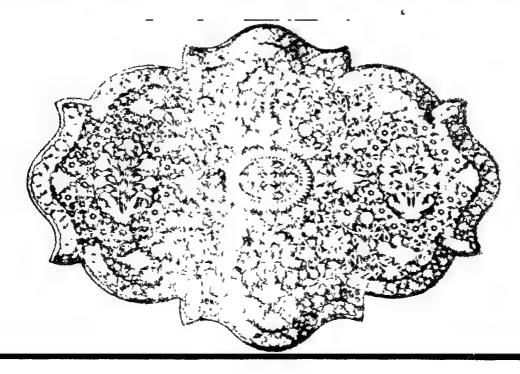
SWATANTRA

Handicrafts have played a significant role in the Indian non-factory industrial sector accounting for nearly fifteen percent of the contribution made by the unorganised industrial sector to national income. The recent trends in export of Indian handicrafts have revealed the growing popularity of reoriented handicraft items all over the world. The future of this industry depends upon the introduction of fresh designs in line with changing times.

Basketry is primarily a folk craft. It is a very important household industry in Manipur Nagaland, Arunachal Pradesh, Mizoram, and Tripura. Pic shows an intricate basket woven by Shri Laithanzama of Mizoram.

INDIAN HANDICRAFTS are as old as Indian civilisation itself. The earliest examples of Indian handicrafts date back several millenia: the ruins of Harappa and Mohenjo-Daro, the remnants of a great civilisation that straddled the Indus valley for almost 25 centuries. In the ruins were found fragments of beautifully printed textiles and pottery, uniformly baked and enticingly coloured, bronze and terracotta figurines, stealite seals, exquisitely carved and calligraphed ......a rich testimony to a tradition of artistic skills prevalent in that primeval age.

From those pre-Vedic times to the present this tradition has bloomed and wilted through the course of a changing history. But it has never died. Through aeons the soul of an aesthetic people has spoken not only in esoteric exercises of the intellect, but in every aspect of day to day existence so that the ordinary began to be cherished. Hence, utility and beauty became synonymous.

Shri Hafiz Khan has evolved many designs in marble inlay which have become very popular. He uses for his inlay work patterns, of Jasmine, rose, magnolia, chrysanthemum and marigold flowers. He generally makes table-tops, plates, boxes, trays and tiles.


Octogenerian at work. Shri Sompura is deeply erudite in the scriptures and ancient lore concerning temple sculpture. He has written more than a dozen books on the subject.

It is this long heritage of creative genius permeating the total environment that has been the springwell of inspiration for simple village craftsmen A feel for colour and form that is born more out of instinct than out of formal training; a way of life so steeped in legend and love that culture is inborn and an innate thrift and artistic impulse that sees magic in the most mundane materials...... these are the strands that coalesce to produce India's folk crafts. Vitally alive, the throbbing pulse of a people, personal as a signature and yet meaningful for their universal metaphor of beauty as a sacred spiritual trust Indian handicrafts are as varied as the people of the country. Almost all the materials produced by nature: be it grass, reed, palm leaf, wood, horn, cane or bamboo are fashioned into objects of beauty and utility by the skilled fingers of our craftsmen.

In order to safeguard the production and development of handicrfts, it is necessary that the craftsmen's skills are duly recognised and steps taken to remove their difficulties and to facilitate their functioning Thus the National Awards for Master-craftsmen was instituted by the All India Handicrafts Board in 1965. These Awards have been an annual feature since then Each award consists of Rs 2,500 in cash, a *Tamrapatra* and an *Angavastram*.

This year ten Master craftsmen were given the National Awards. With these, the number of craftsmen who have received the awards would be one hundred and ninety.

Amongst the Master craftsmen who received the Awards this year were great gurus of the classical tradition working in ivory, marble inlay, bell-metal, carpet-weaving along with rural craftsmen, who, for centuries, have used straw, grass and cane to weave intricate baskets for their personaluse. Apart from thes ten craftsmen were given Mer Certificates for their skill and craft manship in maintaining the traditio of Indian handicarfts.

Shri Prabhashankar Ognadbh Sompura hails from a family c sculptors wedded to temple archite ture. He has been responsible for th construction of 55 temples. Amon his latest creations is the constru tion of the Somanath temple a Somanath based on the ruins of th original temple. A few years ag this octogenarian, author of a doze books was awarded the Padm Shree

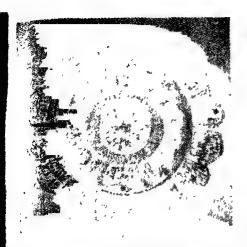
A self-taught craftsman 53 yea old Shri Lalthanzama has mad substantial contribution to cane an bamboo craft He evolves beautif designs and transfers them in simple and lovely creations in ca and bamboo which is both funciton and artistic. With rich experien spread over three decades he ha brought a new meaning and chara ter to even simple cane and bambo products

Hailing from a family of traditi nal brass and bell-metal workers Imphal, Thongam Amar Singh too to his family craft at the age twelve Apart from being an expe bell-metal craftsman, Amar Singh also good at knitting, weaving an instrumental music

Rashid Ahmed who has been give the award for Pottery is a perfe master not only in designing but all the techniques of this ancie craft. He has developed his ow colours and glazes which make h creations unique He has mad significant contributions in impr ving the techniques involved in bl art pottery.

Mohammad Sajid, a hereditor ivory carver has been in his trade fo over forty years. He was traine by his father Abdul Wajid, himse a craftsman of great repute. Saji is an acknowledged master in fir *Jali* work. He is also skilled i traditional ivory carving in Mugh style. A gifted designer himsel Sajid reveals in full his artistic attai ment in *Jali* cutting and *Parin* (bird) carving.

Forty four year old Hafiz Kha has been in the Marble inlay trad for over 30 years. The delicat time consuming work is so intrica that at times an onlooker cann admire the work with his nake eyes, though the craftsman uses n aid to his vision. He draws fro the Taj and his own rich imaginatio

Although Ghulam Mohamad Ra thor of Jammu and Kashmir is onl


Shri Jagdishlal Soni's experiments of working gold on various coloured glasses have won him wide recognition. Some of his outstanding creations have been appreciated overseas also.

35 years old he has the experience of over two decades in carpet-weaving. weaving. Many of his carpets woven in famous designs like Tabreez, Kirman, Khorasan and Isphan have earned high appreciation from overseas buyers

A member of the Ghadwa tribal community of Baster, Jaidev Bhaghel Ghadwa has been practising the art-metal craft for over a decade Although, only 29 years old, he has acquired mastery in the techniques and processes of Dhokra casting He has improved upon the aesthetics of the craft while retaining his ancestors' techniques

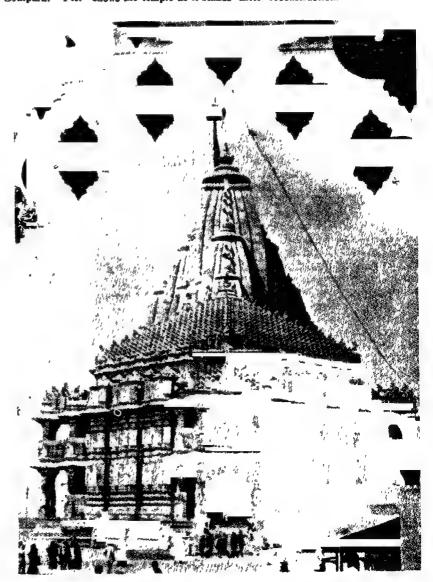
Thanka painting is the product of mind, nurtured on restrained imagination and religious devotion Tsering Wangdus, a resident of Leh in Ladakh is a mature hand in this craft whose paintings can be found in almost all the monasteries of Ladakh and even outside it A farmer by birth, wangdus studied local medicine called *amchi* for which he had no natural calling He met the famous Tibetan painter Shri Dewa Paksang under whose tutelage he learnt painting for over three years. Today he is an acknowledged master in Thanka painting.

The youngest craftsman to get an Award this year is Jagdishlal Soni He is also a graduate in history and holds a diploma in drawing Born in Pratapgarh Jagdishlal Soni took to the Thewa craft almost instinctively. Thewa work is gold work on glass. He has been in this trade for over ten years

Handicrafts are obviously labour intensive and therefore occupy a prominent place in the programme of employment generation.

In every country handicrafts form an important nexus for the cultural unity of the people. When objects into which tradition and culture are woven reach every home and hearth, they strengthen the social bonds They are the common objects of appreciation in terms of deeper symbols of integration. ☐

Shri Rashid Ahmed has been a potter almost since his childhood. He hails from a family of traditional potters whose ancestors were natives of Multan, about four centuries ago.

The Somanath temple has been revived from ruins by a modern Viswakarma, Sompura. Pic. shows the temple as it stands after reconstruction.


MAHARASHTRA

Breakthrough in Foodgrains Production

K.T. UPADHYA

MAHARASHTRA IS A deficit State in the production of foodgrains even though its dependence on agriculture is about 70%. The State requires about 110 lakh tonnes of foodgrains to feed its 5 04 crores of population as against the present production of about 70% of its total requirements. And with the anticipated increase of population to 6 04 crores by 1978-79, the foodgrains requirement works out to about 118 lakh tonnes.

Unfortunately about a third of State area has been facingt drought conditions for the last there to four years since 1970 The cultivation units being small, farming becomes uneconomic and eventually handicaps the necessary inputs The triennial average of foodgrains for the year 1969-70 to 1971-72 was only 450 kgs for the State as against All India average of 845 kgs. The Government has decided to take strong measures in bringing the agricultural productivity nearer to Indian Standards For this the State rightly fixed its objective to achieve near self-sufficiency in foodgrains production of 110 lakh tonnes for the Fifth Five Year Plan

In 1975, the Government of Maharashtra geared up all its concerned with foodgrains production This involved the departments of Agriculture, Irrigation and Power, Cooperation, Zilla Parishads and the four agricultural universities to work in a purposeful and coordinated manner, at all levels. The Co-operative Banks and the Nationalised Banks were entrusted with the extension of credit facility to all eligible farmers. The Nationalised Banks financing crop loans were placed on par, as far as possible, with the co-operatives in the matter of recovery The minimum scale of financing recommended per hectare was as shown in the table

It had been the responsibility of the Co-operative Department to ensure preparation of Normal Credit Statements well in time and the loans to be sanctioned and released latest by 15th May, 1975 to all eligible farmers. For this the Banks also were desired to accord highest precedence for sanctioning of loans.

The campaign involved 20 74 lakh hectares. For effective implementation of the programmes, coordination committees were set up in each district and block for planning and execution to ensure the coordination of a number of field agencies including Irrigation, Cooperation and Agriculture, although the primary responsibility rested with the Zilla Parishads.

The factors that were to make this programme a success were multiple The foremost was adequacy of irrigational facilities to food crops, wherever it was available. The existing irrigation was mostly utilised by cash crops and principally by sugarcane cultivation. Any cut therein would have adversely affected the network of sugar manufacturing units which have been sustaining agricultural and economic activities in the area, to an appreciable extent. Distribution of irrigation was to be arranged in such a way as to achieve an optimum production of both food and cash crops. In so far as public irrigation works were concerned, the State had directed that as far as possible, at least 50 per cent of the storage, was to be utilised for foodgrains production.

The quality of seeds was to be controlled and the permissible percentage of germination had to be ensured. For this, each bag of seed supply had to bear the mark of handlers at various stages, right from production till germination, and to arrange for tracing of faults at any point to enable sorting ou[t] and dealing with mistakes or irres[ponsibilities]. The required quanti[ties] of seeds were to be supplied b[y] the Taluka Seed Farms, the Nationa[l] Seeds Corporation and the fou[r] agricultural universities in the State

Through well organised distribu[tion] centres, the multipurpose co[-]operative societies provided inputs especially the fertilizers, in thei[r] normal credit statements with specia[l] attention to Kharif Programme But the area under hybrid and high yielding varieties formed roughl[y] one-third of total area under foo[d] crops and thus the normal credi[t] statements had to make provisio[n] for the other two-thirds of are[a] also. A large number of member[s] from credit cooperatives had becom[e] defaulters presumably due to pre[valence] of drought conditions durin[g] 1970-71 to 1973-74. Governmen[t] directives offered maximum advantage of the admissible subsidies, fo[r] inputs, in the area covered by th[e] schemes of Small Farmers, Margina[l] Farmers and Agricultural Labourer[s] Development Agency and I.A D.P blocks. The State had to be libera[l] in supplying inputs to cultivator[s] with the ultimate objective of attaining self-sufficiency through enhanced production of food crops. Th[e] State assured cultivators of a mini[mum] price at which it could procur[e] all the saleable produce in the even[t] of prices falling below the minimum This in turn reassured cultivators t[o] realise reasonably profitable return[s] on their inputs

The year 1975-76 was thus quit[e] a satisfactory year and there are al[l] indications substantiating a stil[l] more prospective agricultural yea[r] for the year 1976-77. □

Crop	Seed	Fertilisers	Pesticides	Total
	Rs.	Rs.	Rs.	Rs.
High yielding paddy	50.00	200.00	110.00	360.0[0]
Hybrid jowar	60.00	150.00	130.00	340 0[0]

Shri Upadhya is Assistant Director (Evaluation) in Programme Evaluation Organisation, Poona.

COORDINATION IS an indispensable adjunct of planning. This is more so in the field of nutrition programmes. Several Departments and agencies both at the Central and Provincial levels are involved in implementing nutrition programmes.

Nutrition programmes can be broadly divided into three major categories, namely (i) Supplementary Feeding Programmes; (ii) Applied Nutrition Programme; and (iii) Health Based Nutrition Programmes

Coordination is desirable in the sphere of feeding programmes in regard to beneficiaries and also in respect of various foodstuffs supplied

(Kerala Indigenous Food) production in Kerala itself may have to be watched carefully in this connection. State Governments may also be given a free hand in setting up of local units with the cooperation and advice of experts of the Food and Nutrition Board as well as of those belonging to the National Institute of Nutrition.

In the Fourth Five Year Plan a Nutrition Coordination Group was set up in the Planning Commission to coordinate various programmes included in the Nutrition Sector This Coordination Committee helped to solve immediate problems besides drawing attention on the long range

Coordination of Nutrition Programmes

A.K. NANDA

under the programmes. It is essential because the same beneficiary may secure food at times under more than one programmes although instances of this type are not many. Under the S.N P wherever feeding centres have been located close by, the possibility of the same beneficiary getting food from more than one centres cannot be ruled out. Coordination is also desirable in respect of foodstuffs supplied under the various feeding programmes although this is a gigantic task The number of beneficiaries at the end of the Fourth Plan under the Special Nutrition Programme was about 38 lakhs and the number of beneficiaries under the Midday Meals Programme was about 120 lakhs It would be nearly impossible to attempt coordination of food stuffs supplied under these feeding programmes (leave alone other feeding programmes like the demonstration feeding under the Applied Nutrition Programme) as the main ingredients of food are in short supply. The oil crisis has added a new dimension to this question. If feeding programmes on a massive scale are to stay, these will have to rely to a great extent on local production of foodstuffs. The experiment of KIF

Shri Nanda is Research Officer (Nutrition), Planning Commission.

aspects of nutrition programmes Gaining from the experience of this Committee, the Planning Commission also advised the State Governments to set up State level coordination committees.

The Committee on Pre-school Feeding Programmes of the Planning Commission has envisaged the following functions for the State Level Coordination Committees on Nutrition :

(i) To avoid overlapping in setting up feeding centres and in coverage of beneficiaries,

(ii) To work out as far as possible unform pattern of procurment, storage and distribution of foodstuffs,

(iii) To lay down guidelines for effective supervision and implementation of feeding programmes by coordinating the functions and responsibilities of field staff presently appointed under different agencies;

(iv) To work out in-service training programmes from time to time for field staff as well as for voluntary organisations involved in implementation of feeding programmes;

(v) To organise conferences and seminars from time to time on pre-school children feeding programmes;

(vi) To prescribe performance and obtain quarterly reports, regarding progress and to evaluate them from time to time; and

(vii) To examine evaluation reports on feeding programmes and take quick decisions of them

A recent review made by the State Coordination Committee shows that they are very useful bodies in implementing nutrition programmes. The Kerala State Government is of the view that the constitution of the State Level Coordination Committee has helped to avoid duplication and wastage of funds. The Maharashtra State Government has considered the State Level Coordination Committees to be very useful One major difficulty has been that these committees have not been able to meet regularly.

In the Fifth Five Year Plan, a Central Coordination Committee on Nutrition Programme has been set up in the Department of Social Welfare. The functions of the Central Coordinaiton Committee are:-

(i) To ensure adequate overall coordination among concerned Ministries/Departments at the Centre and between the Centre and States/Union Territories; (ii) To ensure systematic communication and consultation among the various agencies involved in the National Nutrition Programme, (iii) To set up adequate monitoring and evaluation machinery at the Centre and at the State level and watch the progress of various programmes to ensure harmonised and meaningful integration of nutrition with other programmes of health and family planning and environmental sanitation, etc. (iv) To keep a watch on the progress of expenditure and provide pooling of financial resources for nutrition at the Centre/State level for coordination and implementation of nutrition programmes. (v) To ensure proper utilisation of assistance from international and bilateral agencies for nutrition programmes; (vi) To review periodically the progress of research schemes pertaining to nutrition. (vii) To resolve problems pertaining to training and education in nutrition and any other matter concerned with nutrition; and (viii) To consider such other matters as may be necessary, incidential or conductive to the attainment of adequate nutrition level of the nation's population. □

A Socio-Economic Survey Of The Weaker Sections In A Haryana Village

R.D. GUPTA

A SOCIO-ECONOMIC survey of the weaker sections of a village Khanpur Kalan in District Sonepat (Haryana) was conducted by the Planning Forum, Rohtak University, on February 2, 1977 Khanpur Kalan is a big village consisting of 870 houses and a population of about 6000 The caste composition of the village shows that about 50 per cent of the population is Jat, 10 per cent Brahmins and 40 per cent Harijans The village has one Primary School and a High School At a distance of about 2 Kilometres there is a Gurukul for women which has a degree college, a training college (J B T & B Ed) and an Ayurvedic College for women About 20 households own tractors and there are about 100 tubewells and one Gobar Gas Plant Most of the persons have small landholdings averaging less than 5 acres

A random sample of 110 families comprising the weaker sections, mostly Harijans, petty traders, village artisans, sweepers etc was taken A family whose income from all sources was less than Rs 3600 per annum was taken to be a family belonging to the weaker section The nature and scope of the survey extended only over a day A large number of students who were given preliminary lectures and training of field survey techniques also participated The method of random sampling was found to be most feasible In fact, there was no alternative except the one that was followed and was found to be the most suitable under the circumstances

Abject Poverty and Debt Position

One of the most interesting features to come to light was that the village had large families inspite of three decades of family planning programmes The survey showed that 60 per cent of the families had members from 7 to 15 and hardly 18 per cent of the families were really small having members less than 5. The analysis of the existing members in various families showed that 76 per cent of the families had earning members upto 2, and 20 per cent had earning members between 3 and 4 and the rest had more than 4 earning members The analysis clearly shows that the demographic structure is highly distorted and the number of dependents in the family is quite large which seems to be the major cause of abject poverty in the village The study about the survey of borrowings in the village showed that about 51 per cent villagers continue to borrow from traditional sources, like village moneylenders and landlords 25 per cent persons refused to disclose their sources of borrowings Hardly 24 per cent persons were making use of the only mini-bank and one commercial bank in the village The major reasons for not borrowing from the mini-bank or commercial bank were the requirements of security and the consequences, if loans are not returned in time A comparison of money borrowed in 1975-76 and 1976-77 showed that the indebtedness had decreased reflecting an improvement in the economic well-being of the people About 60 per cent households had no standing debt, 14 per cent households had a standing debt between Rs 300 to Rs 600 and about 24 per cent people had a standing debt of more than Rs 1000 A major part of the outstanding debt was for productive purposes

Reactions to Questions

Asked about the general price level during the last two years, about 64 per cent of the persons held the view that prices had increased, 24 per cent responded that prices decreased marginally and the rest 12 per cent replied that there was no change On asking whether their economic situation had improved during the last two years, about 64 per cent told that it had deteriorated, 25 per cent told that it had improved and 11 per cent found no change in their economic well- being

A surprise find of the survey was that 71 per cent of the people in village had not even heard about the Five Year Plans Of the people who knew about it, only 47 per cent felt that planning is useful for the country 51 per cent said that there was really no programme for the development of the villages Most of the people felt that they were gaining very little from the Government agencies, if any, and complained that there was no arrangement for the cleanliness in the village 85 per cent expressed the view that they would like an increase in employment opportunities in the village itself and were against going to far off places for employment purposes unless compelled by economic circumstances ☐

Books

Growth Calculus of the Bean Stalk

Functioning of the Life Insurance Corporation of India—An Appraisal *by Prof. B.S.R. Rao; Institute for Financial Management and Research, Madras,* 1976; *pp* XX+391; *Rs* 45.

THE L.I.C., as the foremost non-bank financial intermediary and an important constituent of the Indian capital market, has been performing the vital role of transforming savings into productive investment in the economy. This study covers the span of its existence during the last two decades under the stewardship of ten chairman through a stormy period of India's development when its message was sedulously spread amongst the income earners. By international comparisons of the compound rates of growth L.I.C.'s performance has not been too unsatisfactory. However, the study underlines the potential for growth in business that is available through various means of attracting the household sectors towards its new schemes tailored to the needs of policy-holders and serving their needs

The introduction coupled with an excellent review, supported by facts and figures, conducts the reader to the core of the study dealing with a critical assessment of the functioning of the organisation in Chapter three. This is followed by a study of its investment patterns and the summing up. The virtues of nationalisation are not overstressed in the study. However, far from resorting to impressionistic appraisals, the author's painstaking analysis of the shortcomings have been buttressed by the Director, IFMR by policy suggestions for improvement that are compelling in their viability and focus on urgency.

The author finds the rise of per capita life insurance in India from Rs 34 at the end of 1957 to Rs. 220 at the end of March 1975 as having belied the expectations after the nationalisation of life business. As stated already, the compound growth rate of 13.6 per cent per annum during 1957–75 is considered inadequate. Group business remains to make rapid headway. The life insurance carrying capacity of the country remains to be fully exploited through the strengthening of the zonal offices. The relative levels of the educational levels of the strata of households, income levels etc., have a great deal to do with the differential lags highlighted by the study in regard to the performance of the zonal offices, the lag is procuration of new life business and the average sum assured per policy zone-wise as against the all-India average. The reasons for the great popularity of endowment assurances vis-a-vis whole life policies have also a certain economic significance that requires to be fully explained in our socio-economic context This has not been the forte of the LIC policy makers so far.

The author has carefully analysed the main chinks in the LIC's armour. Too high overall and renewal expense top heavy administration, a hig lapse ratio, delays in the dispos of claims, rigidities in the premiu rates etc., albeit discussed in genera have been given rationale and sub stance by the author through em pirical exercises. There is, indeed scope for repeating them in crucia areas and expanding operations o new lines preceded by the adoptio of financial analysis and managemen and tempered by qualitative charac teristics of the policy-holders.

Similarly, the analysis of the invest ment patterns in Government secu rities, loan operations particularl their dwindling tendency towards th private sector, deliberate choice o schemes of social and public impor tance e g housing, the need to ste up the yield on investment, under writing operations, the restraint placed by the Government on the and their consequences etc., hav received adequate treatment in th book.

The book is of considerable valu for specialists of Indian Finance policy-makers and to all those con cerned who are eager to grasp th significant strides taken by a natio nalised institution firmly weatherin many storms and sailing toward the goal of our full development Both the author and the authoritie of the IFMR, Madras, deserv special thanks for this worthy con tribution to advance systemati thought in this field

—B.N. Nai

Public Finance

Indian Public Finance and Financial Administration *by K P.M. Sundharam and E N Sundharam; published by Sultan Chand and Sons, New Delhi, Sixth edition,* 1976; *Pages* 384; *Price Rs* 14.

EVER SINCE the first edition of this book was published in March, 1972, this book seems to have become quite popular for it is now in its sixth edition. The book is primarily meant for undergraduate students of Indian universities. In its two separate parts, the book deals with the various facets of public finance both in theory and in practice. The first part contains 14 chapters while there are 10 chapters in the second part

The authors have usefully updated the economic data of the applied part of public finance. Among the important topics discus sed are the budgets of the govern ment, centre-state financial relations public sector enterprises and finan cing of five year plans However it would have been better if th authors had also given the sourc of their data which is conspicuou by its absence in many of the quan titative tables contained in the book

There is an important chapte on agricultural taxation in India It elaborately deals with the K.N Raj Committee proposals for addi tional taxation on agriculture. I also makes a critical assessment o the said proposals.

. All in all, the book will prov useful for students of economic and commerce and will meet thei need for undergraduate examinations

Financial Planning and Development

Financing Economic Development: *by A.P. Thirlwall: Published by the Macmillan Press Ltd, London and Basingstoke: Pages 95; Price Not mentioned*

ECONOMIC DEVELOPMENT is the most important goal of the economic and political policies of the majority of governments of the less developed countries of the present day world. To achieve this objective the chief instrument selected by many such countries is economic planning. Finance is the most essential aspect of planning for economic development. Whatever be the size of plan, it can be successfully implemented only when adequate financial resources become readily available as per needs of the plan. But, capital deficiency is one of the major problems which many of the developing and less developed countries face. It is necessary, therefore to pay due attention to the aspect of financing development plans.

There are various sources from which resources can be raised to execute the programmes incorporated in the plans. Some of them are internal and some external. In the book under review, an attempt has been made by the author to present the main analytical models that economists use in discussing finance for the development of developing countries'. Measurement of resource requirements has been given in the first chapter, with special emphasis on the dual-gap analysis. The subsequent chapter deal with raising of finances from domestic sources, through trade and from external sources.

While discussing financing of development from internal sources in the second chapter, three main approaches, the classical approach, the Keynesian approach and the Quantity theory approach were considered. In the third chapter, while considering the aspect of financing development through trade such aspects as 'grains from trade', 'the relation between exports and saving and export-oriented growth' were discussed in separate sections. Similarly, while analysing the problems of financing economic development through external sources in the next chapter, models of capital imports and growth were considered together with such topics as 'the measurement of aid component of international assistance' and other related aspects. In addition, a good account of the potential role of Special Drawing Rights in financing development has also been given.

As the author himself admitted in the preface, the book makes no pretence to be original. However, the ways in which it outlines the major issues in the field of financing economic development is quite impressive and interesting

A. Tirupathi Raju

Personnel Management and Human Relations

The Spectrum of Industrial Relations *by Bagaram Tulpule, Indian Institute of Personal Management, Durgapur* 1975; *Pages VIII* +70; *Price Rs* 15

BUDDING TECHNOCRATS generally find themselves ill-equipped for the task of personnel administration, despite their bookish knowledge. They find a yawning gap between the management of machines and the management of men. It is this gap which, the book under review tries to fill. Its scope is the whole gamut of personnel management beginning from the origin and browth of trade unionism to the shape of things to come in industrial relations

The fact of strained industrial relations is regarded as a part of life in industrial situations. The author, a trade unionist-cum-executive gives an inside view of the problems of labour and management. His approach to the problems is paragmatic, simplistic and unbiased

After introductory observations the nature of industrial relations is examined the predisposition of the parties which give a kind of 'Charge' to the field in which labour and management have to regulate their relationships, the patterns and basic dynamics of industrial conflict, are some of them

Since trade unions play a crucial role, the author dwells into the history of trade union to explain the validity of their existence. He contends that so long as there is conflict of interest, there will be need for adjustment of interest. And since, trade unions thrive on demands, the management can meet them within certain limits leaving scope for discontent.

A disturbing factor in industrial relations, which according to the author should not be glossed over, is the presence of economic gap between management and labour. To the labour this gap is a sign of social inequity and he will always fight to narrow down this gap.

Hopefully they are entering into a new era of conciliation. Trade union movements nowadays advocate the socialistic ideology. They have started talking less of wage increases and more of participation in management, equal rights, better housing, etc

Finally, the author has a word of advice for the aspiring technocrats: inculcation of ethical principles in industrial relations. "Human relations can work, if it is really, an objective or a philosophy that you accept, a personality style that you have developed within yourselt basically out of a deep sympathy for fellow humans whether they work above you or below you in the hierarchy".

—R. Muralidhar

FRUIT TREES IN ARID REGIONS

A large area in our country can be classified as arid. With poor or no rainfall and lack of irrigation facilities—what with high temperatures prevailing field crops are not practical or promising in these regions. Planting of fruit trees by *in situ* method can be made use of to solve this problem to some extent. *In situ* planning means raising a plant at the site where it is intended to grow in to a tree.

R.G. Maiti

STUDIES ON THE root system of dicot trees show that the tap-root grows down into the earth and is, therefore, capable of drawing moisture from deep layers of the soil, while branch roots and advantitious roots mostly grow near the surface of the soil which is readily subjected to drying. Thus plants with tap-roots are better adopted to drought conditions than those with superficial root system Tap root system also gives greater anchorage to the plant against wind.

As a rule, fruit plants are first raised in the nursery and then transplanted to the orchard. During this process the tap-root of the plant is damaged. Such plants, therefore, thrive by developing their branch-root system.

In arid regions where the rainfall is less and evaporation is greater due to higher temperature and drier atmosphere, while irrigation facilities are limited, a plant with tap-root system is preferred. Such a plant can be obtained by planting the seed where the tree is to grow. Since the seedling tree is not likely to be true to its mother, and often inferior to it, it is necessary to change the shoot system of this seedling by budding or grafting it *in situ*.

There are certain fruits which are specially adopted to the arid regions. Mention may be made of pomegranate, ber, guava, fig, mulberry, bel, custard apple etc. in this group. Budding is successful on most of them. Mango and malta may be tried under more favourable conditions. Mango may be worked upon by chip-budding and veneer grafting and malta by T-budding. Even for grapes budding *in situ* should be preferred to cuttings.

In all the above cases rootstocks should be raised from the seeds of inferior varieties or species which are hardy and capable of growing vigorously in conditions under question. For windbreak and hedge of the orchard *jamun* and *karonda* should respectively be used. The two plants are to be grown from seed without any budding or grafting operation

The most important thing for *in situ* planting is the digging of pits Never a planting pit should be less than a metre both in depth and width. There should not be a solid stone direclly underneath it. The pit should be filled up with soil impregnated with at least 30 kg of cowdung manure or farmyard manure. For hedge a trench—one metre wide and one metre deep—should be dug and manured @30 kg. of the above manures per running metre. Any departure from the above recommendations may mean failure for the orchard.

All preparations should be completed of the rainy season. When the soil of the pit settles down after a few showers sowing of seed should be done after levelling it properly. Soon after germination the tap-root will penetrate downwards and reach the bottom of the pit before the coming winter. A little watering may be necessary in the following summer. Afterwards the plant will grow of its own. Changing operation of the shoot should be done at the appropriate time. Regular manuring should be done during the rainy season where irrigation is not available.

In situ is an important method of fruit growing in the arid regions. This method can be successfully followed in sloppy grounds also. This method not only cuts down the cost of irrigating the orchard, but it also makes orcharding possible in areas where irrigation facilities are limited. In Orissa and some other states this method is being exploited successfully. ☐

Dr. Maiti is with the Bidhan Chandra Krishi Viswavidyalaya, West Bengal

Why Children Suck Thumbs

FEW PARENTS today worry too much if a child sucks its thumb: medical opinion has swung away from the belief that the habit is evidence of the child's insecurity or that it will cause permanent distortion of the teeth. Yet there is still much argument about whether thumb-sucking is normal. A recent research report from Turkey offers a simple explanation that conforms with common experience.

Two Turkish psychiatrists set out to identify any differences between thumb-sucking children and those who never or hardly ever suck their thumbs or fingers. More than 600 children aged between one and seven and their mothers were examined.

The children who sucked their thumbs had in general stopped breast-feeding several months earlier than the others. The thumb-suckers were more likely to have been fed on a regular schedule rather than on demand and they came more often from educated families.

The most striking difference, however, was in the mother's routine for getting the child to sleep at night. When the mothers stayed with their babies, singing to them, rocking them or continuing to offer the breast or a bottle until the child went to sleep, the children hardly ever sucked their thumbs as they grew older. In contrast the usual pattern with the thumb-sucking children was that the mothers left their rooms after putting them to bed leaving them to go to sleep alone.

Turkish psychiatrists believe that sucking is a reflex activity that occurs during light sleep or at the time of going to sleep. If an infant is being fed by breast or bottle while falling asleep he is unlikely to form the habit of thumb-sucking and if he is being rocked in a cot or on his mother's lap the sucking instinct may be deterred.

In contrast children left alone without breast, bottle or dummy or other soothing stimuli will they argue develop the habit of thumb-sucking. Gradually they will extend it to other stresses, such as hunger and anxiety, and the habit may then persist throughout childhood.

—From "The Times, London"

Development Notes

Steel Export Board Soon

An export board is being formed for steel. The board will work out a strategy to maximise the foreign exchange earnings without affecting domestic availability. The board will include representatives of the government, main producers and re-rollers.

The export board will work out market strategy and co-ordinate the steel exports covering the total system of steel producers. At present domestic market has yet not been able to absorb fully the production of bars and rods from all the producers. Even if it picks up with the improvement in the construction activity, there is adequate production capacity in the country together with the mini steel plants to meet requirements of the domestic market fully.

Exports of bars and rods will improve the domestic markets and the mini steel plants will be in a position to market their production in a better manner.

The tube industry, with the assistance of the SAIL International, will also diversify their exports to markets in the US and the Continent which could not be explored earlier. The tube makers exported nearly two lakh tonnes in 1976–77.

Coal, Limestone Found in Assam

The recent exploration programme for coal and limestone in parts o Assam has established an estimated reserve of 1840 million tonnes of coal and 121 tonnes of limestone

The state's geology and mining department had taken up an exploration programme for coal in Jaipur-Dilli-Bimolapur belt (Dibrugarh and Sibsagar districts), Kollajan and Sheelvata coal deposits (Karbi Anglong district), and at Singrimari (Goalpara district). The department also carried out exploration in the limestone belts of North Cachar and Karbi Anglong districts.

Solar Power Sets

BHEL and Messerochmitt-Bolho-Blohm, Gumbh (MBB) of West Germany have signed an agreement to jointly develop a 17 Kw solar electric power generating set.

The set will use flat-plate medium temperature collector for collecting the solar energy. The heat will be used to vapourise an organic compound which will drive the prime mover. The prime mover, which is a screw expander and operates on the same concept as a screw compressor, used commonly in refrigerating machinery, will in turn drive the electric generator.

Handloom Development in M. P

The M.P. State Textile Corporation has launched an intensive handloom development project and a handloom cloth export scheme.

Under the Rs. 1.85 crore project, two thousand handlooms would be modernised every year and arrangements will be made to market the produce. In all 10,000 handlooms will be modernised in the next five years. More than 1500 handlooms have already started production with improved looms. The Corporation has opened offices at Raigarh Bilaspur, Raipur, Durg, Sounser, Waraseoni, Pandhana, Mandsaur and Khargone for successful implementation of the project.

The Corporation has also started production and sale of cheap 'Janta cloth'. The cheap cloth and the 'Janata Sari' are being produced in Bilaspur, Raipur, Chhindwara, Balaghat and Rajgarh districts of the State. The produce is being marketed through the cooperatives and consumers' stores. The Corporation has already sold 33,000 cheap 'Janta Saries' in the State.

FACT's Production Goes Up

The Fertilisers and Chemicals, Travancore Limited (FACT) has achieved new heights in production during the year ended March 1977.

Production in terms of nutrients for agriculture in the Udyogamandal Division as well as Cochin Division has been the highest achieved so far in any year, despite six week power cut during the year.

In Udyogamandal, nitrogen in the end products touched an all time high of 45,289 tonnes and P_2O_5 in finished products at 23,333 tonnes.

Among individual items, the annual production of phosphoric acid stood at 21,700 tonnes and ammonium phosphate at 98,000 tonnes wh were new records.

Higher production in Ud gamandal Division has a resulted in higher earnings workers in the form of prod tion bonus. Payments in t connection amounted to a cord figure of Rs. 13 lal during the year, which wo out to 7 per cent wages worker, every month.

FEDO to Build DDT Plant for HIL

FACT Engineering and Design Organisation (FEDO) has been selected by Hindustan Insecticides Ltd. for rendering consultancy and site management services for their 5,000 tonnes per year DDT project to be based on HIL's technology at Rasayani in Maharashtra.

Under the terms of this agreement FEDO will render technical services for the setting up of production facilities including civil works making technical DDT (5C tonnes/year), DDT formulat product (10,000 tonnes/yea effluent treatment and assoc ted off sites, township et

The project is estimat to cost about Rs. 82.5 milli with a foreign exchange co ponent of Rs. 0.60 millic By the setting up of this pı ject the saving in forei exchange for the country estimated at Rs. 84 millio

Irrigation Canals for Doon Valley Planned

The Uttar Pradesh irrigation department is considering the proposal to construct 72 km of canals in the Doon Valley involving an expenditure of about Rs. 1 77 crores When complete, these canals will bring an additional area of 4,200 acres under irrigation. It is expected that the additional irrigation facilities will help increase foodgrain production by 36,000 quintals. There has been marked improvement in irrigation facilities by repair and maintenance of the existing canal system in the Doon Valley. Repairs during the last financial year at a cost of Rs. lakh had enhanced the wat discharge in the canals 15 cusecs, thus bringing additional area of 1,500 ac under irrigation which shou increase the production foodgrain by 4,000 quint in the rabi and kharif cro For obtaining 15 cusecs water a sum of Rs 24 cror would be required if new cana are built When the Lakhw multi-purpose dam on t Yamuna is completed by 19 water discharge in the feed canals, particularly the Ka Pathar canal, will rise treme dously

IDPL Bags Afghan Orders

Indian Drugs and Pharmaceuticals Limited is likely to bag an export order worth Rs. 1 4 crores for its drugs from Afghanistan IDPL, has already secured an export order worth Rs. 60 lakhs from Afghanistan, the Soviet Union and other countries for its formulations, drugs and instruments Besides, it has entered into an agreement with SCDIMA, an Arab multinational company, under which Indian technical know-how will be provided for setting up drug and pharmaceuticals plants in 13 countries of the Arab world

In the field of import substitution too, IDPL has done well, IDPL has achieved tec nological self-sufficiency in of the 34 essential drugs manufactures. With the con pletion of its Rs. 56 cro expansion programme for th production of bulk drugs an formulation by the end of th Fifth Plan IDPL will hav achieved self-sufficiency in re pect of drugs in its range c productionn. Besides expan ding production facilities a its Hyderabad plant fron the present 1,700 tonnes t 3,387 tonnes and doubling ant biotics production at the Rishi kesh plant, IDPL is also settin up two new plants at Muzaff arpur in Bihar and Gurgao in Haryana

Fertilisers On Credit For Farmers

Chemical fertilisers will be supplied on credit to farmers in Jammu and Kashmir during the current kharif.

The facility will not, however, be available to those who have defaulted in the repayment of fertiliser loans ad vanced to them during th last two years or to those wh have such credit facilities avai lable by virtue of being mem bers of one or more coopera tive institutions.

CIL Designs Smokeless Appliances

Coal India Ltd has designed industrial and domestic appliances for checking air pollution It has also evolved smokeless domestic fuel using middlings and low grade coal CIL has also produced a prototype of chulla (oven) and burner which would eliminate smoke. The CIL proposes to entrust the manufacture of chulla to young entrepreneurs in various states. The cost of chulla would not exceed Rs 15, it is hoped it would be popular in western region of the country which was pollution conscious. It would be acceptable particularly among the low income group of people who would save as much as 50 per cent on fuel

In order to meet the requirement of urban population, CIL had started manufacturing smokeless domestic fuel Such efforts would help CIL to convert large stocks of middlings and low grade of slack coal into domestic fuel It has also taken lead in undertaking the manufacture of stokers, arresters and forced draught arrangement in their Korba workshop on an experimental basis

During the current year CIL will ensure availability of coal for domestic use and cotton industries by encouraging distribution through co-operative and retailers as far as possible

Punjab To Develop Fisheries

A sum of Rs 30 lakh is proposed to be spent by the Fisheries Department of Punjab during the current financial year to promote pisciculture in the state This would be around Rs 3 lakh more than the amount spent in 1976-77

There are nearly 3100 hectares of water area in the village ponds and tanks of Punjab, which could be utilised for promoting pisciculture At present only 500 hectares of water area have been stocked For stocking and restocking these 500 water hectares, nearly 50 lakh fish-seeds are required, of which, the department was able to secure only 5 6 lakh

Shortage of fish-seeds is the main problem faced by the state To remedy this, it is proposed to set up fish-seed farms in almost every district Such farms have already been set up in Raja Sansi (Amritsar), Hayatnagar (Gurdaspur), Bir Shikargarh (Kapurthala), Bir Dosanjh (Patiala), and at the Punjab Agriculture University in Ludhiana

Record Output By Public Sector Projects

The nine public sector undertakings under the Department of Industrial Development reported a total profit of Rs 4 56 crore during the financial year 1976-77 According to official figures, the total production of these undertakings during the period touched a record level of Rs 122 70 crore against the target of Rs 125 43 crore, an achievement of 97 82 per cent of the annual target Two undertakings —Hindustan Photo Films and Instrumentation Limited -exceeded their annual targets while four undertakings achieved more than 90 per cent of their target They were National Instruments Limited (98 7), Nepa Mills (96 23), Hindustan Cables Limited (95 97) and Cement Corporation of India (94 73)

The Tannery and Footwear Corporation, however, achieved only 84 42 per cent of the target and the Hindustan Paper Corporation 67 53 per cent During 1976 77 the total sales of these nine undertakings amounted to Rs 124 95 crore against the target of Rs. 127 49 crore They exported goods worth Rs 2 4 crore while the target was Rs 2 9 crore In March this year, the production in the units was Rs 11 8 crore against the target of Rs 11 27 crore indicating an achievement of 104 6 per cent of the target This was 7 68 per cent higher than the production of about Rs. 10 9 crore in March last year

Rock Phosphate Production Increases

The production of rock phosphate in Andhra Pradesh is picking up with the commencement of mining operations by the public sector Pyrites, Phosphates and Chemicals Limited. Rock phosphate is available in Kasipatnam tribal area of Visakhapatnam district in Andhra Pradesh It is not exploited to the desired extent owing to the absence of infrastructure facilities such as roads, electric power supply and mechanisation of mining operations

According to rough estimates, about one million tonnes of rock phosphate of high grade with over 35 per cent P205 content is available at Kasipatnam. The present production of this rock is around 8,000 tonnes per year —mostly by private enterpreneurs. The public sector Pyrites, Phosphates and Chemicals Limited which took up mining operations since 1976 is producing about 2,000 tonnes per annum. Large scale exploitation of rock phosphate, in view of its importance is becoming uneconomical owing to non-development of infrastructure facilities which contribute to high cost of production

India, every year imports between 8 to 10 lakh tonnes of rock phosphate from Jordon, Morocco, Senegal, Tunisia and the U S The indigenous production, placed at around 5 lakh tonnes, per year sufficient to meet only 50 per cent demand of the phosphatic fertiliser producing units, is mostly from Rajasthan. A major part of import of rock phosphate by the local Coromandel fertiliser factory can be met by Kasipatnam mines, if systematic efforts are made to exploit the mines here by providing infrastructure facilities. Coromandel fertilisers in Visakhapatnam imports about 3 lakh tonnes of rock phosphate per year. The demand for rock phosphate may rise rapidly in view of increased production of phosphatic fertilisers by the fertiliser units in the country following increased consumption as a result of cut in prices of phosphatic fertilisers.

Tropo Link With Moscow

The establishment of a troposcatter link between the Soviet Union and India, envisaged in the agreement signed between the two countries recently in New Delhi, will be a unique system of communication

The link makes use of the troposphere, which is the lower portion of the atmosphere, to send the signals It also takes advantage of two high mountain peaks to diffract the signals The present method of operating telecommunication services between India and the Soviet Union through the normal radio links suffers from inherent limitation of capacity and quality due to disturbances in the ionosphere

This project, which will be implemented by the Overseas Communications Services of the Ministry of Communications, will have two terminal stations for this link One at Srinagar in India and the other at Tashkent in USSR. The link will have 12 channels initially to be expanded to 24 channels later on. It will provide large capacity and reliable communication facilities between the two countries

The estimated cost of the project for the Indian station is Rs 3 9 crores with a foreign exchange component of Rs. 92 lakh. While most of the equipment will be made in India, certain specialised sub-systems of equipment will be imported from the Soviet Union

Synthetic Textiles Export Exceeds Target

Exports of Rayon & Synthetic Textiles reached an all-time high of Rs 38 52 crores during the year 1976–77 This performance is not only more than double of that achieved last year which was Rs 17 79 crores but has exceeded the export target for the year 1976 77 by over Rs 1 00 crore Exports during 1976 77 represent 117 per cent rise as compared with the achievement of the previous year

Fabrics which constitute a major share of exports of rayon and synthetic textiles were valued at Rs 31 5 crores, hosiery and knitwear Rs 1 2 crores, and miscellaneous items including rayon Yarn, etc Rs 3 36 crores The Silk & Rayon Textiles Export Promotion Council expects a substantial increase in export business in the current year and accordingly, has set a target of Rs 60 00 crores. In order to achieve this target the Council has chalked out a programme in which visits by foreign trade delegations and tours of Indian Study and Sales Teams figure prominently.

ITI Gets More Export Orders

The state-owned Indian Telephone Industries exported equipment worth Rs 1 70 crore during 1976 77. ITI has now export orders worth about Rs 3 23 crore The company has entered the Omani market in a big way securing a Rs. 20 million order for the supply of materials and installation of 3,000 telephone lines.

As regards production the ITI produced equipment worth Rs 83 06 crore during 1976-77 against a target of Rs. 80.62 crore.

BUDGET

Success Stories

THEY DID IT

Disang Rangchual Gaon with about ten villages around it under Jaipur Block in the Dibrugarh sub division is a back-ward area particularly in relation to communication and rural sanitation. The population of the area is about fifteen thousand comprising plains tribals and other backward classes. The people so long had either to go on foot a distance of more than fifteen kilometres to the nearest health centre at Naharani to get medical aid or surrender to their fates to avoid all such irksome journey. But as lotus grows on mud a noble idea came to the mind of these backward people. They took decision to have a health centre of their own, contributed according to their individual capacity, collected about rupees twenty two thousand (Rs 22,000) in cash beside a plot donated by one of the generous co-villagers. Then came siamdan from the members of the local mahila samities Yuvak Kendras and the students as well. The beautiful three roomed building with a specious verandah and a staff quarter came up as "Disang Rangchual Rural Health Sub-Centre" With the ceremonial opening and formally taking over of the centre by Assam Government recently the face of the area has changed and a pride of success could be observed in their smiles on the auspicious opening day.

Accent on Youth

The Rural Citizens' Forum at Vattipparampu in Erattapatti Block area (Kottayam District) set up under the auspices of the Kottayam field publicity unit has made significant progress in utilising youth power for constructive purposes The Forum which has 37 active members most of these are educated. but unemployed men—contributed one third of the voluntary labour required for the construction of a public well Starting with this work the Rural Citizens' Forum constructed houses for two poor settlers at Vettipparambu They collected money and paid it to a Harijan settler for the construction of his house and another harijan settler was given a small plot. The dynamic young men of the Forum broadened and repaired about one kilometre stretch or road linking Poonjar to Vettipparambu. Carried out under the Food for Work scheme, the work done of this road was worth about Rs 17000 During the observance of Community Development Week the Forum was able to construct a small house for a homeless settler At present the members of the Forum have taken up the work of constructing several rural roads in the area

BUDGET FOR A NEW ERA

Perhaps no other presentation of Union budget in the last 30 years evinced so much expectation and so much anxiety as the one this year The Union Finance Minister Shri Patel was confronted with the task of containing of inflation and implementing the promises of the Janata Party. He has very rightly chosen stuk to that line and not come out with the wide range of reliefs in taxation, direct or indirect assiduosly sought by businessmen, workers, employees, traders and professionals including urban tax-payers. Shri Patel has reduced the budgetary gap to Rs. 72 crores only even after a substantial increase in the developmental outlays. In the same way, while the minimum income tax unit in case of individual has been raised to Rs. 10,000 which will benefit about 8.2 lakh income-tax payers, pressure on higher income earners has been much more than what was expected. This has been done by restoration of the surcharge on income-tax at the rate of 15 per cent, continuation of the compulsory deposit for another two years and raising of wealth tax (though not very much).

The Finance Minister has also exempted the Corporate Sector from the incidence of increased surcharge but has made purposive the scheme of investment allowance which was already in operation. This scheme has been further liberalised to bring within its scope all industries except the industries which are in low priority sectors. With an eye on self-reliance, a liberal investment allowance of 35 per cent has been allowed on machinery and plant installed for the manufacture of any article with newly developed domestic know-how.

The allocation of Rs. 3054 crores for agriculture and related sectors like irrigation, fertilizer and power, which constitute 30 per cent of the entire plan outlay is unique. Besides this Rs 40 crores have been alloted to roads, building and drinking water in in the country

The continuation of Compulsory Deposits Scheme for another two years and the enhanced excise duty on branded bidi' has not been well received by the people; but if the funds alloted are effectively utilised this budget will stimulate the economy and generate investment in areas hitherto neglected.

Highlights of the Union Budget-1976-77

The first Budget of the new Governmet seeking "to accelerate the pace of economic progress and to distribute its fruits equitably under a framework of democracy ond individual freedom" was presented by the Finance Minister, Shri H.M Patel, to the Parliament today.

In the Budget estimates of the currentyear, the total receipts are estimated at Rs 15,366 crores. Gross tax revenues at existing rates of taxation are estimated at Rs. 8,879 crores, showing an increase of Rs. 798 crores over the revised estimates for 1976-77.

Of this increase, Rs 101 crores will accrue to the States as their share of taxes. While Union excise duties are expected to yield Rs 4,550 crores showing an increase of Rs. 373 crores over the revised estimates for the last year, receipts from income and corporation taxes are estimated at Rs 2,258 crores, an increase of Rs 180 crores Customs receipts at Rs 1.734 crores will be higher by Rs. 243 crores as compared to last year

Market loans are expected t yield Rs 1,000 crores as compared to Rs 849 crores in the previous year. Besides, the Government propose to borrow Rs 800 crores against drawal of foreign exchange reserves Net external assistance after providing for repayments and interest payments is estimated at Rs 1,052 crores including disbursements against new credits

A provision of Rs. 5,790 crores has been made in the Central Budget for 1977-78 for the Central Plan and assistance towards Plans of States and Union Terriotories as compared to the last year's provision of Rs. 4,759 crores, thus maintaining the tempo of development.

Non-Plan Expenditure

To observe the utmost economy in expenditure, keeping in view the present Government's emphasis on austerity and avoidance of all forms of ostentation, detailed instructions have since been issued in this regard for strict compliance by Ministries and Departments The full impact of economy measures will be known only after the detailed exercises have been completed Certain areas of non-essential expenditure have already been identified and the Budget documents reflect the reduction of about Rs 130 crores to this expenditure as a result of this exercise

Deficit

Taking into account the expenditure both on Plan and non-Plan accounts and the estimated receipts at the existing levels of taxation, the Budget for the current year shows a deficit of Rs. 202 crores

In the estimates of non-Plan expenditure, the provision for Defence expenditure is Rs. 2,752 crores, Rs. 56 crores less than the provision made in the interim Budget. The provision for food subsidy and carrying cost of buffer stocks have been for the present retained at Rs 460 crores. This will, however, be reviewed on the basis of emerging trends during the course of the year.

The net interest liability of the deficit States, as recommended by the Sixth Finance Commission has been computed and a provision of Rs 72 crores has been made in the Budget for disbursement of additional grants-in-aid to the States concerned on this account, in relation to the three years ending March 31, 1977.

Relief For Pensioners

The Finance Minister said th he had received requests from Centr Government pensioners for a increase in the quantum of reli on their pensions in view the high cost of living He ha therefore, proposed a special reli at graded rates to them costing tl exchequer Rs 10 crores annually

Annual Plan

Regarding the outlays on tl Annual Plan for 1977-78 the Finan Minister said that the Plan strateg has to be reappraised so that o economic ills could be overcon through a comprehensive reorderir of plan priorities The reconstitute Planning Commission would, r doubt, address itself to these task Meanwhile, the Government ha made a quick review in consultatic with the various Ministries and trie to impart "a new direction to o development programmes in lin with the priorities and objectives s out in the manifesto of the Janai Party". Despite serious limitatio in refashioning the Plan "accordir to our thinking", because of tl commitments already made, the roo for manoeuvrability was limite We were not writing on a clean slat he said Even so, appreciable savin have been effected and schemes c relatively low priority have bee suitably rephased.

The Finance Minister said th true to the promises made to tl people, in the recasting of the Pla provision has been made for additic nal outlays for agriculture, irrigatio power, khadi and village industrie sericulture, handlooms, postal an telephone facilities in rural are and wide ranging rural infra-structu programmes covering such schem as durable link roads and rural dri king water supply. It was his inte tion to step up the further outla next year on programmes designed t develop rural infrastructure faciliti so that over a period of about fi years, the basic needs of the enti rural population could be met.

Integrated Development

Emphasising the importance (

making integrated development of crop production, livestock, poultry, fisheries and forestry, the Finance Minister said that special emphasis will need to be laid on developing dairy industry on a co operative basis with a view to enabling milk producers to get better and fairer price. The production policy should be based on, modernisation of agriculture in which technology should, by far, be the most crucial input to make a sustained and high rate of growth possible The existing Plan provisions and priorities have been rephased for plugging gaps in developing and identifying potential areas to bring about further acceleration of the phase of agricultural growth. This will include strengthening rural infra-structure as the basis for future accelerated development, generation of employment in rural areas, special attention to the needs of the weaker sections of the society and giving fillip to the production of cotton, oilseeds and pulses so as to correct the supply and demand imbalances

Desert Development

A pilot project for desert development in Haryana, Gujarat and Rajasthan is being evolved and provision has been made for this purpose in the Budget estimates.

Irrigation

Rs 100 crores have been provided as Advance Plan Assistance to the States for irrigation projects The Plan outlays for minor irrigation will be supplemented to the extent of about Rs 260 crores fom the Agricultural Refinance and Development Corporation Rnd other lending institutions Under the programme

Agriculture Gets 30% of Total Plan Outlay

of rural electrification for energising the pump sets, a provision of Rs 175 crores has been made which will also be augmented to a significant extent by institutional finance

Agriculture

The total Plan outlay on agriculture and allied services, major, medium and minor irrigation projects and fertilisers, together, with provisions foi co-operatives and power sectors attributable to rural areas, works out to Rs 3,024 crores. This constitutes happily 30.4 per cent of the aggregate outlay of the Central, State and Union Territories Plans.

Rural Development

Regretting that the needs of the rural areas had been sadly neglected, the Finance Minister said that the Centre should take the initiative in promoting the construction of approach roads which constitute an essential ingredient of any programme for building up the infrastructure for rural development. It is, therefore, proposed to make a beginning with an outlay of Rs. 20 crores which, suitably supplemented with the resources of the State Governments and local bodies, would accelerate the programme in this vital area. The new scheme 'grain for work' could also be utilised imaginatively for this purpose

Drinking Water

Although the responsibility for finding resources and executing the programmes of rural drinking water supply is that of the State Governments, Shri Patel said that the central Government should also intervence actively and supplement the efforts of the States He has proposed to make an earnest start in the current year with an additional provision of Rs 40 crores over and above the existing outlays for this programme The allocations would be progressivvely stopped up to carry the benefits of the problem areas over a period of five years

The Finance Minister said that he was not satisfied with the programmes and allocation in respect of the welfare of Harijans, Adivasis and other less developed sections of the people Although these were largely in the States, Plans, it was his intention to take up these matters on a priority basis with the State Governments and Central Ministries concerned so as to add to the effime tiveness of thexe programmes

Power

For power development, a sum of Rs. 234 crores had been provided in the Central Plan. This included Rs. 33 crores for Singrauli Super Thermal Station, Rs. one crore for initiating action on a second Super Thermal Power Station, Rs. 17 crores for inter-State Transmission lines, and Rs 52 crores for nuclear power projects. The State and Union Territories Plans, which account for the bulk of the provision for power, envisage an outlay of Rs. 1,676 crores. Additionally, a sum of Rs. 20 crores is being provided to the Rural Electrification Corporation for systems improvement and for providing I.T. Capacitors for rural consumers, both designed to minimise loss of energy.

Oil Exploration

Emphasising the importance of self-sufficiency in energy, the Finance Minister said that the provision in the Plan for petroleum is being stepped up from Rs. 485 crores last year to Rs. 677 crore this year. Of this, Rs 451 crores will go to the Oil and Natural Gas Commission for their on-shore exploration programmes and for accelerating the pace of off-shore exploration. Recently, a scheme for development of oil and natural gas resources of Bombay High and Bassein fields had been cleared. Indigenous production of crude oil is expected to reach 11.31 million tonnes in 1977-78 against 8.89 million tonnes last year.

A special provision of Rs. 5 crores has been made for Neyveli Lignite Corporation for a new lignite-based power plant with a capacity of 200 MW in view of the difficult power situation in Tamil Nadu. The budgetary allocation for transport and communications will be Rs. 651 crores of which Rs. 302 crores will be for the Railways which have a Plan outlay of Rs. 480 crores

An additional outlay of Rs. 10 crores has been provided for opening more post offices and extension of telephone and telegraph facilities in rural areas The Khadi and village industries, which if properly organised and supported, were capable of generating employment on a large scale A provision of Rs. 35 crores has been made for these in the Plan More funds will be allocated if required These schemes are expected to provide employment for about 25 lakh persons An outlay of Rs 20 crores has been provided for handloom and Rs. 4 crores foi sericulture, which is a substantial step up over the last year

Shri Patel told Parliament that because of shortage of time as also because of heavy commitments of expenditure on ongoing projects, it had not been possible for him to recast the entire fiscal structure in line with "our declared priorities". Also, he did not have the benefit of consultations with the Planning Commission which had been reconstituted recently. It had also not been practicable for him to consult State Governments and induce them to reorient their development programmes in accordance with the priorities

THE Finance Minister, Shri H M. Patel, has proposed to provide that no income-tax shall be payable by individuals and Hindu undivided families whose taxable income does not exceed Rs. 10,000. However, the nil rate slab of income is being retained at Rs. 8,000. Hence, where the taxable income exceeds Rs 10,000, the excess over Rs. 8,000 will be charged to tax as at present subject to the grant of marginal relief in cases where the taxable income exceeds Rs 10,000 by a small margin.

For stimulating industrial development and economic growth, the ges in the rates applicable to Hindu undivided families having one or more members with net wealth exceeding Rs. 1 lakh. The new rate schedule will come into force from the current assessment year and will thus supersede the earlier changes in the rate schedule. This will bring in an additional revenue of about Rs 10 crores in 1977-78.

Compulsory Deposit Scheme

The Compulsory Deposit Scheme in its application to additional dearness allowance was dispensed with from May 6, 1977 However, in mination of the fair market value of a capital asset with reference to a date more than 23 years ago presents practical difficulties, and also capital gains arising from the transfer of asset held over a length of time in a world of rapid and continuing imflation is to a great extent illusory in nature. It is therefore proposed to advance the notional date by ten years, i.e. to 1st January 1964.

In regard to capital gains tax on the sale of residential house it is proposed to exempt the capital gains from tax after the sale proceeds of any asset are reinvested within six

Plan Priorities to be reordered

Finance Minister has widened the scope of the scheme of investment allowance introduced last year. He has proposed to extend the scope of investment allowance to all industries except those which are engaged in the manufacture of specified low priority items such as cigarettes, cosmetics and alcohlic beverages

Presenting his first Budget to the Parliament today, Shri Patel said that his proposals for direct taxes were designed to increase corporate savings, channel more funds into productive investment, accelerate the pace of industrial growth and, at the same time, strengthen the redistributive role that direct taxes must be made to play.

In regard to the proposal for indirect taxes, the Finance Minister said that he had endeavoured to ensure that those proposals did not impinge on the necessities of life. He had sought to raise resources mainly from the less essential or luxury items, while giving relief to some deserving sectors, and simplifying and rationalising the central excise tariff structure generally.

Wealth Tax

The Finance Minister has proposed to raise the rates of wealth tax The existing rate of ½% will continue unchanged on the first Rs 2 5 lakhs of net wealth, but for the higher slabs there will be an increase of ½% over the existing rates while in the highest slab of Rs 15 lakhs, the new rate will be 3½%, i.e. an increase of 1% over the existing rate.

There will be corresponding chan- view of the state of the economy, and the inflationary pressures that exist, it is proposed to continue the compulsory deposit scheme for income tax payers for another two years.

Scientific & Technological Self-Reliance

With a iew to providing an incentive to the users of technical know-how developed in the country, it is proposed to grant investment allowance at the higher rate of 35% on machinery and plant installed for the manufacture of any article made in accordance with the know-how developed in Government laboratories, public sector companies and universities

The closely-held industrial companies are proposed to be exempted from the requirement of compulsory distribution of dividends.

Capital Gains Tax

The Finance Minister has proposed certain changes in the existing scheme of capital gains taxation. At present capital gains arising from the transfer of a capital asset held by a tax payer for a period exceeding 60 months alone are entitled to concessional tax treatment With a view to improving mobility it is proposed to reduce the holding period to 36 months.

In respect of capital assets acquired prior to the 1st January, 1954, a tax-payer has the option of adopting the fair market value of the asset on January 1, 1954 in place of the actual cost of acquisition. Deter- months in shares, bank deposits, units of the Unit Trust or other preferred assets. In order to prevent abuse of this concession, it is required that the assets in which the sale proceeds have been reinvested are held for a period of not less than three years.

Sick Mills

Expressing himself against the take over of sick industrial undertakings by the Government, the Finance Minister has proposed to facilitate voluntary amalgamation of sick industrial units with sound ones by providing certain incentives and by removing impediments in the way of such amalgamation. He has proposed to provide that where an amalgamation is accepted by the Government to be in public interest, the accumulated losses and unabsorbed depreciation of the amalgamating company will be allowed to be carried forward and set off in the hands of the amalgamated company.

Tax Concessions

Expenditure incurred by companies on approved programmes of rural development will be allowed to be deducted in computing taxable profits It is also proposed to accord preferential tax treatment to small scale industries which are set up in rural areas and which begin their manufacturing activity after June 30, 1977. Such industrial undertakings will be entitled to a deduction in the computation of their taxable profits of an amount equal to 20% of the profits. The concession will be avai-

Greater Stress On Integrated Rural Development

lable for each of the ten years commencing from the year in which the undertaking begins its manufacturing activities

The Finance Minister has withdrawn the option given to the companies last year according to which, instead of paying 5% surcharge on income tax, they could deposit an equivalent amount with the Industrial Development Bank of India for a period of five years. This will provide additional tax receipt of Rs 56 crores

The monetary ceiling on donations for charitable purposes qualifying tax exemption has been raised from Rs 2 lakhs to Rs 5 lakhs

The scope of the concession under which 50% of the remuneration received by Indian technicians from a foreign Government or a foreign enterprise for services rendered outside India was exempt from income tax, is now proposed to be enlarged to cover Indian technicians employed by Indian concerns in any branch or office outside India

etc with an annual income up to Rs 10,000. The overall effect of all direct tax proposals would bring a revenue of Rs. 92 crores in the current year.

Duty on Motor Vehicles up

The excise duty on motor vehicles is being raised The rate of duty on motor cars is to go up by 2-1/2 per cent to 17-1/2 per cent. Similarly, the rate of duty on two-wheelers and three-wheeler motor vehicles is proposed to be raised from 9 per cent to 12-1/2 per cent Since it is simultaneously proposed to exempt from excise duty tyres, tubes and batteries supplied as original equipment, the net increase in duty for the two and three wheelers will be about 2-1/4 per cent. These changes will yield a net revenue of Rs 5 1 crores annually.

The present specific rates of duty on pigments, paints, enamels, varnishes, etc are proposed to be replaced by *ad valorem* rates. These are being so adjusted that the duty

acetylene gas. Small scale manufacturers of hand tools and small tols, electric light fittings and polishes, will, however, be exempted in respect of their production up to Rs. 1 lakh. These levies are expected to yield a revenue of Rs 11 crores in a year.

A one per cent general excise duty levied on commodities which did not attract excise duties under any specific heads is now proposed to be raised to 2 per cent. In order to minimise the cascading effect, a set off will be given where these goods go into the manufacture of other goods that are themselves excisable. Since a large number of small units producing a variety of goods fall under this head, it is proposed that no duty will be levied on any unit whose annual turnover does not exceed Rs 30 lakhs. This will replace the existing exemption based on the number of workers. All non-power operated units will also be exempt.

Concession to Handloom

Handloom and powerloom sectors

Defence Expenditure less by Rs. 56 crores. Additional Rs. 40 crores for drinking water for Villages. Crude Oil Out Put Expected to reach 11.31 million tonnes.

While not making any changes in the basic rates of income tax, the Finance Minister has proposed to increase the rate of surcharge on income-tax in the case of all categories of tax-payers, except companies, from 10 per cent to 15 per cent. With the increase in the rate of surcharge, the maximum marginal rate of personal income tax will now be 69 per cent as against 66 per cent at present.

For avoiding inconvenience to small investors in joint stock companies, particularly the investors from rural areas, the requirement of deduction of tax at source will be waived in cases where the dividend paid does not exceed Rs. 250.

Rs. 92-Crore Gain From Direct Taxes

The Finance Minister said that he had taken credit for increasing the surcharge on income-tax and increasing the rates of wealth tax. He had also taken note of the loss of revenue involved in exempting individuals, Hindu undivided families,

on the high cost items will increase by about 5 per cent generally, but that on the cheaper items will remain more or less unchanged

The basis of taxing cinematograph films is proposed to be changed, adopting the value criterion, the revised duty being ten per cent *ad valorem*

At present, the rate of *ad valorem* duty on cigarettes increases as the value of cigarettes goes up The progression in the existing rates is now proposed to be raised In regard to branded bidis, it is proposed to raise the existing duty of rupee one per thousand to rupees two per thousand. These levies would bring in additional revenue of Rs 45 crores a year

A 10 per cent excise duty is proposed to be levied on (1) hand tools, and small tools not already excisable, (2) weighing machines and weigh bridges, (3) watches, clocks and timepieces, (4) electric light fittings, and (5) polishes for foot-wear, metals, cars etc. It is also proposed to levy an excise duty of 12 per cent on

benefit substantially from the Finance Minister's proposals regarding indirect taxation He has proposed to exempt cotton yarn in cross reel hanks up to 20s counts from the excise duty. It is also proposed to exempt cotton yarn of higher counts in cross reel hanks to the extent of 30 paise per kg. Similar concessions are proposed in respect of viscose spun yarn as the handloom sector is now consuming substantial quantities of this yarn.

The power loom sector is proposed to be exempted from the existing compounded excise duty. This will free about 80,000 power loom licensees from excise control

Handloom and power loom fabrics are also proposed to be exempted from excise duty if various types of processing such as stentering and mercerising are done without the aid of power. They are already exempt if bleaching, dyeing and printing are done without the use of power.

The duty on crimping yarn is proposed to be reduced from Rs.

10 per kg. ot Rs. 5 per kg.

Electronics

The basis for duty on electronic items which is now on a varying basis is proposed to be made uniformly on *ad-valorem* basis. The large manufacturers producing radios and transistor sets, tape-recorders, tape-recorder-cum-radios, stereos and hi-fi musical systems will pay duty varying from 15 per cent to 35 per cent *ad valorem* depending on the item and the ex-factory price.

The small manufacturer will be given a uniform concession of 15% *ad valorem* in the rate of duty, that is to say, the corresponding rates of duty that they will pay will vary from nil to 20%. In the case of TV sets the 5% concession rate of excise duty will henceforth be available only where the ex-factory cost of TV set with screen exceeding 35 centimeters is Rs. 1600 or less instead of the existing limit of Rs. 1800. For taperecorders there will be a concessional rate if the ex-factory price does not exceed Rs 500. For calculators, there will be a concessional rate if the ex-factory price does not exceed Rs 175.

To help small and cottage match manufacturing units, it is proposed to double the existing concession of 55 paise for a gross of match boxes to such of those units as are members of registered cooperative societies, or are certified as such by the Khadi and Village Industries Commissions. These units have a large employment potential. Electrical insulating tapes and slotted angles and confectionary articles such as boiled sweets, toffees, candies, are also proposed to be deleted from the list of specific items in the Central excise.

Mini steel plants are in difficulty and their position could be improved if they were provided with fresh melting scrap from the main steel plants without payment of excise duty. It is, therefore, proposed to exempt from excise duty identifiable types of fresh melting scrap cleared from the main steel plants as raw material for the mini steel plants.

Rationalisation

Collection of excise duty on woollen yarn from a number of small spinners has led to evasion and other malpractices. It is, therefore, proposed to replace the excise duty leviable on woollen yarn by an increase in the customs duty at the stage of import of raw wool, waste wool and rags. For wool tops it is proposed to reduce the present rate of excise duty of Rs. 10 per kg. to Rs. 5 per kg. and to make good the loss by increasing the import duty on raw wool suitably. These measures are expected to result in making fabrics using indigenous wool cheaper.

To make good the deficiency still remaining in the domestic demand for watches, it has been decided to allow the import of watches through Hindustan Machine Tools Ltd. To make indigenously manufactured watches and imported watches available to the public at reasonable prices, the Finance Minister has proposed to reduce the import duty on watch parts and watches from 120 per cent to 50 per cent ad valorem.

The import duty on newsprint is to be reduced from 5 per cent to 2-1/2 per cent ad valorem.

For stimulating industrial growth and to enhance the competitiveness of industry, it is proposed to allow the import of certain selected items of capital goods without prior scrutiny from the indigenous angle. At the same time, in order to enable the Indian capital goods industry to meet foreign competition more effectively, it is proposed to bring down the rate of import duty on copper wire bars used for the manufacture of certain larger sized electrical motors, generators and transformers from the existing level of 45 per cent plus Rs. 5,600 per tonne is 40 per cent ad valorem. Similarly, the rate of duty on cold rolled non-grain-oriented sheets, alloy steel, tool steel, special steel, and high carbon steel is also proposed to be brought down from 75 per cent to 40 per cent. Further, stainless steel plates, sheets and strips of 16 gauge and thicker which are used in the manufacture of capital goods and which are to day charged to 120 per cent or 320 per cent duty depending on the gauge, are proposed in future to be charged to 40 per cent duty only. Utensil grade stainless steel of 22 gauge and thinner, which today attracts a duty of 320 per cent, will be charged import duty at 120 per cent. Varying rates of duty are proposed to be fixed for the intervening gauges, taking into account the possibility of re-rolling imported products. It is estimated that the reduction in duties on these copper and steel items will mean a revenue sacrifice of the order of Rs. 36.25 crores at the existing level of imports.

The above proposals will yield Rs 130 crores in the current year thus reducing the deficit of Rs 202 crores to Rs 72 crores. This is a relatively small amount and is likely to have no inflationary effect. □

Provision For Food Subsidies Retained at Rs. 460 crores

Budget Estimate 1977-78

Receipts next year, net of States' shares of taxes and duties, are estimated at Rs. 15,496 crores, and expenditure at Rs. 15,568 crores, leaving a deficit of Rs 72 crores,

Gross Tax Revenue is estimated at Rs. 9021 crores. The States' share of taxes and duties will be Rs. 1802 crores

Thus, the net Tax Revenue of the Central Government will be Rs. 7219 crores comprising Union Excise Duties Rs. 3501 crores, Customs Rs 1730 crores, Corporation Tax Rs 1298 crores, Income Tax Rs 353 crores and other taxes and Duties Rs 337 crores

Non-tax revenue including interest and dividend receipts will be Rs. 2335 crores Market loans are estimated at Rs. 1000 crores, External loans Rs 894 crores and loan Repayments Rs. 1803 crores Small Savings and Provident Fund collections together are placed at Rs 693 crores Other capital receipts are estimated at Rs 1552 crores.

Total estimated expenditure of Rs 15568 crores comprises developmental outlay of Rs. 8862 crores (57 per cent), Defence outlay of Rs. 2752 crores, interest payments of R . 1600 crores, statutory and other transfers to State and Union Territory Governments of Rs. 957 crores and other expenditure of Rs 1397 crores

Developmental outlay of Rs 8862 crores comprises Rs 5314 crores on Economic Services, Rs 854 crores on Social and Community Services and Rs 2682 crores on assistance to State and Union territory Governments for development purposes as also Rs 12 crores of Plan expenditure included under General Services. Of this, Rs. 5790 crores will be under the Plan and Rs 3072 crores outside the Plan. Plan provisions include Rs. 3978 crores for Central Plan, Rs 1645 crores for Central assistance for State Plan and Rs. 167 crores for Union territory Plan. The Central Plan provision includes substantials allocations to Agriculture (Rs. 525 crores), Industry and Minerals (Rs. 1939 crores), Water and Power Development (Rs. 210 crores, excluding Rs 110 crores for the Rural Electrification Corporation programmes in the State sector), Transport and Communications (Rs. 651 crores) and Social and Community Services (Rs. 597 crores)

Other expenditure of Rs. 1397 crores which constitutes only 9 per cent of the total expenditure includes organs of state (Rs. 77 crores), principal taxes collection charges (110 crores) currency and coinage (Rs. 71 crores) subscription to IMF 208 crores), police (Rs. 224 crores), other administrative services (Rs. 186 crores), pensions (42 crores), interest in compulsory deposits (Rs. 122 crores), aid to other countries (Rs. 82 crores) and miscellaneous loans, including loans to Government servants (Rs. 59 crores).

The Rupee-How it Comes & Goes

Out of every rupee which the Government will collect during the current year, 23 paise will come from excise, 15 paise from nontax revenue, 12 paise from loan recoveries, 11 paise from customs, 11 paise from market loans, small savings and provident fund, 10 paise from other receipts, 8 paise from corporation tax, 6 paise from external loans and 2 paise each from income tax and other taxes.

From every rupee thus collected, the Government will spend 37 paise on plan and 20 paise on other development expenditure. Defence will cost 18 paise, interest payments 10 paise, other expenditure 9 paise and statutory and other transfers to State and Union Territory Governments 6 paise.

MORE JANATA TRAINS

SURPLUS RAILWAY BUDGET FOR 1977-78

INTRODUCING the Railway Budget for 1977–78 in the Lok Sabha on June 11, Shri Madhu Dandavate, Minister for Railways, announced that the additional long distance trains to be introduced in the coming years would all be classless Janata trains.

He also announced that instructions have been issued to manufacture a prototype second class coach with more basic amenities so that long distance passengers, particularly on trains with limited stops, did not suffer from lack of these conveniences. He was also considering provision in the second class sleeper coaches of certain long distance trains of some type of, not very expensive, padded cushioned berths so that the common man might travel without having to carry his own bedding.

T'e Railway administration has been instructed to improve the facilities available in the station concources by provision of toilets and benches on a programmed basis.

The Railway Minister said that the Indian Railways would make use of their resources including modern technology to reduce the sufferings of second class passengers. To reduce overcrowding in long distance trains the Railways were considering introduction of trains consisting of double decker coaches on specified routes.

The Railway Minister also announced reduction in the platform ticket rate from 50 Paise to 30 Paise This reduction will be effective from July 1, 1977.

NEW RAILWAY LINES

Shri Madhu Dandavate assured the House that, in consultation with the Planning Commission and the Ministry of Finance, he was exploring all avenues of mobilising more resources for taking up construction of some new railway lines Some of the lines which were urgently needed for in the development of backward areas of the country were the west-coast Konkan Railway linking the southern States, Dallirajahara-Jagdalpur line in Bastar District of Madhya Pradesh, Dharamnagar-Kumarghat line in Tripura, Ernakulam-Alleppey line in Kerala, Bhavanagar-Tarapur line in Gujarat and Dehri-on-Sone to Banjari line in Bihar.

The Railway Minister informed the House that the arrangements were being streamlined and simplified in order to ensure disposal of claims within a reasonable time which normally would not exceed six weeks. For this purpose greater delegation of power to officers as well as to field supervisory staff for settlement of claims has been decided upon Moreover the system of settlement of claims by mobile claims offices would be extended

PLAN OUTLAY FOR 1977-78

The Railway Minister said that as a result of a comprehensive review undertaken by the Ministry of Railways in consultation with the Ministry of Finance, the Railway Plan for 1977–78 has been reduced from Rs 501 crores to Rs 480 crores including Rs. 10 crores for Metropolitan Transport Projects at Bombay, Calcutta, Delhi and Madras. However, he said, no reduction has been made in the allocation for new lines.

Shri Madhu Dandavate said that with the implementation, in just four weeks, of his assurance given to Parliament while presenting the Interim Railway Budget that all the railway employees victimised during May 1974 strike would be reinstated within six weaks, a better industrial climate has been created, in the Railways These swift steps coupled with spurt in economy have improved the freight operations of the Railways in recent months The performance has in fact, been better than anticipated in the Interim Budget. In view of the improved trend, the Interim Budget target of originating revenue earning traffic for 1977–78 has been raised from 217 million tonnes to 220 million tonnes. Accordingly, the goods earnings were now estimated to be Rs 1382 94 crores as against Rs. 1362.76 crores anticipated in the Interim Budget The Railway Minister did not envisage any change in the estimate of passenger earnings which were based on six per cent growth over the previous year The gross traffic receipts had accordingly been placed at Rs. 2110 24 crores against Rs. 2091 44 crores estimated earlier

As regards ordinary working expenses the provision of Rs. 1635.75 crores (net) made in the Interim Budget has been increased by about Rs. 13 crores to provide for additional maintenance and operating expenditure due to the revised traffic target The net surplus of the Railways during 1977–78 was now expected to go up by over Rs 6 crores from Rs 26.45 crores to Rs. 32.50 crores These results would be achieved without any increase at all in the fares and freight rates in the year 1977–78.

Increased Surplus

The Railway Minister said that taking into account the surplus for 1976–77, which would be about Rs. 65 crores, and the increased surplus expected to be achieved in 1977–78 the Railways indebtedness to the General Revenue will go down by over Rs. 37 crores reducing it from Rs. 477.18 mentioned in the Interim Budget to about Rs. 440

Platform Ticket Rate Reduced to 30 Paise

crores.

The Railway Minister said that inspite of the surplus expected during 1977–78 the Railways has still a long way to go to become an economically viable unit. He was confident that he would have the co-operation of all the Hon. Members of Parliament, the public and the organised labour in the process of making the Railways service-oriented and productive.

Paying special tributes to the railway staff, the Railway Minister said that railwaymen have demonstrated their renewed interest in keeping the Railway wheels moving fast so as to serve the public to the best of their ability.

Financial Results for 1976-77

The Revised Estimates for the financial year ended March 31, 1977 were based on the originating revenue earning freight target of 206 million tonnes against 202 million tonnes anticipated in the original budget. Under passenger earnings, on account of the substantial increase in passenger traffic during April to December 1976, the Revised Estimates were kept at about 10 crores.

Estimates 1976–77. Despite provision of a higher liability for payment of dividend to General Revenues (Rs. 211.30 crores against Rs 207.60 crores in the original budget), the Revised Estimates forecast a net surplus of Rs. 35.67 crores against about Rs 9 crores in the original budget

Approximate Actuals 1976-77

The accounts for the financial year ended March 31, 1977 will be finally closed by the end of July 1977. The approximate actuals for 1976–77 compiled by the Railways indicate that the gross traffic receipts may exceed the Revised Estimates by as much as about Rs 40 crores. The increase is mainly under goods earnings due to the actual originating revenue earning loading during the year being as much as 212.27 million tonnes against the Revised Estimates target of 206 million tonnes. Allowing for appropriate increase in the revenue working expenses due to the substantially highr freight traffic, it is now expected that the actual surplus for the year 1976–77 may be of the order of Rs 65 crores against the Revised Estimate

In view of the expectation of further improvement in freight traffic, the target of originating revenue earning loading has been raised in the present Budget for 1977–78 to 220 million tonnes. There is no material change in the quantum of earnings from other sources The gross traffic receipts have been placed at Rs. 2110 24 crores against the interim Budget Estimate of Rs. 2091 44 crores

Under ordinary working expenses, increased provision of about Rs. 13 crores has been made in view of the higher traffic target, while the appropriations to the Depreciation Reserve Fund and the Pension Fund have been retained at the level provided in the interim Budget In the net result, the net surplus of about Rs. 26 45 crores forecast in the interim Budget is expected to go up by about Rs 6 crores to Rs. 32.50 crores This surplus will not only fully meet the budgetted outlay under the Railway Development Fund, including interest payable on temporary loans obtained from the General Revenues but will also leave a balance of Rs. 5.84 crores for transfer to the Revenue Reserve Fund.

No Change in Freight Rates

per cent over the original budget. The estimates of 'other coaching' and 'sundry' earnings were also raised based mainly on the actuals of the preceding year Allowing for a slight increase under 'dues recoverable' attributable to the higher level of traffic, the gross traffic receipts in the Revised Estimates were fixed at Rs. 1987.55 crores against the original Budget Estimate of Rs 1955.82 crores, or an increase of Rs 31.73 crores

Despite the increase in earnings on account of the higher level of traffic, the ordinary working expenses in the Revised Estimates were pegged at Rs 1548.23 crores (net) and this figure was Rs. 3.19 crores lower than the original budget The appropriation to Pension Fund was, however, increased from Rs. 29.50 crores in the original budget to Rs. 34.40 crores in the Revised

of Rs 35.67 crores and the original budget of Rs 8.98 crores As a result of the higher surplus, the indebtedness of the Railways to the General Revenues in respect of expenditure chargeable to the Railway Development Fund and the Revenue Reserve Fund which, according to the Revised Estimates, was expected to be Rs. 461.98 crores as on 31.3.1977, will get reduced to about Rs 430 crores as of that date

Bndget Estimates 1977-78

In the interim Railway Budget for 1977-78 presented on 28.3.1977, the earnings from goods traffic were based on the target of originating revenue earning load in of 217 million tonnes The net surplus forecast in the interim Budget amounted to Rs 26.45 crores after payment of dividend of Rs. 225.56 crores to the General Revenues.

In view of the expectation of higher surplus in 1976–77 and 1977–78, indebtedness of the Railways to the General Revenues as on 31.3.1978 is expected to be only about Rs 440 crores as against Rs. 477.18 crores estimated in the interim Budget

Plan Expenditure

The Railway Plan as presented in the interim Budget provided for an outlay of Rs 501 crores during 1977–78, including Rs. 10 crores for the Metropolitan Transport Projects at Bombay, Calcutta, Delhi and Madras. In addition, a provision of Rs. 2 80 crores was made to meet the working capital requirement for export orders in the Railway Production Units viz. Chittaranjan Loco Works, Diesel Loco Works, Varanasi and the Integral Coach Factory,

(Contd. on page 31)

Forests of Bastar : Veritable Gold Mines

Forestry has a major role to play in Bastar. Through successful management of the Bastar forests it will be possible to start industries like paper mills, plywood, hard board etc. which will provide employment to large number of persons especially adivasis who have been living in these forests centuries after centuries.

SITUATED in the south of Madhya Pradesh Bastar district is the third biggest district in India The first two districts Laddakh (Jammu-Kashmir) and Kutch (Gujarat) although larger in area are sparsely populated while the population of Bastar at 15 lakh souls is more than that of these two districts 71 4 per cent of the people are adivasis and harijans and their life is closely related to the forests Despite being the owners of valuable forest wealth the adivasis of Bastar district live in poverty The reason for this is that the simple and innocent adivasis are being exploited by unscrupulous and cunning persons The State Government have enacted many laws to end their exploitation

The area of Bastar district is 39,171 square kilometres of which 21,689 square kilometres is covered by forests In other words 55 per cent of the total area is forest-clad Of the forest area 9851 sq kilometres is under reserved forests and the rest 11,848 sq kilometres is under protected forests Sal, teak, bija, haldu and many other varieties of timber trees abound in these forests. 37 per cent of the total forest area is under sal, eight per cent under teak and 55 per cent under other tree species Bamboo is also abundant in many parts. According to the pre-investment survey of Forest Resources, 187 lakh cubic metre of wood and 48.40 lakh tonnes of bamboo is available in the forests of the district.

It has been estimated that if the forests of the district are properly exploited, 31,40,000 cubic metre of additional wood and 3,20,000 tonnes of bamboo can be extracted from them every year. At present, for want of demand for other varieties of wood, only teak, bija, sal and haldu are extracted from the forests The quantity of bamboo being extracted from these forests is also very small

EXPLOITATION OF FORESTS

If the forest wealth of Bastar is properly exploited and utilised industries like paper mills, ply-wood, hard board etc may come up Realising the necessity of scientific exploitation of forest wealth for this purpose an intensive forestry division has been established in Bastar

For proper management and development the forests of Bastar are divided into two circles—the south Bastar forest circle and the north Bastar forest circle Both the forest circles yielded a revenue of Rs 3 98 crore to the Government in 1971–72 Following further development of of the forest resources this revenue increased to Rs 11 83 crore 1975–76

The nationalisation of forest product on the one hand, resulted in considerable increase in revenue accruing from tendu leaves and minor forest produce and on the other hand it has provided regular employment in about 6,000 adivasi families living in 149 forest villages of the district. The revenue of Rs 84.12 lakh earned in 1971–72 from state trading in tendu leaves went up to Rs 1.58 crore in 1975–76 State trading in minor forest produce like babul-gum, harra etc. yielded an income of Rs. 15.55 lakh in 1971–72 which rose to Rs. 25.61 lakh in 1975–76.

Similarly, as a result of the nationalisation of timber trade, the State Government earned a revenue of Rs 2.62 crore in 1971–72 from the sale of teak and other valuable timber This revenue gradually increased to Rs 9 38 crore in 1975–76. In 1974 the Government nationalised trade in bamboo The State Government earned an income of Rs 11 90 lakh last year from this trade alone In 1975 trade in sal-seed was also nationalised As a result, in both the forest circles more than 63 lakh quintals of sal-seed was collected and sold yielding a revenue of about Rs 32 lakh

Plantation in a planned manner has also been undertaken to meet the future requirements from the forests and to familitate their scientific exploitation Over the last 28 years, teak was planted in 15,607 hectares, eucalyptus in 8,419 hectares, bamboo in 576 hectares, 'semal' in 11 hectares and pine in 32 hectares in the district

Timber depots have been established at Bijapur, Dantewada, Sargipal, Kondagaon, Narayanpur, Bhanupratappur, Sukma, Konta, Keskal and Kanker. On an average 1,65,000 cubic metre of timber is sent to various places every year from these depots, which provide employment to 1500 persons daily round the year

The development of Bastar district is intimately linked with the development of its forests which yield crores of rupees to the Government. Some of this income is spent by the Government on the welfare of the adivasis and on providing basic amenities of a better life to them. □

KILLICK HALCO DRILLS...

OPEN CAST MINING

KILLICK-HALCO, the pioneers who literally 'broke new ground' in the Indian drilling industry, now offer you a complete range of the most advanced drills in the country—on par with the world's best! This success is in no small measure due to our constant research and development, as well as our technical collaboration with the world famed Halifax Tool Co Ltd, U K

Take open-cast mining, for instance Here, our drills possess an unbeatable record in reliability and efficiency They have been used in every possible angle and position, at such important mining sites as

I. **for Iron Ore**
N M D C, Salgaocar, Chowgule, Dempo, (Goa), Tata Iron, Indian Iron, Hindustan Steel Bhilai, Rourkela etc

II **for Lime Stone**
ACC, Birla Cement, J K Cements, Dalmia Cements, Kesram Cements etc.

III **for Coal**
Eastern Coalfields Ltd
Central Coalfields Ltd
Western Coalfields Ltd
Chasnala Coalfields of IISCO
West Bokharo Coalfields of TISCO etc

IV **Other Mining Applications**, such as in
Hindustan Zinc Ltd
Dalmia Magnesite
Phosphate Mines etc
Bharat Aluminium (Bauxite Mines)

V **Construction Projects**
Kalinadi Project
Godavari Project
Beas Dam Project
to name a few

Whether it be for open-cast mining, civil engineering applications, prospecting or down-the-hole drilling Killick Halco have the right 'down-the-hole equipment, backed by complete and reliable after-sales service

For further information why not write to us today?

Spare parts for Drills are readily available on request!

OUR RANGE INCLUDES

HALCO
625 Truck Mounted
6"-6¼" dia drilling

HALCO
4" Truck Mounted
Self contained
waterwell and
prospecting machine

HALCO 78 HR
29 HR on tracks

HALCO 400 Track
complete with
compressor

HALCO 625 Track
6"-6¼" dia drilling.

TEN PLUS TWO REVISITED

Content and Standards of Proficiency aimed at are more important than determining the duration of courses

V.V. JOHN

DISCUSSION of the ten-plus-two-plus-three pattern, pretentiously called the new pattern of education, has been so ubiquitous and continuous that one might wonder what we shall do by way of educational wrangling, once the pattern is accepted and implemented throughout the country But we need have no fear The current discussion will continue for quite a while And we may be sure that the morning after the pattern is universally adopted, we shall begin discussing how to unbuild it again

This is not as cynical a forecast as it sounds We may recall the fervour with which the eleven-plus-three pattern was forced on the States with much cajoling and bribery, and the upbraiding that was administered to the two States that did not fall in step It may be noted that some of the principal promoters of that pattern are still around to promote the new pattern, and have even been heard claiming that this new pattern was what they had been keen on all along, and that the eleven-plus-three was only a temporary compromise I heard one of them even brazenly declare that the eleven-plus-three was a mistake, and the wise course now is to cut our losses promptly and go over to the new pattern That the losses we are asked to cut involved crores of public investment, and that the compromise played with the schooling of millions of children, do not unduly bother these reformers A friend of mine recently wondered whether the fact that the two principal advisers of the government during all this turn-and-turn-about were men who had no children had any special significance

What is wrong with the debate over the ten-plus-two-plus-three pattern is that it is the wrong debate Every-one should be able to see the foolishness of determining the duration of courses before deciding their content and the standards of proficiency aimed at If the content of courses and the level of proficiencies were determined first, it is possible that we may arrive at a ten-plus-two-plus-three time schedule as a general pattern, though we shall also discover many possible variations of it to suit individual pupils and individual institutions We may also discover what a lot of the traditional curriculum could be scuttled without detriment to standards, and what exciting variations of the curriculum are possible on an institutional basis

In fact, the right approach would be to indicate the skills, and proficiency levels, expected at the elementary, secondary, higher secondary and first degree stages, and institute a network of testing agencies for the certification of such skills and proficiencies at the different stages The number of years spent in school and college for acquiring them should cease to be a prime consideration Even the skipping of certain intervening stages in reaching out to more advanced levels, should be permitted. Attendance rules, not too rigidly enforced anyway when there is student trouble, are allegedly needed because the young would not otherwise learn the advantages of regularity and diligent application It may however be noted that the young people who particularly need this kind of discipline are the ones that nowadays obtain exemptions, from such rigidities through one sort of clamour or another In any event, the mere attendance in classrooms, and the periods of such attendance are no reliable way of assessing the progress of one's learning

Too many Subjects

The new pattern is often commended for the uniformity that will be achieved that way throughout the country And yet, the success of the new pattern and of much else that is being talked about these days, will depend on the freedom that will be available to individual institutions to vary the curriculum and try innovations and experiments. Educational authority could limit its jurisdiction to testing basic proficiencies such as in languages and mathematics, and prescribing areas that students should explore under suitable guidance in individual institutions, or even outside institutions In other words, common external examinations should be limited to a few basic subjects and skills, and other testing and all experimentation should be left to the schools and colleges, subject to the vigilance of the boards of education and the universities Without such freedom, we shall not be able to introduce into our system the non-formal ways of learning that is now being talked about with increasing fervour Without such freedom, it is difficult to see how meaningful programmes of work experience can be planned to match the needs and resources of particular regions and communities. Educational authority should abandon the notion that education will not happen unless it prescribes every move and watches every step

Almost the first thing that the new Minister of Education stressed on assuming office was that, in the school courses designed for the new pattern, there were too many subjects and too many textbooks This overcrowding of the curriculum is obviously the result of a certain administrative anxiety lest something vital should be left out, if the matter were left to individual schools and teachers In the process the simple psychological fact of how much learning could take place if the young were left to themselves in a congenial environment, has been ignored Also ignored was the possibility that the wisdom of curriculum makers in Delhi and the State capitals could profitably be supplemented at many points by experienced and enthusiastic teachers throughout the country

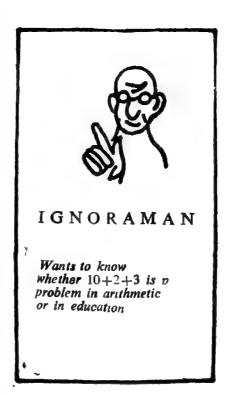
Largely at the Minister's behest, one presumes that some pruning will be done on the quantities of learning earlier scheduled for school classes At a conference recently called by the Minister of Educatio , mention was made of the 700 pages of history, of India and the world, that the NCERT had prepared for the tenth

---
Shri John is a well known educationist

class The NCERT spokesman, speaking rather defensively, indicated how several parts of the two history volumes could be left out. A few kings and battles more or less would not apparently matter. But the real worry was not about the size of the history books, but over the question whether everyone trying to learn everything in school was the best preparation for entry into the world of work or into the world of the higher learning.

A great part of the discussion at the conference mentioned above was devoted to the curricular options that would be available at the 'plus-two' stage The 'vocational stream' received the most attention. The Gandhians disapproved of the 'streaming', and would want productive work to be part of the curriculum for all More important than training for specific jobs, was the need for breaking down the psychological inhibitions among the educated in regard to manual labour.

A question that was asked by one of the teacher participants remained till the end He presumed that the vocational courses of the technological variety would be rather like the courses in the ITIs and polytechnics. He instanced the basic electrical technology, basic airconditioning and refrigeration technology, automobile servicing and maintenance, and elementary sanitary technology, mentioned in the Central Board of Secondary Education's list of vocational courses for the 'plus-two' stage. His information was that, in Delhi alone, there were on the live registers of the employment exchanges 6000 holders of diplomas of ITIs and polytechnics waiting for the jobs for which they have been trained; and there is an annual output of 4000 such diploma-holders in Delhi. He wanted to know whether a different prospect awaited those who would take the vocational courses at the higher secondary level.

To use the distasteful phrase now in common use, these unfortunates will be 'siphoned off' into the world of work, but the world of work may not have any use for them All that may be achieved is a small reduction in the vast numbers that rush annually into the universities. Among the two 'streams', there will be no genial singing of 'Oh, ye'll take the high road, and I'll take the low road'. For those that take the low road would feel that they have been tricked into an inferior status, while the privileged ones proceed to the university, to a degree, and to better job prospects. There will be protests against this trickery, and we shall soon be working on another pattern as the final answer to our educational ills


The designing of 'terminal' courses for any section of pupils is a piece of educational stupidity. Education can be terminal only in the sense in which Mark Twain once said that education was not as sudden as massacre, but in the long run it was more deadly. Anyone who is told that he is doing a terminal course is not likely to be filled with a sense of impending achievement, but is almost sure to be resentful that he should be denied the larger opportunities that accrue to those in the 'academic stream'. As for employment prospects the outlook is at the moment gloomy for both streams, but the university man is able to survey a larger vista

But the 'plus-two' stage could become crucial if it were used as a way of helping students to ascertain their own aptitudes, and if both careers and further studies are available to all students, and the vocational stream does not involve any inevitable 'siphoning off'. The success of courses that fit young people for direct entry into the world of work wolud also depend not only on the ready availability of work, but also on an equitable wage structure in the country, under which what counts is the work done and not the academic credentials one produces.

Let me end this on a personal note. Besides having been a teacher for many years, and an educational administrator, I have also had the advantage of belonging to a large family where my lot has been cast not only among my sons and daughters but also among the battalion of nephews and nieces. In the last thirty years, they have been educated in different parts of the country, and have been through a variety of patterns of schooling, such as the ten-plus-two-plus-two, ten-plus-one-plus-three, eleven-plus-three, and ten-plus-two-plus-three. Their academic performance has been of varying quality, some good and some not so good. But it is my conviction that the quality of the performance and the quality generally of the end products of our school and college system, owed very little to the different time-patterns that the schools and colleges followed. They owe a great deal to the quality of the schools and colleges they have been to, but none, so far as I could see, to the time schedules they were put through The moral I draw from this family experience is that the quality of our education will not owe anything to the sort of numerology that is engaging the attention or reformers; it will depend on other, and more intellectual and moral inputs □

Weed Can Replace Gobar Gas

Waterhya cinth, the troublesome weed, can be used in place of cowdung to produce domestic fuel gas, according to scientists at the Central Mechanical Engineering Research Institute in Durgapur. Water hyacinth is available all over the country. It covers an area of 200,000 acres in Bihar alone. CMERI has found that it has some advantages over cowdung. The operation of a gobar gas plant requires five cattle, which an average villager does not possess. Water hyacinth decomposes quicker than cowdung and yields 50 per cent more fuel gas.

Integrated Rural Development Planning: Role of Panchayati Raj Bodies

H.R.S. IYER

PANCHAYATI raj institutions have not served as effective channels for participation in national development planning even in the restricted sense of making the elected representatives of panchayati raj bodies aware of the planning objectives. The national Planning Commission has not been able to envisage a realistic role for Panchayati raj bodies in their planning exercises. In other words, panchayati raj bodies have not obtained a share in the process of national planning and development that calls for their participation

The planning apparatus at the state and national levels have rarely shown any genuine interest to seek the purposeful and meaningful involvement of the panchayati raj bodies in their own policy formulation and decision-making processes In fact, panchayati raj bodies have been merely an agency in the implementation of the plans since the formulation of development plans and programmes, their objectives, priorities, physical and financial targets, etc have invariably been decided by the Union and State Governments and implemented through the governmental agencies including panchayati raj bodise.

Planning is a two-way process

There is a school of thought which believes that planned development requires centralised planning There is another school of thought which says that integrated rural community development and area development needs integrated decentralised planning Although there are three approaches to social change namely evolution, planning and revolution, in most countries plan social change is accepted as the strategy for social change There are three models namely centralised planned change, decentralised planned change and a combination of both. Of late, the importance of both centralised and decentralised planning is recognised by the planners and policy makers for to remedying the short-comings of national planning and for developing the socio-economic conditions of the entire people and all areas. In short, planning is a two way process namely planning from above and planning from below and both are necessary for integrated national development

Shri Iyer is Professor of Panchayati Raj, College of Post-Graduate Studies, Gandhigram, P.O. Madurai

In most countries, planning activities in the social, political, economic, physical fields etc. are undertaken at the national level. These include not only the underdeveloped and totalitarian countries but also the developing and more developed democratic or socialist countries Yet there is room and possibility for decentralised planning to make up for the short-comings of centralised planning.

There is a view that the process of planning and the process of democratic decentralisation are incompatible to each othe.. In other words, planning and panchayati raj are incompatible to each other. There is yet another view that panchayati raj and planning is possible and essential at least at the panchayati raj level There is no question of panchayati raj versus planning by panchayati raj plus planning with a view to accomplishing the goals of panchayati raj.

Let us examine the rationale and need for integrated decentralised planning Integrated decentralised planning is indispensable not only for the growth and development of Panchayati raj but also for the success of national development effort Whatever the form of government, parliamentary or presidential, federal or unitary, totalitarian or democratic, it is utopian to manage functions from the capital. In a unitary form of government, the entire functions of government are distributed among various governmental agencies. But in a federal structure, since there are three tiers of government namely, union, state and local, there is need for planning apparatus and activities at all the three levels.

Our country is wedded to establishing a democratic welfare state and a democratic socialist society Hence it follows that the government is mainly concerned with the balanced development of all the areas. Both the urban and the rural people should be provided with basic minimum amenities and also to improve their socio-economic conditions

Even Distribution of Benefits

The need to spread the fruits of planned development over as wide an area as possible was recognised by the planners even in the First Five Year Plan. In other words planned economic development should result in a more even distribution of benefits, a fuller life of an increasingly large number of people and the building up of a strong integrated democratic nation. The populist

goals of economic growth with distributive social justice as well as meeting the national minimum needs programmes demands overall development of the entire people and the balanced, decentralised and optimum rate of growth or development of all areas, which can be possible only through integrated decentralised planning. The need for removing regional social and economic imbalances through integrated decentralised approach cannot therefore be overstressed. There are a number of underdeveloped pockets in many parts of the country There is also divergence in the level of development in various parts of the country The removal of regional imbalances or integrated, balanced and co-ordinated area development is possible only through integrated decentralised rural community development and area developament planning

This calls for not only the preparation of a separate integrated area development plan for each rural district, but also high priority in the allocation of industries in backward areas and more allocation of union and state funds to backward areas compared to developed or advanced areas with a view to minimising the gap between the developed areas and backward areas thereby accelerating the development of backward areas. The allocation of funds in different areas should depend on the real needs of the people, level of development and the potentialities of the areas. In short, integrated decentralised planning is a means for promoting, the process of integrated area development planning

In such a vast country like ours it is very essential that there is decentralised planning in order that the people are inspired to have direct participation in development and welfare plans and programmes Authentic integrated rural community development and area development requires authentic rural community participation in the process of integrated rural community development and area development planning. Authentic community participation in the formulation of rural development and welfare programmes can be a reality only when rural development and welfare programmes are based on the needs, and aspirations, of the rural community. In short, there is an indispensable connection between authentic community participation in plan formulation and plan implementation.

Peoples' Participation

It must be remembered that community participation and community development are synonymous and panchayati raj system came into existence as a result of the failure to evoke community participation in rural development and welfare programmes. The rural community should be given opportunties to take part in the process of decision making pertaining to their own development through governmental agencies including panchayati raj bodies and non-government organisations including voluntary social welfare organisations.

This psychological support of the rural community is indispensable for tapping and utilisation of manpower resources or under-used community resources as well as mobilisation of material resources. In other words, with active participation, resource mobilization for legal plans becomes easier. Village panchayat can make a better adjustment between overall development and welfare needs of the rural community on the one hand and human and material resources on the other. Panchayati raj bodies are in a better position to identify and develop the backward areas in their jurisdiction by allocating proportionately larger resources in their budgets for their maximum development in order to supplement the allocation of a large share from the total development funds of the union and state governments to under developed areas

Planning activities relate not only to the future but also to the present. It aims at solving the problems in the existing social and economic situations of the people and also taking constructive and calculated efforts to prevent the occurrence of such situations in future. In other words, planning has a curative, preventive and promotive dimensions. Panchayati raj bodies can thus undertake these responsibilities of planning of rural development and welfare programmes which aim at improving the existing socio-economic conditions of the people as well as their future.

Pre-requisites for Integrated Development

Let us now examine the requirements of integrated rural development planning. Firstly, the planners and policy makers, should recognise the importance of integrated and decentralised community development and area development plans and programmes and the crucial role of panchayati raj bodies. Not only that there is a need for evolving integrated rural district development planning, but also there should be planning and administrative apparatus at different levels. There should be decentralisation and devolution of power and responsibility to the elected representatives of the three tiers of panchayati raj in the field of rural community development and area development planning and administration. There should be a separate pan chayati raj sector exclusively for integrated rural community development and area development planning. Panchayati raj should be free to plan, of course, in conformity with the national goals. The relative roles of state and panchayati raj bodies in integrated national planning, development and administration should be clearly specified and well defined. The state governments should be more aware of the values and possibilities of involving panchayati raj bodies in planning activities. Both the officials and non-officials of panchayati raj bodies should have adequate knowledge and experience in the process and techniques of planning. Hence the need for training of officials and non-officials in the process and techniques of planning and skills in the planning work which, inter alia, include objectives of planning, their responsibility towards the community, knowledge and skills of planning in their specific areas etc. There should be adequate allocation of funds not only in the Five Year Plans and annual union and state plans but also at the disposal of panchayati raj bodies with a view to developing underdeveloped areas.

One of the pre-requisites for integrated decentralised planning is a radical change in the existing power relationship between the state and panchayati raj bodies. Panchayati raj bodies should have adequate powers at their disposal to make decisions pertaining to rural community development, and area development planning. The existing panchayati raj bodies are not strong enough and well organised to undertake planning activities.

Integrated rural community development and area development planning calls for decentralised and democratic mechanisms for each rural district. The formulation of plans should be entrusted to a rural district development board consisting of officials of district level development departments and non-officials of panchayati raj bodies. The village

(*Contd. on page* 28)

FOR A BETTER TOMORROW

One of the many abundant resources of India are its children the future architects of our country. History will judge us on how well we prepare, educate and use them for fulfilling their destiny as the future citizens and statesmen of the country.

An unprecedented educational revolution has occurred in our country during the last 30 years. Primary education is free in all the states and compulsory in most of the states. Eighty six per cent of the children in the 6-11 age group are today at school. There were about 85.8 million students in schools in 1973, equal almost to the entire population of Bangladesh or Bulgaria. History has seldom seen such a tremendous explosion of human mind within so short a space of time.

Forestry And Its Eco-System

L.C. SHARMA

Forest area has been gradually diminishing over the years in India due to various reasons. But in certain regions reckless cutting of forests by tribals practising shifting cultivation has not only reduced the forest area but has also initiated soil erosion and floods. The Government is aware of the seriousness of the situation and has initiated a number of programmes in the Fifth Plan to wean the tribals from the bad practice of shifting cultivation and to stop further encroachments on forest lands.

For many years the action of man in the country has been responsible for diminishing tree growth by burning, clearing and felling trees for fuel, or by making way for agriculture, settlement or industry The deterioration which was slow formerly has been speeded up with the explosion of population. Since India is an agrarian country, additional land is being constantly demanded for cultivation, both for normal cultivation and for shifting cultivation. The impact of these practices is so great that the forest area is being reduced very rapidly.

Forest degradation and removal are not the only evils which result from over-cutting. The removal of forests from the mountains and hills has initiated or encouraged soil erosion by gullying or sheet-wash, or has prompted landslides. The soil removal from the land has helped silting up river beds and thus caused flooding or reduced the possibilities of navigation in the rivers. It has also endangered the economic life of our costly multi-purpose river valley projects which are so valuable for the nation.

Dr. Sharma is Research Officer (Forest Resources) Planning Commission, New Delhi.

Though shifting cultivation is practised in sixteen states of India, the greatest harm has been caused in the tribal belt of Orissa, Madhya Pradesh, Andhra Pradesh and the North-Eastern region. It is known differently in different states as 'jhum' in Assam, 'kumri' in Karnataka', 'podu' in Telgu, 'podu' and 'binga' in Orissa, 'dhai' or 'dahiya', 'bewar', 'bippa' in Madhya Pradesh. According to an F.A O. estimate this type of cultivation dates back to the neolithic period. The explosion of population has brought more area under jhum cultivation and thus depleted the soil fertility. Rotation period which used to be 30 years formerly has been brought down to about 3 to 5 years. Thus a stage has been reached when this malpractice can no longer be tolerated. It is estimated that with this type of cultivation about ten centimetres of soil is washed down even from moderate slopes in one cycle in Assam hills. The soil thus washed away gets deposited in the dams and reservoirs, thus reducing their economic life.

No precise figures about the extent of land affected by shifting cultivation are available, but according to rough estimates it engulfs about one million hectares of land involving about 0.5 to 0 6 million families.

There are mainly two effects which are attributable to shifting cultivation, namely: (1) changes in soil properties—physical, chemical and biological—which are consequential to felling and burning of forests. The action causes such rapid decline in soil fertility that it compels the tribals to abandon the land in quest of fresh land; and (2) ecological aspeots

An important destructive effect of shifting cultivation can be seen on the organic matter and human reserves in tropical soils. In the process of burning and clearing the natural forest growth, the soil loses its vegetative cover. Most of the litter is consumed in this fashion since the soil is left with a thin layer of ash. The top soil is exposed to decompose rapidly so that the ash is washed down into the soil It may be washed off the surface due to exceptionally heavy rains or relatively impermeable soils, or slopes. Furthermore soil erosion is dependent upon the extent the soil is exposed during the subsequent cropping cycle. The surface erosion is likely to be heavier than before if the land is cleared again during the second year for another annual crop rather than to leave it under semi-permanent crop.

It is unfortunate that no data exists to prove the changes brought about by shifting cultivation in the soil properties. Nevertheless there is evidence that excessive use of fire under tropical conditions coupled with overgrazing or shifting cultivation causes degradation of plant cover and oil condition.

Various organisations, institutions, and Committees have tried to assess the problems of shifting cultivation in the past. Some States/Union Territories have implemented Research/pilot schemes but these schemes have never been coordinated. However, the tribals have been practising shifting cultivation for generations. The practice will have to be stopped, but gradually and with their consent. A scheme for the control of shifting cultivation has been formulated with an outlay of Rs. 14 million in the Central Sector. The scheme will start in the current year in Madhya Pradesh, Orissa, Tamil Nadu, Andhra Pradesh as well as the States/Union Territories in the north-eastern region

In the State Sector, substential outlay has been provided under soil conservation and jhum control schemes, especially in the north-eastern region, where jhum is a serious problem. The State-wise outlays for the Fifth Five Year Plan are as uder:

	Rs Million
1. Assam	38.00
2. Meghalaya	40.00
3. Manipur	20.00
4. Tripura	30 00
5. Nagaland	43.30
6. Arunachal Pradesh	14.40
7. Mizoram	22.50
Total	208.20

The entire outlay of Rs. 40 million in Meghalaya will be devoted to jhum control. In case of other States the programme of soil conservation will help in jhum control.

On the recommendation of Planning Commission in 1973 the Ministry of Agriculture and Irrigation constituted a Board to keep under constant review the planning and preparation of schemes for the settlement of shifting cultivators; arrange for the execution of these schemes through State Governments, and to ensure that these areas received the attention they deserved.

Rationalisation of shifting cultivation would involve (i) all the necessary protective measures to be taken in accordance with sound agricultural practices; and (ii) allowing a period of long fallow to the land to recoupe its lost fertility. Such measures are as follows:-

1. **Terracing should be done before cultivating a certain plot. It will conserve soil and moisture. Each practice is already in existance in some parts of Nagaland, Jaintia hills in Meghalaya and Apatani plateau in Arunachal Pradesh.**
2. **Mixed culture like cash and fruit crops viz. cardamom, coffee cotton, chillies, pineapple, jack fruit, banana, etc., besides the crops of rice, maize, millets, etc. should be taken up.**

A view of hills clothed in dense jungle

3. **Mixed crop planning should be introduced during the cycle; and**
4. **Windbreaks should be created and contour 'banding, should be introduced.**

Plantations of fast growing suitable species should be grown in conjunction with agricultural crops. viz. agro-silvi system or the *taungya* method. This type of cultivation will bring additional income to the tribals as compared to the traditional form adopted by them at present.

A provision of alternative employment to the shifting cultivators should be made to relieve the pressure of population on land. This might help improve, too, their economic conditions without interfering with their way of life.

Degradation of forest

In early times many forest areas were cleared for extension of agriculture. The remaining forests were used for fuel (charcoal) by the developing industries and wood for constructional purposes. Till the nineteenth century wood was used as essential component for the shipbuilding industry. This process led to depletion of forest reserves. A major railway system which required millions of sleepers was developed during the nineteenth century. Enormous quantity of logs was used in the coal-mining industry. Finally the pulp and paper industry put up the forest evergrowing demand for the wood-callulose for paper manufacture. However, one should not forget that forests cannot regenerate naturally. If too many trees of a species are removed, the production of seeds and consequently of new trees is of course hindered. The forests in Kumaon were degraded because the Rajah kept on cutting areas and never thought of replanting them. The "Muafidars" (right holders) of Dehra Dun cut down the trees from the hill slopes near Mussorie. No automatic regeneration of trees took place there. In fact it brought about heavy soil erosion.

Land is claimed for so many uses—agriculture, urban development etc. Some are complementary uses such as forestry. Agriculture and recreation are other uses. The

location of some lands makes them so highly valuable for urban and industrial development, for urban recreation and for construction of roads, that neither forestry nor agriculture can compete for them. Forestry in India is unlikely ever to be a hard competitor for large areas of fertile land. Rather agriculture may take away some chunks of good forest land for crop production. According to latest law not more than 20 acres of forest land can be taken away for agricultural purposes.

Despite the National Forest Policy envisaged in 1952 prescribing that India as a whole should aim at having at least one-third of its total land area under forests, about 3.4 million hectares of forest lands were deforested during the period 1951–52 to 1972–73 out of a total of 75 million hectares of forest land. Deforestation up to 1951–52 to 1968–69 was about 1 7 million hectares. The pace has been so quick as to cover another 1 7 million hectares from 1969–70 to 1972–73.

However out of the total area of forest land lost i.e 3 4 million hectares during 1951–52 to 1972–73 the maximum area lost is to agriculture viz 71.5 per cent. Next come the River Valley Projects with 11.8 per cent Miscellaneous purposes account for 11.4 per cent. establishment of industries 3 7 per cent and construction of roads etc., 1.6 per cent. Another important aspect is that among the States, Madhya Pradesh tops the list in losing nearly 46 per cent of its total area of forest land Of this agriculture took a toll of nearly 42 per cent. West Bengal is second with 9 percent forest area lost Of this the agriculture absorbed nearly all the area, other purposes being negligible The position in respect of Union Territories is not different from the States. Of the total forest area lost viz. 2.90 per cent, agriculture shared 1.50 per cent.

Soil Erosion in the Himalyas

According to Hans Christoph Rieger three factors are chiefly responsible for causing floods and soil erosion in the Himalayan forests. They are :

1. A natural weather process in the hills and the transportation of fertile sediments to the plains,
2. Effects of population pressure on the existing forests, the soil and the water; and
3. Effects of migration on a destruction of the mountain environment.

According to him the first is incorrigible. But, the Government of India have tried to deal with this problem not only in the Himalayan Ranges but also in all hill catchments in the country This programme was started in 1962 and it is still continuing. Till the end of the Fourth Plan the Government had spent Rs. 460 million on this. A sum of Rs 320 million will be spent on the programme during the Fifth Five Year Plan

The Government is likely to take up the following projects with a view to identifying the following subcatchments;

1. Sub-catchments which have a substantial vegetation to prevent soil erosion.
2. Sub-catchments which have a moderate vegetation to promote some soil
3. Sub-catchments were soil erosion exists in a substantial degree owing to lack of vegetation and needs immediate attention towards corrective measures.

The third group of sub-catchments needs tackling within a reasonable time to minimise soil erosion in the catchment and to prevent sedimentation in the irrigation projects The projects taken up so far cover an area of 70 million hectares. Of this nearly 7 million hectares fall in the third category. Of this about one million hectares had been covered till the end of the Fourth Plan though not on a sub-catchment basis Obviously the work was scattered throughout the catchment. As such the results were not commensurate with investment. The programme in the Fifth Five year Plan is strictly on the sub-catchment basis to make investment result-oriented.

There are a number of soil conservation programmes which do not form part of any catchment area. The problem of soil erosion is so great that it will be something if the Government is able to break its back even in the sixth and seventh plan period. For this an investment of Rs. 2,000 million will be required

Floods can be controlled if soil conservation measures are adopted in the catchments of the major rivers and their main tributaries The Government of India is at present busy tackling the catchments as follows:

The Government of India has yet to tackle the Jhelum in Jammu & Kashmir and the other rivers of Himachal Pradesh and Uttar Pradesh including the Jamuna and its tributaries and the tributaries of the Ghagra The Brahmaputra arising in China is a major problem and so also the river Gandak and the Kosi and its tributaries, all arising in Nepal These projects do not fall under the jurisdiction of the Government of India, it is planned to build some

(2000 hectares)

River Valley Project (Himalayan Region)	State	Area of the catchment	Critical area requiring treatment	Area treated upto the end of Fourth Plan
Bhakra (Sutlej)	Himachal Pradesh	1,820	273	111.30
Pong (Beas)	-do-	685	103	5 01
Giri Bata	-do-	246	37	—
Kalagarh (Ramganga)	Uttar Pradesh	363	54	34 24
Pohru	Jammu & Kashmir	186	28	8.14
Teesta*	Sikkim	1,266	190	—
Pagladia*	Assam	83	12	—
Total		4,649	607	158.75

* Newly included projects

reservoirs. This programme will take few decades to complete. Mean while the soil erosion programme can be tackled in the major tributories where the problem is acute. This can be tackled on the same basis as the programme of the catchment of major projects. Such catchments and sub-catchments should be identified in the Himalyas within the jurisdiction of Government of India. In such areas the programme of soil conservation and afforestation can be taken up in the same way as it is being done in case of the major irrigation projects

The programme is meant for the areas where erosion is substantial—probably 10 per cent of the total area. If this area is scientifically covered, it is hoped that nearly 50 per cent of the sedimentation from the catchments will be saved. Simultaneously other soil conservation measures of middle level intensity will have to be taken up in hand

It is noticed that substantial erosion is occurring in all those areas where a large number of roads have been constructed particularly in the Himalayas during the last 25 years Obviously our engineers have not taken adequate care about stabilising the embankments or Protecting the hill sides where cutting have taken place. This has resulted in erosion in these projected patches leading to deterioration of the road embankments, and causing land slides in the steep slopes areas In future the engineer who build the roads in the hills should be made responsible for soil stabilising and afforestation of the exposed areas. The Forest and the Soil Conservation Department can issue suitable guidelines in this respect. The expenditure could also be made a charge on the road construction.

To deal with devastation of village and community forests round human habitats throughout the country a scheme of "social forestry" has been started to provide—

1. Mixed plantations in waste lands, panchayat lands and forest areas
2. Development of social forestry including reforestation of the degraded forests and raising of shelter belts

The Darjeeling hills are being treated under a compre ensive hill area development programme and a Forest Corporation programme. This programme is the outcome of the disastrous Teesta floods.

The development of social forestry will take into account degraded forests They will be taken up for intensive plantation and maintenance of quick growing fuel trees and small timber. Priority will be given to those where fuel is needed more and more on account of the pressure of population The centre will bear 50 per cent of the cost of the Centrally Sponsored Scheme Another solution of this problem lies in the fact that every forest department fells substantial coupes for timber production every year. The actual timber forms about 50 per cent of the tree and the rest 50 per cent becomes lops and tops and shavings Most of this material rots in the interior forests This material can be linked up with the consumption areas in the populated zone by providing depots where fuel can be sold at cost price This scheme is yet to be started

India Should have one third of its total land area under forests

A large number of nomadic people depend on cattle and sheep rearing in the Himalayan Ranges. These people have grazing rights in certain high hill ranges during summer and in certain lower ranges during winter. With the increase in population the demand for meat is increasing day by day These nomadic people increase the stock in their flocks which need more fodder. As a result natural fodder ranges get over-exploited Some measures must be taken to set right this imbance and to save large fodder areas from damage before the evil of soil erosion makes it irreparable.

The nomads also keep a large number of goats along with cattle and sheep in their flocks. While cattle and sheep graze on both side of the migration path for some distance twice a year while going and coming back, they do not create a serious threat to vegetation. It is the goats that are the real trouble-shooters They pull out the roots while grazing leaving no chance for the revival of the plant during the rainy season Foresters do not like goat population grazing in the forests but traditional rights and habits of the right holders continue Goats should be banned in these areas by law as Pakistan has done in this respect.

It has been suggested to the States that they should intensify the production of high quality grass in the existing ranges with the help of chemical fertilizers In the first instance it was decided to spray the ranges with chemical fertilizers with the help of a helicopter but later it was found that the helicopter are unable to reach these ranges To overcome this difficulty it was suggested to the States that they should given fertilizers to the nomads to spray by hand By making the nomads participate in such operations the Government will also be instilling in them a sense of responsibility in maintaining the pasture lands Experience shows that by leaving the ranges fallow for a year after fertilizing good seed generater of fooder can be seen there

The responsibility of tackling this problem should be shared by the States, Centre and the nomadic people (*Contd on page* 31)

UNEVEN PERFORMANCE OF

Sharp Increase in Industrial Prod

ECONO

THE Pre-Budget Economic Survey presented today in Parliament by Shri H. M. Patel, Finance Minister, has taken a cautious view of the performance of the Indian economy in 1976-77.

It characterises the performance as uneven and draws attention to several areas where the economy seems to have fared worse than in 1975-76

Gross national product is estimated to have increased by less than 2 per cent as compared with an increase of 8.5 per cent in 1975-76 There was a decline in agricultural production of 5-6 per cent as compared with an increase of 15 6 per cent in 1975-76. Foodgrains production is estimated to have fallen to around 111 million tonnes from 120.8 million tonnes in 1975-76 There was a serious drop in the output of edible oils and cotton production did not show any improvement.

Prices rose by 11.6 per cent during the year because of the shortfall in the production of some of these commodities. Money supply increased by 17.1 per cent and added to the apprehensions about inflationary pressures. Industrial investment did not show any great signs of revival Most important of all, there were no signs of any improvement in the unemployment situation

On the other hand, the production of sugarcane and jute and mesta registered an increase. Industrial production increased by 10 per cent, something which had not happened over a decade A massive procurement operation was successfully completed and stocks of foodgrain of 18 million tonnes were built up by the end of the year. Exports rose by 23 per cent in 1976-77 What is striking is that this was due as much to an increase in volume as in value Imports declined by 7 per cent in sharp contrast to 1975-76 and there was a small surplus of Rs 72 crores Inward remittances have also increased substantially during the year and India's foreign exchange reserves amounted to Rs 2,863 crores at the end of the year after repayment of Rs 303 crores to the I M F

According to the Survey, this brings out clearly the problems which the Indian economy is facing at present The rate of growth of the economy has been much below what is neded to bring about a perceptible increase in the standard of living of the people The rate of growth is low because agricultural production which amounts for nearly half of GNP is not increasing rapidly The growth impulse of the green revolution seems to have exhausted and it has not been able to replace it with anything in rice r coarse grains. Pulse production seems stagnant as also that of commercial crops with the exception of sugar cane

Industrial growth also has t low barring the year 1976-77 I of demand seems to be the r reason for slower production consequent excess capacity In trial investment has not rev significantly. On the contrary, sures through sickness seem be increasing Export growth mitigated the impact of these fac to some extent and will continu do so But in an economy w exports account for about 5 cent of the GNP, they cannot the instrument of leading the nomy out of this low growth ph
